VA Office closes at 4:30PM

Saco VA Clinic

10,798 SF

$40 \div \frac{10,798}{1000} = 3.70$ trips/1000

$17 \div \frac{10,798}{1000} = 1.57$ trips/1000

F. TRIP COMPOSITION

Vehicle Trip Composition: This report has assumed all vehicle trips generated by the proposed project are "*primary*" or "*new*" vehicle trips to the area street network.

G. TRIP DISTRIBUTION

Site Trip Distribution: The 10th Edition of the Institute of Transportation Engineers **TRIP GENERATION** publication provides the following trip distributions rates for a proposed Clinic building:

Land-Use Code 630 – Clinic

AM Peak Hour Street)	= 78% enter/22% exit
PM Peak Hour (Street)	= 29% enter/71% exit
AM Peak Hour (Generator)	= 58% enter/42% exit
PM Peak Hour (Generator)	= 46% enter/54% exit

Table 1, as follows, summarizes the peak hour directional distributional volumes for the proposed CBOC site:

Table 1
Site Trip Distribution Summary

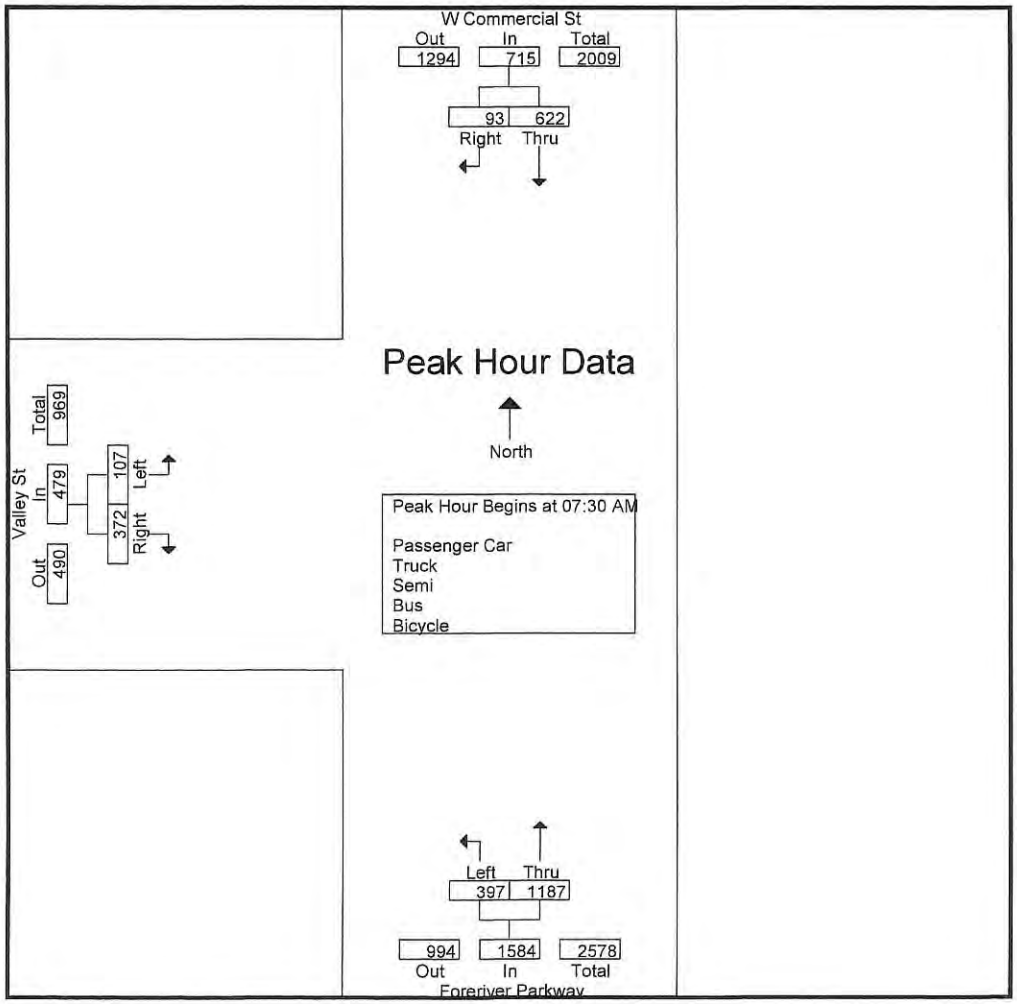
Peak Hour Time period	CBOC Building Trip Distribution Volumes		Total Trips
	Enter	Exit	
AM Peak Hour (Street)	179 trips	50 trips	229 trips
PM Peak Hour (Street)	59 trips	145 trips	204 trips
AM Peak Hour (Generator)	189 trips	136 trips	325 trips
PM Peak Hour (Generator)	132 trips	156 trips	288 trips

Accordingly, in the morning peak hour of the street the heaviest volume of trips (179 trips) enters the site and in the evening peak hour a reverse pattern occurs with 145 trips exiting the site. The remaining trips (50 trips) in the morning peak hour will exit the site and (59 trips) in the evening peak hour enters the site.

Projected trip patterns occurring during the mid-morning and mid-afternoon peak hours of the site are estimated at 189 trips entering the site in the mid-morning peak hour and 156 trips exiting the site in the mid-afternoon peak hour. The remaining balance of 136 trips in the morning peak hour exits the site and the remaining trips (132 trips) in the afternoon peak hour enters the site.

H. TRIP ASSIGNMNET

Vehicle Trip Assignment: The Department of Veterans Affairs provided general residency information for employees presently working at the 144 Fore Street facility in the City of Portland that shows the majority of employees reside in Portland, South Portland, Yarmouth and Falmouth. They also stated the expected service area of the proposed clinic will encompass the majority of Cumberland and York counties. A trip assignment model, based upon 2018 population trends for the major communities in Cumberland County, was developed and applied in the assignment of the site trips to the West Commercial Street corridor. This process expects approximately 85% of the site trips, which include both patients and staff trips, will arrive/depart the proposed site with a westerly orientation along West Commercial Street. The remaining site trips (15%) will travel to/from the east on West Commercial Street to reach points in the eastern section of the Portland Peninsular and/or cross the Casco Bay Bridge to either Cape Elizabeth or the eastern section of the City of South Portland.



Site trips traveling to/from the west of the proposed 113 West Commercial Street site were further assigned to the roadway system based upon existing traffic data gathered at both the West Commercial Street/Valley Street and West Commercial Street/Fore River Parkway intersections. Copies of the traffic data are attached.

Figures 1 and 2 illustratively present traffic assignments, respectively, for the morning and evening peak hours of the street.

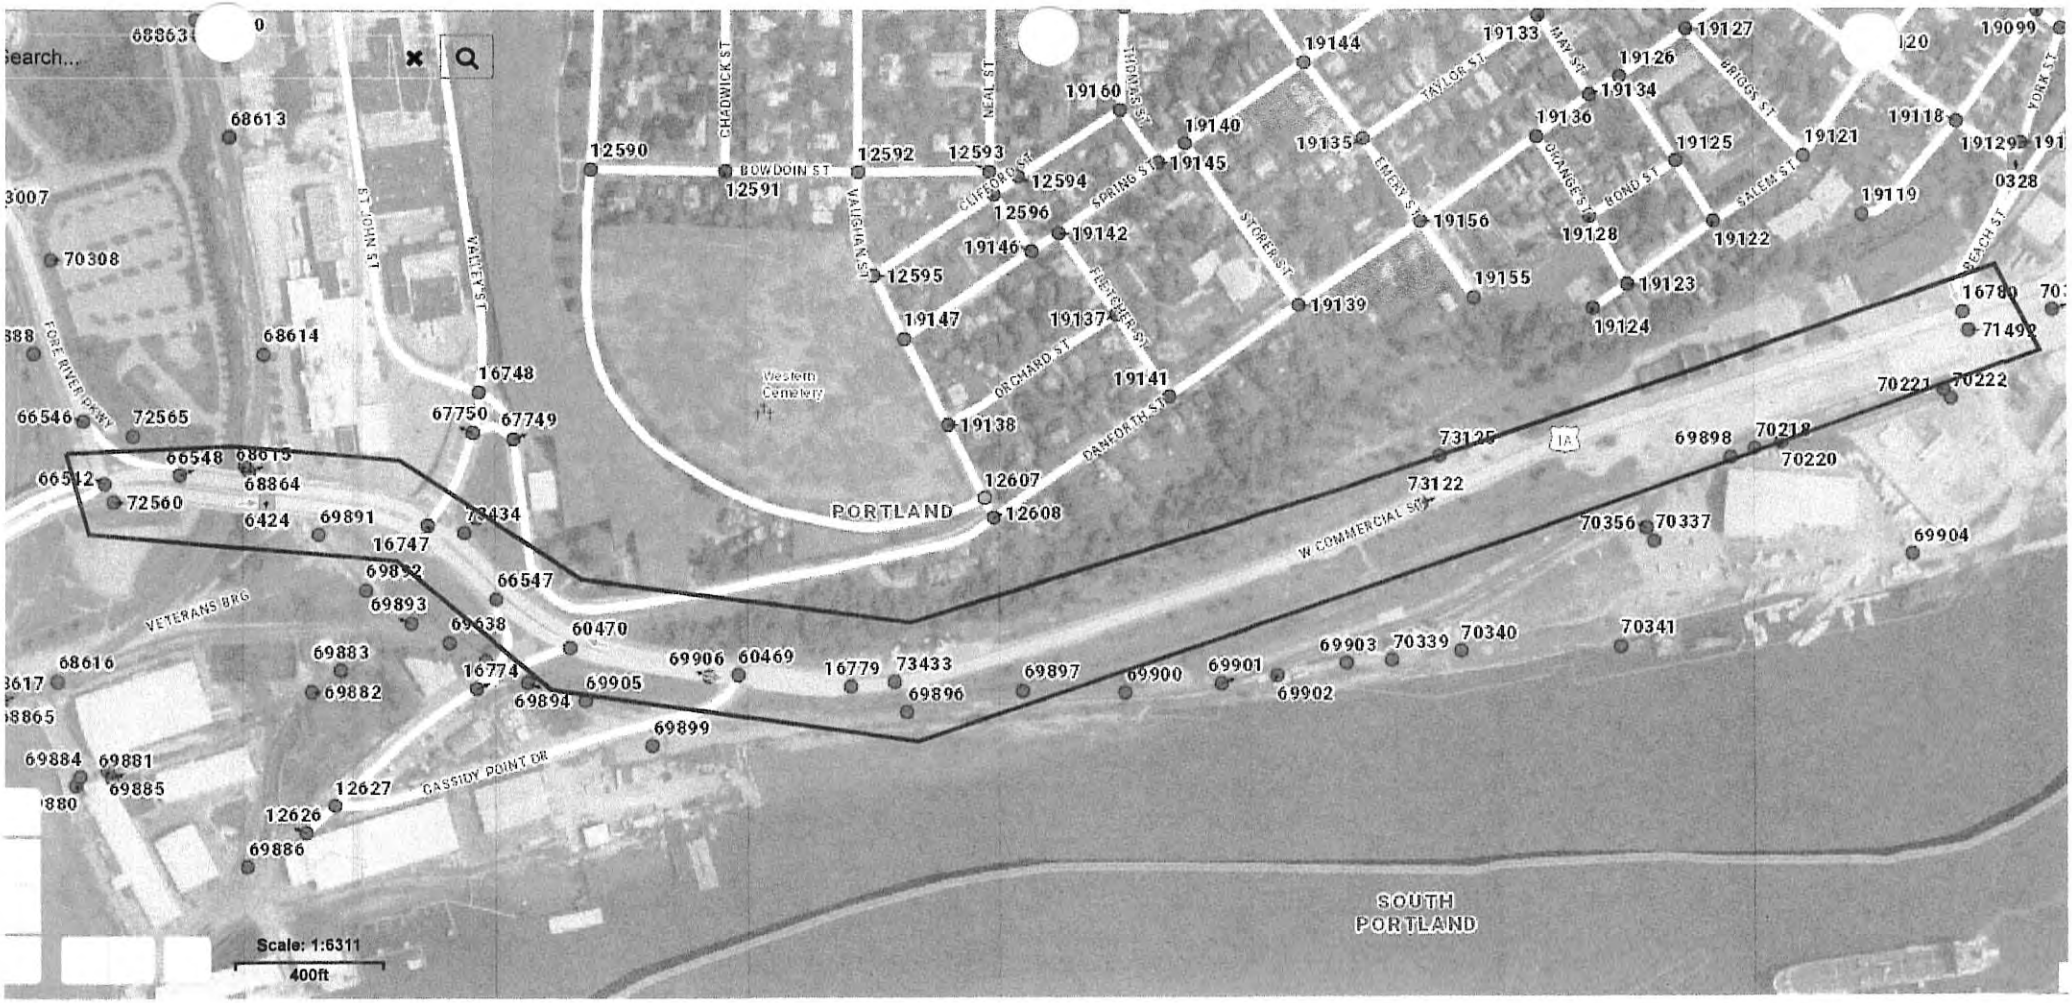
SECTION 2

TRAFFIC ACCIDENTS

MaineDOT's Accident Records Section provided the latest three-year (2016 through 2018) crash data for the section of West Commercial Street between Beach Street and the Fore River Parkway, a distance of 1.40 miles. MaineDOT's report is presented as follows:



2016 -2018 Traffic Accident Summary

Location	Total Crashes	Critical Rate Factor
1. West Commercial Street @ Valley Street	26	0.75
2. West Commercial Street @ Beach Street	30	1.17
3. West Commercial Street @ Cassidy Point Drive	5	0.37
4. West Commercial Street btw. Fore River Parkway and Valley Street	3	0.29
5. West Commercial Street btw. Valley Street and Cassidy Point Drive	1	0.27
6. West Commercial Street near Benny's Diner	2	0.65
7. West Commercial Street btw. gravel turnout and Beach Street	12	0.51

The MaineDOT considers any roadway intersection or segment a high crash location if both of the following criteria are met:

- ***8 or more accidents***
- ***A Critical Rate Factor greater than 1.00***

As the data presented in the table shows, the intersection of West Commercial Street and Beach Street meets both MaineDOT's criteria for identification of a high crash location, with a total of 30 crashes and a corresponding critical rate factor of 1.17. MaineDOT provided a detailed vehicle collision diagram for the intersection that maps the crash patterns of each of the 30 vehicle collisions. That document visually presents two very distinct crash patterns occurring within the intersection; 18 crashes are "rear-end" crashes involving through vehicles on both approaches of West Commercial Street colliding with a second vehicle traveling in the same direction. A second crash pattern were "angle" collisions with a total of four incidences involving a motorist turning left from the eastbound approach of West Commercial Street to Beach Street stuck by a thru vehicle traveling westbound through the intersection.

SECTION 3

A. ENTRANCE/EXIT LOCATION

There will be three primary driveways into the site from West Commercial Street. All three driveways are proposed to be unsignalized. The westerly driveway will provide the primary access for staff/employees to the 150-space surface parking lot. Staff parking is located on the westside of the building to provide convenient access to the proposed building, as staff entry is differentiated from patient/visitor access into the building. The central driveway is the primary patient/visitor access route and it is located between the clinic building and the proposed site garage to allow for ease of patient access to the clinic building, as well as, vehicular movements in/out of the garage. The most easterly driveway is located east of the parking structure and will provide access for entering and exiting movements out of the garage. The driveway also provides for emergency and heavy vehicle movements around the garage and to the rear of the parking structure avoiding conflicts with other site uses through the westerly and central access driveways.

It is expected that each of the three driveways will require dedicated left-turn lanes for entry movements to the site from West Commercial Street. These lanes and the projected volumes of traffic through them are not expected to significantly overlap with left-turn movements into the Canal Landing Boat facility. The Canal Landing site design also provides three points of access onto West Commercial Street with the central and far westerly driveways infrequently used and carrying limited traffic volumes. The most easterly driveway into the boat yard is located approximately 250-feet east of the proposed parking garage. The Canal Landing traffic volumes are very low and are not expected to conflict with traffic generated by the proposed Clinic site. The existing West Commercial Street road section consists of basically two 15' wide travel lanes and approximately 6" paved shoulders on each side for a total of 42', although, in some areas it is wider at 46'. The right of way width is about 70' on the westerly end and up to 80' on the easterly end of the site frontage.

The Applicant seeks the City's direction on design considerations for providing left-turn treatments to each of the three proposed driveway entrances.

SECTION 3

B. ENTRANCE AND EXIT PLAN VIEW

The City of Portland's Technical Standards require the following sight distance standards for a non-mobility roadway:

Sight Distance Standards

Speed Limit	Sight Distance
25 mph	200 feet
30	250
35	305

West Commercial Street is currently posted at 40mph in the vicinity of the proposed Community Based Outpatient Clinic site, which requires an unobstructed sightline of 360-feet. A clear line-of-sight in excess of 500-feet was measured "*looking*" in both directions from each of the three proposed driveway entrances to the site.

C. ENTRANCE/EXIT DESIGN

The proposed project, including all required off-site improvements (if applicable), will be designed and constructed as directed by the City of Portland.

SECTION 4

TITLE, RIGHT OR INTEREST

Attached is a WARRANTY DEED, signed on November 21, 2011 that grants to J.B. Brown & Sons, the described land for the proposed site. The attached Ground lease agreement between J.B. Brown & Sons and FDS JBB Portland, LLC serves as evidence of the RTI for the applicant to the property.

MAINE REAL STATE TAX PAID

RELEASE DEED

MAINE CENTRAL RAILROAD COMPANY, a corporation duly organized and existing under the laws of the State of Maine, with offices at 1700 Iron Horse Park, North Billerica, Middlesex County, Massachusetts (the "Grantor") in consideration of Seven Hundred Ninety Three Thousand and 00/100 ($793,000.00) Dollars paid to it by **J.B. BROWN & SONS,** with a mailing address of 36 Danforth Street, Portland, ME 04101 (the "Grantee") hereby grants to the Grantee all the Grantor's right, title and interest, without any warranties or covenants of title whatsoever, in a certain parcel of land, and the buildings, bridges, structures, crossings, fixtures and improvements thereon, if any, situated in Portland, County of Cumberland, State of Maine (the "Premises") described as follows:

SEE EXHIBIT "A" ATTACHED HERETO AND
MADE A PART HEREOF BY THIS REFERENCE.

This conveyance is subject to the following reservations, conditions, covenants and agreements:

1. This conveyance is made without granting any right of way, either by necessity or otherwise, over any remaining land or location of the Grantor.

2. ~~The Grantor hereby reserves an exclusive, permanent right of way and easement in, on, over, under, across and through the Premises for the purpose of accessing, constructing, installing, operating, maintaining, modifying, repairing, replacing, relocating and removing a telecommunications system or other system for transmission of intelligence or information by any means, whether now existing or hereafter devised, including such poles, pipes, wires, fibers, fiberoptic cables, repeater stations, attachments, appurtenances, structures or other equipment and property of any description necessary or useful for the same (the "Telecommunications Easement"). The Grantor further reserves the right to freely lease, license, mortgage, assign, pledge and otherwise alienate the Telecommunications Easement. The Grantee hereby covenants with the Grantor to recognize the Telecommunications Easement and, without the payment of any further consideration, to execute, acknowledge and deliver such instruments suitable for recording with the registry of deeds as the Grantor may reasonably~~

~~require to acknowledge title to the Telecommunications Easement in the Grantor. The Grantor covenants to reasonably repair and restore the surface of the easement area after any work.~~

3. ~~The Grantor excepts from this conveyance any and all railroad tracks, railroad track materials (including, but not limited to, ties, connections, switches and ballast) and/or related equipment of any description located in whole or in part within the Premises (the "Trackage") and this conveyance is subject to the right of the Grantor to enter the Premises from time to time and at any and all times within the ninety (90) day period commencing with and subsequent to the date of delivery of this deed, with such men, equipment and materials as, in the reasonable opinion of the Principal Engineering Officer of the Grantor, are necessary for the removal of the Trackage. Days during the months of December, January, February and March shall not be included in the aforesaid ninety (90) day period. If the Trackage is not removed from the Premises by the expiration of said ninety (90) day period, the Trackage shall be deemed abandoned by the Grantor and shall then become the property of the Grantee.~~

4. ~~The Grantor excepts from this conveyance any and all advertising signs and/or billboards located upon the Premises which are not owned by the Grantor. Furthermore, this conveyance is subject to the right of the owners of said signs and/or billboards to go upon the Premises and remove them within ninety (90) days from the date of delivery of this deed.~~

5. By the acceptance of this deed and as part consideration therefor, the Grantee hereby assumes any and all agreements, covenants, obligations and liabilities of the Grantor in respect to any underground facilities, drainage culverts, walls, crossings and/or other structures of any nature and description located in whole or in part within the Premises.

6. By the acceptance of this deed and as part consideration therefor, the Grantee agrees to irrevocably waives, gives up and renounces any and all claims or causes of action against the Grantor in respect of claims, suits and/or enforcement actions (including any administrative or judicial proceedings and any remedial, removal or response actions) ever asserted, threatened, instituted or requested by any person and/or governmental agency on account of: (a) any release of oil or hazardous materials or substances of any description on, upon or into the Premises in contravention of any ordinance, law or statute (including, but not limited to, the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (42 U.S.C. Section 9601, et seq., as amended); and (b) any and all damage to real or personal property, natural resources and/or harm or injury to persons alleged to have resulted from such release of oil or hazardous materials or substances.

7. ~~By the acceptance of this deed and as part consideration therefor, the Grantee hereby agrees to build and forever maintain fences (together with any necessary gates), suitable to the Principal Engineering Officer of the Grantor, along the boundaries of the Premises which are common to remaining land or location of the Grantor (the "Fences"), if Fences are ever required in the sole and reasonable opinion of said Principal Engineering Officer.~~

8. ~~This conveyance is subject to the following restriction for the benefit of other land or location of the Grantor, to wit: that from the date of delivery of this deed, the Grantor shall not be liable to the Grantee or any lessee or user of the Premises (or any part thereof) for any damage to any buildings or property upon them caused by fire, whether communicated directly or indirectly by or from locomotive engines of any description upon the railroad operated by the Grantor, or otherwise.~~

9. ~~By the acceptance of this deed and as part consideration therefor, the Grantee hereby agrees to make no use of the Premises which, in the sole and reasonable opinion of the Principal Engineering Officer of the Grantor, adversely affects, increases or decreases drainage to, from, upon or in any remaining land or location of the Grantor. The Grantee agrees to indemnify and save the Grantor harmless from and against any and all loss, cost, damage or expense including, but not limited to, the cost of defending all claims and/or suits for property damage, personal injury or death arising out of or in any way attributable to any breach of the foregoing covenant.~~

10. ~~The Grantor excepts from this conveyance any and all overhead, surface or underground signal and communication line facilities of the Grantor located within the limits of the Premises and this conveyance is subject to the Grantor's use of any such facilities in their present locations and entry upon the Premises from time to time to maintain, repair, replace, renew, relay or remove such facilities.~~

11. The strikeout sections in this Deed are intentionally deleted.

12. Whenever used in this deed, the term "Grantor" shall not only refer to the **MAINE CENTRAL RAILROAD COMPANY**, but also its successors, assigns and affiliates and the term "Grantee" shall not only refer to the above-named Grantee, but also the Grantee's successors, assigns and grantees, as the case may be.

13. The several exceptions, reservations, conditions, covenants and agreements contained in this deed shall be deemed to run with the land and be binding upon the Grantee forever. In addition to the acceptance and recording of this deed, the Grantee hereby signifies assent to the said several exceptions, reservations, conditions, covenants and agreements, by joining in its execution.

IN WITNESS WHEREOF, the said **MAINE CENTRAL RAILROAD COMPANY** has caused this release deed to be executed in its name and its corporate seal to be hereto affixed by David A. Fink, its President, thereunto duly authorized this 21st day of November, 2011.

Exhibit A

A certain lot or parcel of land, with the buildings thereon, situated on the northerly side of West Commercial Street, in the City of Portland, County of Cumberland, and State of Maine, bounded and described as follows:

Beginning at a point on the northerly sideline of West Commercial Street, on the westerly sideline of the former Emery Street now land of J. B. Brown and Sons;

Thence, S 66°06'27" W along the northerly sideline of said West Commercial Street 784.47 feet;

Thence, S 71°39'57" W along the northerly sideline of said West Commercial Street 731.36 feet;

Thence, S 80°52'21" W along the northerly sideline of said West Commercial street 437.92 feet to the West Commercial Street off-ramp;

Thence, along said off-ramp, the following courses and distances:

Northwesterly, along a curve to the right having a radius of 1023.32 feet, a delta of 7°02'02", and whose chord bears N 88°49'29" W, a distance of 125.55 feet, an arc length of 125.63 feet;

N 66°06'38" W a distance of 93.96 feet;

Northwesterly, along a curve to the left, having a radius of 194.00 feet, a delta of 38°27'00", and whose chord bears N 85°20'08" W, a distance of 127.76 feet, an arc length of 130.19 feet;

S 75°26'22" W a distance of 33.57 feet;

Thence; N 81°44'16" W along land now or formerly of the State of Maine 171.41 feet;

Thence, N 08°15'44" E along land of said State of Maine 22.46 feet to the southerly sideline of Danforth Street;

Thence along said Danforth Street the following courses and distances:

N 83°43'02" E a distance of 96.39 feet;

Northeasterly, along a curve to the left, having a radius of 1042.16 feet, a delta of 12°51'52", and whose chord bears N 77°17'06" E, a distance of 233.50 feet, an arc length of 233.99 feet;

N 70°51'10" E a distance of 187.93 feet;

Northeasterly, along a curve to the right, having a radius of 800.00 feet, a delta of 2°21'41", and whose chord bears N 72°02'04" E, a distance of 32.97 feet, an arc length of 32.97 feet to land now or formerly of South Rise Condominiums;

Thence along said South Rise Condominium land the following courses and distances:
S 11°41'22" E a distance of 168.00 feet;
N 81°56'51" E a distance of 271.00 feet;
N 77°01'13" E a distance of 96.62 feet;
N 75°17'24" E a distance of 51.37 feet to land now or formerly of Shaw;

Thence, N 72°46'26" E along land of said Shaw 94.47 feet;

Thence, N 35°07'51" W along land of said Shaw 69.73 feet to the southerly terminus of "K" Street;

Thence, along said "K" Street, along the southerly side of a 40 foot passageway and the terminus of "E" Street the following courses and distances:

N 55°46'28" E a distance of 17.74 feet;
N 55°46'28" E a distance of 58.47 feet;
N 54°19'46" E a distance of 397.81 feet to land now or formerly of the City of Portland;

Thence, S 35°05'23" E along land of said City of Portland 56.55 feet;

Thence, N 69°03'30" E along land of said City of Portland and land now or formerly of Noonan 85.21 feet;

Thence, N 34°36'51" W along land of said Noonan 92.60 feet to land now or formerly of McFarland;

Thence, N 54°37'05" E along land now or formerly of McFarland, Curtis, Dilworth, Moberg, McDonough and Robertson 367.27 feet to land now or formerly of Pollard & Lantos;

Thence, S 35°47'03" E along land of said Pollard & Lantos 119.22 feet;

Thence, N 54°52'09" E along land of said Pollard & Lantos, and land now or formerly of Bessire and Dyro 441.22 feet to the centerline of Emery Street;

Thence, S 35°05'32" E along the centerline of Emery Street, 153.86 feet;

Thence, N 55°14'50" E a distance of 30.00 feet to the easterly sideline of Emery Street;

Thence, S 35°05'32" E along said easterly sideline, 24.61 feet to the intersection of the easterly side of Emery Street at its intersection with the southerly sideline of Salem Street;

Thence, S 55°14'50" W along land now or formerly of J. B. Brown 60.00 feet;

Thence, S 35°05'22" E along land now or formerly of J. B. Brown 172.39 feet to West Commercial Street and the point of beginning, containing 10.65 acres, more or less. Also

conveying all right, title and interest of Maine Central Railroad Company in and to Emery Street lying within and adjacent to the land herein conveyed.

Reference, is made to a survey by Owen Haskell, Inc. dated October 13, 2011 Job # 2010-095P for a further description of the above described premises.

Reference is also made to the premises conveyed in that certain deed from the Portland Terminal Company to the Maine Central Railroad Company dated December 30, 1985 and recorded in the Cumberland County Registry of Deeds in Book 7026, Page 192.

GROUND LEASE AGREEMENT

THIS GROUND LEASE AGREEMENT ("Lease") is made this 27th day of November, 2018, by and between J.B. BROWN & SONS, a Maine corporation of Portland, Cumberland County, Maine (hereinafter referred to as "Landlord"), and FDS JBB PORTLAND, LLC, a Delaware limited liability company having its principal place of business in Arlington, Virginia (hereinafter referred to as "Tenant").

WITNESSETH:

In consideration of the mutual covenants and agreements contained herein and intending to be legally bound hereby, Landlord and Tenant hereby agree with each other as follows:

SECTION 1. Premises: Landlord hereby ground leases, demises and lets to Tenant, and Tenant hereby takes and hires from Landlord, for the term and upon and subject to the terms, conditions, covenants and provisions set forth in this Lease, the following described premises (sometimes hereinafter referred to as the "Premises"):

> All of that certain tract, piece or parcel of land on the westerly side of Commercial Street in the City of Portland, County of Cumberland and State of Maine, being more particularly described in Exhibit A attached hereto,

together with any and all improvements, appurtenances, rights, privileges and easements benefiting, belonging or pertaining to the parcel described in Exhibit A. Landlord is the sole owner of fee simple title to the Premises. Tenant has entered into or intends to enter into a lease ("GSA Lease") with the United States General Services Administration ("GSA") pursuant to which the GSA intends to occupy the building to be constructed by Tenant in accordance with the requirements set forth in the Lease.

SECTION 2. Term: The initial term of this Lease shall commence on the date hereof (hereinafter referred to as the "Effective Date") and shall continue for a period ending at 11:59 p.m. on twentieth (20th) anniversary of the "Rent Commencement Date" (as herein defined), subject to extension pursuant to Section 3 below. The "Rent Commencement Date" shall be the first day of the month after the date on which Tenant's construction of its proposed building to be situated on the Premises is substantially complete and the GSA accepts the space pursuant to the GSA Lease, unless sooner terminated as herein provided.

SECTION 3. Extension Terms: At the expiration of the initial term of this Lease, the initial term shall be automatically extended for three (3) additional successive periods of ten (10) years each, each upon all of the same other terms, covenants and conditions contained in this Lease, but subject to increases in rent as set forth in Section 4 hereof; provided, however, that Tenant may cancel this Lease, effective as of the date of expiration of the initial term or as of the date of expiration of any of the ten (10) year extension periods, by giving written notice in accordance with Section 26 hereof of such cancellation to Landlord at least twelve (12) months prior to the expiration of the initial term, or the expiration of any of the said ten (10) year extension periods,

as the case shall be. The expression "term of this Lease" and expressions of similar tenor shall mean and refer to the initial term as the same shall have been extended in accordance herewith. The expression "lease year" shall mean each successive twelve-month period during the term of this Lease, with the first such "lease year" to begin with the Rent Commencement Date.

SECTION 4. Rent: During the initial term of this Lease, Tenant covenants and agrees to pay to Landlord, at the address set forth in Section 26 with regard to notices or at such other place as Landlord shall by notice to Tenant from time to time direct, without offset or deduction and without previous demand therefor, base rent in the amount of

payable in equal quarterly installments, each of which shall be one-quarter (1/4th) of said annual rent, in advance on each January 1st, April 1st, July 1st and October 1st.

The base rent amount for each option period shall be mutually agreed to between Landlord and Tenant no later than twelve (12) months prior to the expiration of the initial term, or the expiration of the then option period, but in no event shall the annual base rent be less than the base rent paid in the final year of the immediately preceding year.

SECTION 5. Rent to be Net to Landlord: It is the intention of the parties that the base rent paid to Landlord shall be net to Landlord so that this Lease yields to Landlord the base rent specified herein, and that all costs, expenses and obligations of every kind and nature whatsoever relating to the Premises during the term of this Lease shall be paid by Tenant.

SECTION 6. Use and Restrictions: The Premises may be used for any lawful purpose, including without limitation, leasing of the Premises or a portion thereof to the GSA pursuant to the GSA Lease.

SECTION 7. Taxes and Utility Expenses: (a)(1) Tenant shall, during the term of this Lease, as additional rent, pay and discharge punctually, as and when the same shall become due and payable, all taxes, special and general assessments, water rents, rates and charges, sewer rents and other governmental impositions and charges of every kind and nature whatsoever, extraordinary as well as ordinary (hereinafter referred to as "Taxes"), and each and every installment thereof which shall or may during the term of this Lease be charged, levied, laid, assessed, imposed, become due and payable, or a lien upon, or for, or with respect to, the Premises or any part thereof, or any buildings, appurtenances or equipment owned by Tenant thereon or therein or any part thereof, together with all interest and penalties thereon, under or by virtue of all present or future laws, ordinances, requirements, orders, directives, rules or regulations of the federal, state, county and municipal governments and of all other governmental authorities whatsoever (all of which shall also be included in the term "Taxes" as heretofore defined); and all sewer rents and charges for water, steam, gas, heat, hot water, electricity, light and power, and other service or services furnished to the Premises or the occupants thereof during the term of this Lease.

(2) To the extent that the same may be permitted by law, Tenant or its designees shall have the right to apply for the conversion of any assessment for local improvements assessed during the term of this Lease in order to cause the same to be payable in annual installments, and upon such conversion, Tenant shall pay and discharge punctually said

installments as they shall become due and payable during the term of this Lease. Landlord agrees to permit the application for the foregoing conversion to be filed in Landlord's name, if necessary, and shall execute any and all documents requested by Tenant to accomplish the foregoing result.

(3) Tenant shall be deemed to have complied with the covenants of this paragraph (a) if payment of such Taxes shall have been made either within any period allowed by law or by the governmental authority imposing the same during which payment is permitted without penalty or interest or before the same shall become a lien upon the Premises, and Tenant shall produce and exhibit to Landlord evidence of such payment, if Landlord shall demand the same in writing.

(b) All such Taxes, including assessments which have been converted into installments as set forth in the preceding paragraph (a), which shall become payable during each of the calendar or fiscal tax years, as the case may be, in which the term of this Lease commences or terminates, shall be apportioned pro rata between Landlord and Tenant in accordance with the respective portions of such year during which such term shall be in effect.

(c) (1) Tenant or its designee shall have the right to contest or review all such Taxes by legal proceedings, or in such other manner as it may deem suitable (which, if instituted, Tenant or its designees shall conduct promptly at its own cost and expense, and, if necessary, in the name of and with the cooperation of Landlord, and Landlord shall execute all documents reasonably necessary to accomplish the foregoing). Notwithstanding the foregoing, Tenant shall promptly pay all such Taxes if at any time the Premises or any part thereof shall then be immediately subject to forfeiture, or if Landlord shall be subject to any liability arising out of the nonpayment thereof.

(2) The legal proceedings referred to in the preceding subparagraph (1) shall include appropriate certiorari proceedings and appeals from orders therein and appeals from any judgments, decrees, or orders. In the event of any reduction, cancellation or discharge, Tenant shall pay the amount finally levied or assessed against the Premises or adjudicated to be due and payable on any such contested Taxes.

SECTION 8. Improvements. Repairs. Additions and Replacements: (a)(1) Tenant shall have the right to construct upon the Premises such buildings, appurtenant structures, roadways, walkways, parking areas, service areas and other similar and dissimilar improvements as Tenant shall desire, provided, however, that all such buildings, structures and other improvements shall be constructed in a good and workmanlike manner, in compliance with all applicable building and zoning codes and ordinances.

(2) After the Effective Date, Tenant shall submit to the City of Portland, Maine a completed application for site plan review. Thereafter, Tenant shall diligently and in good faith seek to obtain all zoning changes and variances, environmental and land use permits, and all other governmental licenses, permits and approvals that shall be necessary or convenient for the use and operation of the Premises in accordance with the terms of the GSA Lease. All the said zoning variances, environmental and land use permits, and other governmental licenses,

permits (including building permits) and approvals required to be obtained by Tenant for the use and operation of the Premises in accordance with the terms of the GSA Lease are hereinafter referred to as the "Permits."

(3) Landlord shall cooperate with Tenant, at no material out-of-pocket cost to Landlord, in any and all applications, proceedings and appeals relating to the Permits, and shall, at the request of Tenant, execute and deliver any application, instrument, consent, approval or other document as may be reasonably required for purposes of obtaining any of the Permits, provided that no such application, instrument, consent, approval or other document shall operate to require Landlord to incur any costs or expenses or shall operate to impose any restrictions on Landlord that are inconsistent with the rights and obligations of the parties set forth in this Lease. Tenant may prosecute such applications, proceedings and appeals in its own or in Landlord's name and through counsel of its choice, provided that if prosecuted in Landlord's name, Tenant shall use counsel reasonably acceptable to Landlord and shall indemnify, defend and hold harmless Landlord against any claims arising from Tenant's wrongful acts or the negligent or wrongful acts of Tenant's agents, principals, employees or contractors in prosecuting such applications, proceedings or appeals in Landlord's name.

(4) Notwithstanding anything to the contrary herein, if Tenant shall fail to obtain the Permits within thirty six (36) months after the Effective Date, Tenant may cancel and terminate this Lease by giving Landlord notice of such cancellation and termination within thirty six (36) months after the Effective Date, and upon the giving of such notice, this Lease shall thereby be cancelled and terminated and the parties hereto shall have no further rights or obligations hereunder except for those rights and obligations which by the express terms of this Lease survive such termination. For the purposes hereof, Tenant shall be deemed to have "obtained" the Permits only if (i) all necessary Permits have been issued, the Permits contain no conditions or requirements that in the reasonable opinion of Tenant will materially and adversely affect its proposed use of the Premises, the Permits are not subject to any legal challenge or appeal, and all periods within which any such challenge or appeal may be brought shall have expired, or (ii) Tenant shall notify Landlord that it has obtained all necessary Permits.

(5) Tenant shall perform its construction activities in a manner so as to avoid unreasonable interference with any operations of the Landlord within its adjacent or nearby real property and will cause its construction vehicles, equipment and materials to be stored within the area designated on the site plan or, if not so designated, within a staging area mutually acceptable to Landlord and Tenant, and will, upon request by Landlord, erect temporary construction fences or barricades around Tenant's construction area and will keep the remainder of the Landlord's adjacent or nearby real property free of Tenant's construction debris and equipment.

(b) During construction of the improvements on the Premises, Tenant shall maintain in force and effect, at its cost and expense, reasonable amounts of builder's risk insurance covering the improvements, and such other insurance as will protect Landlord, Tenant and their respective designees from claims for damages because of bodily injury, including death, and from claims for damages to property, which may arise out of or in connection with the construction activities at or near the Premises, whether performed by Tenant or by Tenant's contractors or subcontractors or anyone employed by any of them. Tenant shall deposit with

Landlord, prior to commencement of the construction and thereafter within ten (10) days prior to the expiration of the applicable policies, certificates evidencing such insurance coverage.

(c) Tenant alone shall be responsible for maintaining the buildings and improvements at any time erected on the Premises, and Landlord shall not be required to furnish any services or facilities or to make any improvements, repairs or alterations in or to the Premises during the term of this Lease.

(d) Until the expiration or sooner termination of this Lease, title to any building or buildings or improvements situate or erected on the Premises and the building equipment and other items installed thereon and any alteration, change or addition thereto shall remain solely in Tenant, and Tenant alone shall be entitled to deduct all depreciation on Tenant's income tax returns for any such building or buildings, building equipment and/or other items, improvements, additions, changes or alterations.

(e) On the last day or sooner termination of the term of this Lease, Tenant shall quit and surrender to Landlord the Premises, and any buildings and permanent improvements then thereon.

(f) During the term of this Lease, Landlord shall have the right, but not the obligation, to construct such access roadways and walkways between roadways and walkways of the Premises and Landlord's adjacent property as Landlord shall determine in its reasonable discretion.

SECTION 9. Requirements of Public Authority: (a) During the term of this Lease, Tenant shall, at its own cost and expense, promptly observe and comply with all present and future laws, ordinances, requirements, orders, directives, rules and regulations of the federal, state, county, town and city governments and of all other governmental authorities affecting the Premises or appurtenances thereto or any part thereof whether the same are in force at the commencement of the term of this Lease or may in the future be passed, enacted or directed.

(b) Tenant shall have the right to contest, by appropriate legal proceedings diligently conducted in good faith, in the name of Tenant, or Landlord (if legally required), or both (if legally required), without cost or expense to Landlord, the validity or application of any law, ordinance, rule, regulation or requirement of the nature referred to in paragraph (a) of this section and, if by the terms of any such law, ordinance, order, rule, regulation or requirement, compliance therewith may legally be delayed pending the prosecution of any such proceeding, Tenant may delay such compliance therewith until the final determination of such proceeding.

(c) Landlord agrees to execute and deliver any appropriate papers or other instruments which may be necessary or proper to permit Tenant so to contest the validity or application of any such law, ordinance, order, rule, regulation or requirement and to fully cooperate with Tenant in such contest.

SECTION 10. Covenant Against Liens: If, because of any act or omission of Tenant, any mechanic's lien or other lien, charge or order for the payment of money shall be filed against

Landlord or any portion of the Premises, Tenant shall, at its own cost and expense, cause the same to be discharged of record or bonded within thirty (30) days after written notice from Landlord to Tenant of the filing thereof; and Tenant shall indemnify and save harmless Landlord against and from all costs (including reasonable attorneys' fees), liabilities, suits, penalties, claims and demands resulting therefrom.

SECTION 11. Access to Premises: Subject to the terms of the GSA Lease, Landlord shall have the right to enter upon the Premises at all reasonable times upon reasonable prior notice to Tenant to examine the same provided such entry shall not unreasonably interfere with the businesses then being conducted on the Premises.

SECTION 12. Assignment and Subletting: Tenant shall have the right to enter into the GSA Lease and to assign this Lease and/or to sublet all or any part of the Premises at any time, and from time to time, during the term of this Lease, provided that, notwithstanding any such assignment or subletting, Tenant shall remain directly and primarily liable for the performance of its obligations under this Lease, unless the assignee or sublessee expressly agrees in writing with Landlord to assume all such obligations and has a financial creditworthiness that is reasonably acceptable to Landlord. As to any subletting or assignment of this Lease, within thirty (30) days after the execution of any such assignment, Tenant shall deliver to Landlord a copy of the instrument of assignment together with an agreement (which may be a part of the instrument of assignment) whereby the assignee shall assume, as a direct obligation to Landlord, all of the obligations of Tenant under this Lease.

SECTION 13. Signs: Tenant shall obtain the prior written approval of Landlord to install, maintain and replace upon the Premises or any part thereof any signs, which approval shall not be unreasonably withheld, conditioned or delayed. Any such signs shall comply with any applicable requirements of governmental authorities having jurisdiction and Tenant shall obtain any necessary permits for such purposes. As used in this Section 13, the word "sign" shall be construed to include any placard, light or other advertising symbol or object, irrespective of whether the same be temporary or permanent.

SECTION 14. Indemnity: (a) Tenant shall defend, save harmless, protect and indemnify Landlord from and against any and all losses, liabilities, damages, claims, suits, demands, actions, judgments, costs and expenses which shall arise from, grow out of, or be attributable to (i) Tenant's possession, use, occupation or control of the Premises during the term of the Lease, (ii) any injury to, or death of, any person or persons, or damage to any property while on or about the Premises during the term of the Lease, or (iii) any negligence, act or default of Tenant or its agents, servants, employees, guests or contractors. Tenant shall, at its own cost and expense, defend any and all suits or actions (just or unjust) which may be brought against Landlord or in which Landlord may be impleaded with others upon any such above-mentioned matter, except as may result from the acts set forth in paragraph (b) of this Section 14.

(b) Except for its gross negligence or willful misconduct or the gross negligence or willful misconduct of its officers, agents, servants, employees or contractors, Landlord shall not be responsible or liable for any damage or injury to any property, fixtures, buildings or other improvements, or to any person or persons, at any time on the Premises, including any damage

or injury to Tenant or to any of Tenant's officers, agents, servants, employees, contractors, customers or sublessees.

SECTION 15. Insurance: (a) Tenant shall provide at its expense, and keep in force during the term of this Lease, commercial general public liability insurance in a good and solvent insurance company or companies licensed to do business in the State of Maine, selected by Tenant, and reasonably satisfactory to Landlord, in the amount of at least One Million Dollars ($1,000,000.00) per occurrence and Two Million Dollars ($2,000,000.00) general aggregate. Such policy or policies shall include Landlord as an additional assured. Tenant agrees to deliver certificates of such insurance to Landlord at the beginning of the term of this Lease and thereafter not less than ten (10) days prior to the expiration of any such policy. Such insurance shall be noncancellable without ten (10) days' written notice to Landlord.

(b) During the term of this Lease, Tenant shall keep all buildings and improvements erected by Tenant on the Premises at any time insured for the benefit of Landlord and Tenant, as their respective interests may appear, against loss or damage by fire, and those casualties covered by the customary extended coverage endorsements, in a minimum amount necessary to avoid the effect of coinsurance provisions of the applicable policies. All proceeds payable at any time and from time to time by any insurance company under such policies shall be payable to Tenant. Any proceeds paid to Tenant shall be retained by Tenant, and Landlord shall not be entitled to, and shall have no interest in, such proceeds or any part thereof. Landlord shall, at Tenant's cost and expense, cooperate fully with Tenant in order to obtain the largest possible recovery and shall execute any and all consents and other instruments and take all other actions necessary or desirable in order to effectuate the same and to cause such proceeds to be paid as hereinbefore provided and Landlord shall not carry any insurance concurrent in coverage and contributing in the event of loss with any insurance required to be furnished by Tenant hereunder if the effect of such separate insurance would be to reduce the protection or the payment to be made under Tenant's insurance.

(c) Any insurance required to be provided by Tenant pursuant to this Lease may be provided by blanket insurance covering the Premises and other locations of Tenant provided such blanket insurance complies with all of the other requirements of this Lease with respect to the insurance involved.

(d) Each of Landlord and Tenant hereby releases the other and its officers, directors, shareholders, agents and employees, to the extent of any net insurance proceeds received by the releasor, from any and all liability or responsibility (to the other or anyone claiming through or under them by way of subrogation or otherwise) for any loss or damage to property caused by fire or other catastrophe, even if such fire or other catastrophe shall have been caused by the fault or negligence of the other party, or anyone for whom such party may be responsible.

SECTION 16. Destruction: In the event that, at any time during the term of this Lease, any one or more of the buildings on the Premises shall be destroyed or damaged in whole or in part by fire or other cause within the extended coverage of the fire insurance policies carried by Tenant in accordance with this Lease, then, Tenant, at its own cost and expense, shall cause the same to

be repaired, replaced or rebuilt within a period of time which, under all prevailing circumstances, shall be reasonable.

SECTION 17. Eminent Domain: (a) If the whole of the Premises shall be taken for any public or quasi-public use under any statute or by right of eminent domain or by private purchase in lieu thereof, then this Lease shall automatically terminate as of the date that possession has been taken. In the event of a partial taking (or purchase) of the Premises pursuant to which more than fifty percent (50%) of the land area of the Premises is so taken (or so purchased) or if as a result of a taking (or purchase) the Premises is deprived of direct access to the public streets and highways, or are not reasonably usable for Tenant's purposes, then Tenant shall have the right, but not the obligation, to terminate this Lease by giving written notice of such termination to Landlord on or prior to the date which is sixty (60) days after the date of such taking (or purchase), and upon the giving of such notice of termination the term of this Lease shall expire and come to an end on the last day of the calendar month in which such notice shall be given with the same force and effect as if said day had been originally fixed herein as the expiration date of the term of this Lease. In the event the Lease shall terminate or be terminated, the rental shall, if and when necessary, be adjusted to the day of the taking (or purchase) and neither party shall have any further rights or liabilities hereunder.

(b) In the event of a taking (or purchase) resulting in the termination of this Lease pursuant to the provisions of paragraph (a) of this Section 17 the parties hereto agree to cooperate in applying for and in prosecuting any claim for such taking and further agree that the aggregate net award pertaining to the Premises, after deducting all expenses and costs, including reasonable attorneys' fees, incurred in connection therewith, payable to both Landlord and Tenant shall be divided between Landlord and Tenant as follows:

(i) Landlord shall first be paid an amount equal to the fair market value of the land taken from Landlord, considered as a vacant, unencumbered and unrestricted land with available utilities, as of the date of taking (or purchase), together with interest thereon from the date of taking (or purchase) to the date of payment at the rate paid on said award, and if such value shall be officially determined and stated in the condemnation proceedings, then the amount thereof shall control for the purposes hereof; otherwise, the same, unless agreed upon by the parties to this Lease, shall be determined by arbitration;

(ii) Tenant shall then be paid an amount equal to the depreciated value of any leasehold improvements made upon the Premises by Tenant as carried on Tenant's books for financial reporting purposes; and

(iii) any amount then remaining, after the payments to Landlord and Tenant specified in subparts (i) and (ii) hereinabove, shall be paid to Landlord.

(c) (1) In the event of a partial taking (or purchase) not resulting in the termination of this Lease, pursuant to the provisions of paragraph (a) of this Section 17, Tenant shall, at its own cost and expense, make all repairs to the buildings and improvements on the Premises affected by such taking (or purchase) to the extent necessary to restore the same to a

complete architectural unit (to the extent permitted, however, taking into consideration the amount of land remaining after any such taking or purchase); provided, however, that Tenant shall not be obligated to expend an amount in excess of the proceeds of the net award available to Tenant for such purposes, as hereinafter provided.

(2) All compensation available or paid to Landlord and Tenant upon such a partial taking (or purchase) shall be paid to Tenant for the purpose of paying towards the cost of such restoration, or, in the event that the parties hereto agree that only a portion of the aggregate award is sufficient to so restore, then only such portion as agreed upon shall be paid to Tenant for such purpose and the balance shall be distributed pursuant to subparagraph (3) of this paragraph (c) of this Section 17.

(3) All compensation available or paid to Landlord and Tenant upon such a partial taking (or purchase) in excess of the amount thereof needed by Tenant to repair and restore the buildings and improvements shall be distributed in the same manner as is provided in subparts (i) and (ii) of paragraph (b) of this Section 17, except that all compensation for any temporary taking shall be distributed to Tenant without participation by Landlord.

SECTION 18. Utility Easements: Tenant shall have the right to enter into reasonable agreements with utility companies and/or public authorities which provide necessary utilities, creating easements in favor of such companies and/or authorities as are required in order to service the occupants of the buildings on the Premises, and Landlord covenants and agrees to consent thereto and to execute any and all documents, agreements and instruments, and to take all other actions, in order to effectuate the same, all at Tenant's cost and expense.

SECTION 19. Quiet Enjoyment: Tenant, upon paying the rent and additional rent and all other sums and charges to be paid by it as herein provided, and observing and keeping all covenants, warranties, agreements and conditions of this Lease on its part to be kept, shall quietly have and enjoy the Premises and appurtenant rights during the term of this Lease, without hindrance or molestation by any party claiming by, through or under Landlord.

SECTION 20. Tenant's Covenants; Environmental Compliance: (a) In addition and supplementary to any other provisions of this Lease and not in limitation thereof, Tenant covenants and agrees as follows:

(i) to pay when due all rent, additional rent and other charges hereunder, and to observe and perform all other agreements and obligations of Tenant under this Lease at the times and in the manner provided herein;

(ii) to procure any licenses and permits required for any use made of the Premises; and upon the expiration or termination of this Lease, to remove from the Premises all personal property, equipment, goods and effects of Tenant and those of all parties holding under Tenant and to yield up peaceably to Landlord the Premises in working order, repair and condition in all respects, damage by fire or other casualty or by condemnation or taking (provision for all

of which is made elsewhere in this Lease) and reasonable wear and tear only excepted;

(iii) not to make any use of the Premises which is improper, offensive or illegal or which is prohibited by the provisions of this Lease; nor to permit any act or thing to be done on the Premises which shall constitute waste or a nuisance; and

(iv) to furnish Landlord with the name, address and telephone number of Tenant's property manager of the Premises so that Landlord will at all times be able to contact the property manager of the Premises.

(b) Tenant shall not cause or permit the release, discharge, placement or deposit upon the Premises of any Hazardous Materials (as hereinafter defined). In the event any Hazardous Materials shall be released, discharged, placed or deposited upon the Premises during the term of this Lease, Tenant shall (1) conduct and complete all investigations, studies, sampling, and testing and all remedial, removal, reporting and other actions necessary to clean up and remove, or to identify and handle, all Hazardous Materials on, from or affecting the Premises in accordance with all applicable federal, state and local laws, regulations, rules, ordinances and policies, in accordance with the orders and directives of all federal, state and local governmental authorities, and (2) defend, indemnify and hold harmless Landlord, and its employees, agents, officers and directors, from and against any and all claims, demands, penalties, fines, liabilities, settlements, damages, costs or expenses (including, without limitation, reasonable attorney and consultant fees, investigation and laboratory fees, court costs and litigation expenses) of whatever kind or nature, known or unknown, contingent or otherwise, arising out of or in any way related to (i) the presence, disposal, release, or threatened release of any Hazardous Materials which are on, from or affecting the Premises caused by Tenant, its employees, agents, officers or directors; (ii) any personal injury (including wrongful death) or property damage (real or personal) arising out of or related to Hazardous Materials on, from or affecting the Premises caused by Tenant, its employees, agents, officers or directors; (iii) any lawsuit brought or threatened, settlement reached or government order relating to Hazardous Materials on, from or affecting the Premises and caused by Tenant, its employees, agents, officers or directors; and/or (iv) any violation of laws, orders, regulations, requirements, or demands of government authorities, or any policies or requirements of Landlord which are based upon or in any way related to Hazardous Materials on, from or affecting the Premises caused by Tenant, its employees, agents, officers or directors. For purposes of this provision, the term "Hazardous Materials" includes, without limitation, any flammable explosives, radioactive materials, hazardous materials, hazardous waste, hazardous or toxic substances, oil or petroleum products, asbestos or related materials; including as the same are defined in the Comprehensive Environmental Response Compensation and Liability Act of 1980, as amended (42 U.S.C. §§ 9601, et seq.), the Hazardous Materials Transportation Act, as amended (49 U.S.C. §§ 1801, et seq.), the Resource Conservation and Recovery Act, as amended (42 U.S.C. §§ 6901, et seq.), applicable Maine Statutes (including 38 M.R.S.A. §§ 561, et seq., 38 M.R.S.A. §§ 1361 et seq., 38 M.R.S.A. §§ 1301 et seq., and 38 M.R.S.A. §§ 1317, et seq.), and in the regulations adopted and publications promulgated pursuant thereto. Notwithstanding the foregoing, Tenant shall not be responsible or liable to Landlord for any Hazardous Materials to the extent that such

Hazardous Materials were on, from or affecting the Premises prior to the Rent Commencement Date or were generated, stored, handled, transported, disposed of, discharged or released by Landlord or its agents, employees, licensees or contractors, except to the extent exacerbated by any negligence or willful misconduct with respect to the foregoing by Tenant, its agents, employees, licensees or contractors. In addition to the foregoing, Tenant shall provide Landlord with copies of any notices, correspondence, warnings, guidance or other written materials received from any governmental authority or other person or entity in connection with Hazardous Materials on, upon, under, from or into the Premises and shall give Landlord written notice of its discovery or release of any Hazardous Materials on, upon, under, from or into the Premises. The foregoing provisions shall be in addition to any other obligations and liabilities Tenant may have under this Lease, at common law or otherwise, and shall survive the termination of this Lease.

(c) Tenant acknowledges Landlord's concern that the Premises be and remain in compliance with applicable environmental laws, regulations, rules, ordinances and policies and that Landlord has a direct interest in such matters and, therefore, without limiting Tenant's obligations under this Section 20, or otherwise, Tenant agrees that Landlord may, but shall be under no obligation to, undertake some or all of the matters referred to in the foregoing part (b) on behalf of Tenant, upon giving Tenant at least thirty (30) days prior written notice and failure by Tenant to undertake same, and thereupon Tenant shall have no further right to undertake such matters itself, but shall continue to be liable to Landlord pursuant to Tenant's indemnity.

SECTION 21. Defaults; Remedies: (a) In the event Tenant shall fail to pay any installment of rent or additional rent within ten (10) days after receipt of written notice from Landlord to Tenant, or if Tenant shall neglect or fail to perform or observe any of the terms, provisions, conditions and covenants herein contained, and on Tenant's part to be performed, or observed for a period of thirty (30) days after the Landlord shall have given Tenant notice of such neglect or failure, or if a receiver, guardian, conservator, trustee in bankruptcy or similar officer shall be appointed by a court of competent jurisdiction to take charge of all or any part of Tenant's property, which appointment is not stayed or terminated within ninety (90) days, or if Tenant commits any act of bankruptcy, or if a petition is filed by Tenant under any bankruptcy or insolvency law, and the same shall not be dismissed within ninety (90) days from the date upon which it is filed, and provided Tenant shall not cure said failure as provided in paragraph (b) of this Section 21; then, Landlord may, at its option, give to Tenant a notice of election to end the term of this Lease upon a date specified in such notice, which date shall be not less than sixty (60) days after the date of receipt by Tenant of such notice from Landlord, and upon the date specified in said notice, the term and estate hereby vested in Tenant shall cease and any and all other right, title and interest of Tenant hereunder shall likewise cease without further notice or lapse of time, as fully and with like effect as if the entire term of this Lease had elapsed.

(b) In the event that Landlord gives notice of a default of such a nature that it cannot be cured within such thirty (30) day period, then such default shall not be deemed to continue so long as Tenant, after receiving such notice, proceeds to cure the default as soon as reasonably possible and continues to take all steps necessary to complete the same within a period of time which, under all prevailing circumstances, shall be reasonable. No default shall be deemed to

continue if and so long as Tenant shall be so proceeding to cure the same in good faith or be delayed in or prevented from curing the same by any of the causes specified in Section 25 hereof.

(c) Upon any termination of the term of this Lease pursuant to paragraph (a) of this Section 21, or at any time thereafter, Landlord may, in addition to and without prejudice to any other rights and remedies Landlord shall have at law or in equity, reenter the Premises, and recover possession thereof and dispossess any or all occupants of the Premises in the manner prescribed by the statute relating to summary proceedings, or similar statutes.

(d) No such expiration or termination of this Lease, or summary proceedings, reentry or dispossess, shall relieve Tenant of its liability and obligation under this Lease, whether or not the Premises shall be relet, and Tenant covenants and agrees, in the event of any such expiration or termination of this Lease, or summary proceedings, reentry or dispossess, to pay to Landlord, upon demand, in a single lump sum, the total of (1) all minimum rent, additional rent and other charges due and unpaid as of the date of such expiration or termination, (2) all reasonable costs and expenses incurred by Landlord in connection with its termination of this Lease and/or recovery of possession of the Premises, and (3) either (x) as liquidated damages a sum equal to the discounted value (using as a discount rate the Prime Rate as quoted by The Wall Street Journal or its successor on the date of such payment) of the amount, if any, by which the rent reserved hereunder for the remainder of the term of this Lease shall exceed the fair rental value of the Premises for the remainder of the term of this Lease, discounted to the date of payment, or (y) amounts equal to the several installments of rent and other charges reserved as would, under the terms of this Lease, on the days originally fixed herein for the payment thereof, become due and payable if this Lease had not so expired or been terminated, or if Landlord had not entered or reentered as aforesaid, and whether the Premises be relet or remain vacant in whole or in part or for a period less than the remainder of the term, and for the whole thereof, up to but not exceeding the amount of any deficiency then existing after giving due credit for any net proceeds of any reletting after deducting all of Landlord's reasonable expenses in connection with such reletting, including reasonable brokers' and attorneys' fees and the reasonable costs of recovering possession of and refitting the Premises; and any suit brought to collect the amount of the deficiency for any month or other period shall not prejudice in any way the rights of Landlord to collect the amount of the deficiency for any subsequent month or other period by similar proceeding. Landlord shall use reasonable efforts to relet the Premises after any such expiration or termination of this Lease.

(e) If Tenant shall become a debtor under the United States Bankruptcy Code, 11 U.S.C. §§ 101 et seq. (the "Bankruptcy Code") then, to the extent that the Bankruptcy Code may be applicable or affect the provisions of this Lease, the following provisions shall also be applicable. If the trustee or debtor-in-possession shall fail to elect to assume this Lease within sixty (60) days after the commencement of a case under the Bankruptcy Code, this Lease shall be deemed to have been rejected; and the Landlord shall be thereafter immediately entitled to possession of the Premises and this Lease shall be terminated subject to and in accordance with the provisions of this Lease and of law (including such provisions for damages). No election to assume (and, if applicable to assign) this Lease by the trustee or debtor-in-possession shall be permitted or effective unless (i) all defaults shall have been cured and Landlord shall have been provided with adequate assurances reasonably satisfactory to Landlord, including (1) any

reasonably required guaranties and/or security deposits, and (2) any other reasonably required assurances that there will continue to be sufficient funds to professionally operate the Premises in strict compliance with all provisions of this Lease; and (ii) neither such assumption nor the operation of the Premises subsequent thereto shall, in Landlord's reasonable judgment, cause or result in any breach or other violation of any provision of this or any applicable lease, mortgage or other contract; and (iii) the assumption and, if applicable, the assignment of this Lease satisfies in full the provisions of the Bankruptcy Code, including, without limitation, Sections 365(b)(1) and (3) and (f)(2); and (iv) the assumption has been ratified and approved by order of such court or courts as have final jurisdiction over the Bankruptcy Code and the case. No assignment of this Lease by the trustee or debtor-in-possession shall be permitted or effective unless the proposed assignee likewise shall have satisfied (i), (ii), (iii) and (iv) of the preceding sentence regarding such assignment. When pursuant to the Bankruptcy Code the trustee or debtor-in-possession is obligated to pay reasonable use and occupancy charges, such charges shall not be less than the rent and other charges specified herein to be payable by Tenant. Neither Tenant's interest or estate in the Premises herein or created hereby nor any lesser interest or estate of Tenant shall pass to anyone under any law of any state or jurisdiction without the prior written consent of Landlord. In no event shall this Lease, if the term hereof has expired or has been terminated in accordance with the provisions of this Lease, be revived, and no stay or other proceedings shall nullify, postpone or otherwise affect the expiration or earlier termination of the term of this Lease pursuant to the provisions of this Section 21, or prevent Landlord from regaining possession of the Premises thereupon.

SECTION 22. Arbitration: (a) In any case in which this Lease provides that a dispute shall be determined by arbitration, the arbitration shall be facilitated through the services of JAMS and conducted in accordance with the following paragraphs.

(b) A party initiating arbitration proceedings may do so by giving notice to that effect to the other party. The notice shall designate a disinterested person as one of the arbitrators. The body which initiates arbitration is hereinafter referred to as the "first party". The other party is hereinafter referred to as the "second party". Within fifteen (15) days after the initiation of the arbitration proceedings, the second party shall give notice to the first party designating another disinterested person as an arbitrator. Within the next twenty (20) days, the two arbitrators shall select a third disinterested person as a third arbitrator. The three arbitrators shall judge the dispute. If the second party shall fail to appoint a second arbitrator within the fifteen (15) day period next following the notice initiating the arbitration, the arbitrator designated by the first party shall judge the dispute and the judgment of the first arbitrator shall be binding upon the parties.

(c) If the two arbitrators appointed by the parties shall be unable to agree upon the appointment of a third arbitrator within the twenty (20) day period after the second arbitrator is designated, the two arbitrators shall give written notice of the failure to agree to each of the parties. If the parties shall fail to agree upon the selection of a third arbitrator within fifteen (15) days after that notice has been received, then within thirty (30) days thereafter either party may apply for the appointment of a third arbitrator to the presiding justice of the existing session of the Cumberland County Superior Court.

(d) The determination of the majority of the arbitrators shall be conclusive upon the parties. The arbitrators shall be directed to interpret and apply the terms of this Lease. Judgment may be entered upon the award of the arbitrators by either party in the Cumberland County Superior Court.

(e) The obligation of Landlord and Tenant to submit a dispute to arbitration is limited to disputes arising under those Sections of this Lease which specifically provide for arbitration. Each party to the arbitration shall pay one-half (½) of the cost thereof.

SECTION 23. Waivers: The failure of Landlord or Tenant to complain of any act or omission on the part of the other party no matter how long the same may continue, shall not be deemed to be a waiver by said party of any of its rights hereunder. No waiver by Landlord or Tenant at any time, express or implied, of any breach of any provision of this Lease shall be deemed a waiver of a breach of any other provision of this Lease or a consent to any subsequent breach of the same or any other provision. No acceptance by Landlord of any partial payment shall constitute an accord or satisfaction but shall only be deemed a part payment on account.

SECTION 24. Zoning and Building Codes: Landlord covenants and agrees to cooperate fully with Tenant in any and all applications and proceedings and appeals made or prosecuted by Tenant in connection with obtaining any necessary approvals or consents under the zoning, land use and/or building regulations, ordinances, codes, laws and directives of all of the federal, state, town and other authorities having jurisdiction over the development and use of the Premises, including, without limitation, the Portland Planning Board and the State Board of Environmental Protection. Landlord shall execute any and all documents, instruments, consents and authorizations requested by Tenant which shall be necessary or desirable with respect thereto. Tenant may prosecute such applications, proceedings and appeals in its own name or in Landlord's name and through counsel of its choice, but shall do so at its own cost and expense.

SECTION 25. Force Majeure: In the event that Landlord or Tenant shall be delayed, hindered in or prevented from the performance of any act (except for the payment of rent) required hereunder by reason of strikes, lock-outs, labor troubles, inability to procure materials, failure of power, restrictive governmental laws or regulations, riots, insurrection, the act, failure to act or default of the other party, war or other reason beyond their control, then performance of such act shall be excused for the period of the delay, and the period for the performance of any such act shall be extended for a period equivalent to the period of such delay.

SECTION 26. Notices: Every notice, approval, consent or other communication authorized or required by this Lease shall not be effective unless the same shall be in writing and sent postage prepaid by United States registered or certified mail, return receipt requested, directed to the other party at its address set forth hereinbelow, or such other address as either party may designate by notice given from time to time in accordance with this Section 26. The rent payable by Tenant hereunder shall be paid to Landlord at the same place where a notice to Landlord is herein required to be directed. All such notices and other communications initially shall be addressed to Landlord at 10 Free Street, Suite 100, Portland, Maine 04101; and to the Tenant at 1001 N. 19th Street, Suite 1401, Arlington, Virginia 22209.

SECTION 27. Certificates: Either party shall, without charge, at any time and from time to time hereafter, within fifteen (15) days after written request of the other, certify by written instrument duly executed and acknowledged to any mortgagee or purchaser, or proposed mortgagee or proposed purchaser, or any other person, firm or corporation specified in such request: (a) as to whether this Lease has been supplemented or amended, and if so, the substance and manner of such supplement or amendment; (b) as to the validity and force and effect of this Lease, in accordance with its tenor as then constituted; (c) as to the existence of any default thereunder; (d) as to the existence of any offsets, counterclaims or defenses thereto on the part of such other party; (e) as to the commencement and expiration dates of the term of this Lease; and (f) as to any other matters as may reasonably be so requested. Any such certificate may be relied upon by the party requesting it and any other person, firm or corporation to whom the same may be exhibited or delivered, and the contents of such certificate shall be binding on the party executing same.

SECTION 28. Leasehold Mortgages: Tenant and every successor and assign of Tenant is hereby given the right by Landlord in addition to any other rights herein granted, without Landlord's prior written consent, to mortgage its leasehold interest in this Lease, or any part or parts thereof, under one or more leasehold mortgages, and to assign this Lease, or any part or parts thereof, and any subleases as collateral security for such leasehold mortgage(s), upon the condition that all rights acquired under such leasehold mortgage(s) shall be subject to each and all of the covenants, conditions and restrictions set forth in this Lease, and to all rights and interests of Landlord herein, none of which covenants, conditions or restrictions is or shall be waived by Landlord by reason of the right given so to grant leasehold mortgages with respect to such interest in this Lease, except as expressly provided herein. The term "leasehold mortgage(s)" as used in this Section 28 and other provisions of this Lease shall include leasehold mortgages, leasehold deeds of trust, collateral or conditional assignments of Tenant's interest in this Lease and like instruments and all modifications, extensions, renewals and replacements thereto. No leasehold mortgage given by Tenant under the provisions of this Section shall be deemed to be an assignment of this Lease so as to require the assumption of said obligations and liabilities by the holder(s) of such mortgage. If Tenant and/or Tenant's successors and assigns shall grant a leasehold mortgage with respect to this leasehold or any part or parts thereof, and if the holder(s) of such leasehold mortgage(s) shall send to Landlord written notice of such leasehold mortgage(s) specifying the name and address of the leasehold mortgagee(s), Landlord agrees that so long as any such leasehold mortgage(s) shall remain unsatisfied of record or until written notice of satisfaction is given by the holder(s) to Landlord, the following provisions shall apply:

(a) There shall be no cancellation, surrender or modification of this Lease by joint action of Landlord and Tenant without the prior consent in writing of the leasehold mortgagee(s).

(b) Landlord shall, upon serving Tenant with any notice of default, also serve a copy of such notice upon the holder(s) of such leasehold mortgage(s), and no such notice of default to Tenant shall be effective unless and until a copy of such notice is served upon each such holder. The leasehold mortgagee(s) shall thereupon have the same period, after service of such notice upon it, to remedy or cause to be remedied the defaults complained of, and Landlord shall accept

such performance by or at the instigation of such leasehold mortgagee(s) as if the same had been done by Tenant.

(c) Anything herein contained notwithstanding, while such leasehold mortgage(s) remains unsatisfied of record, or until written notice of satisfaction is given by the holder(s) to Landlord, if any default shall occur which, pursuant to any provision of this Lease, entitles Landlord to terminate this Lease, and if before the expiration of thirty (30) days from the date of service of notice of termination upon such leasehold mortgagee(s) such leasehold mortgagee(s) shall have notified Landlord of its desire to nullify such notice and shall have paid to Landlord all rent and additional rent and other payments herein provided for, and then in default, and shall have complied or shall commence the work of complying with all of the other requirements of this Lease, if any are then in default, and shall prosecute the same to completion with reasonable diligence, then in such event Landlord shall not be entitled to terminate this Lease and any notice of termination theretofore given shall be void and of no effect.

(d) If Landlord shall elect to terminate this Lease by reason of any default of Tenant, the leasehold mortgagee(s) shall not only have the right to nullify any notice of termination by curing such default, as aforesaid, but shall also have the right to postpone and extend the specified date for the termination of this Lease as fixed by Landlord in its notice of termination, for a period of not more than six (6) months, provided that such leasehold mortgagee(s) shall cure or cause to be cured any then existing money defaults and meanwhile pay the rent, additional rent and comply with and perform all of the other terms, conditions and provisions of this Lease on Tenant's part to be complied with and performed, other than past non-monetary defaults, and provided further, that the leasehold mortgagee(s) shall forthwith take steps to acquire or sell Tenant's interest in this Lease by foreclosure of the mortgage(s) or otherwise and shall prosecute the same to completion with all due diligence. If at the end of said six (6) month period the leasehold mortgagee(s) shall be actively engaged in steps to acquire or sell Tenant's interest herein, the time of said leasehold mortgagee to comply with the provisions of this Section shall be extended for such period as shall be reasonably necessary to complete such steps with reasonable diligence and continuity.

(e) Landlord agrees that in the event of termination of this Lease for any reason, Landlord will at the election of the leasehold mortgagee enter into a new lease of the Premises with the leasehold mortgagee(s) or its nominee(s), for the remainder of the term, effective as of the date of such termination, at the rent and additional rent and upon the terms, provisions, covenants and agreements as herein contained and subject only to the same conditions of title as this Lease is subject to on the date of the execution hereof, and to the rights, if any, of the parties then in possession of any part of the Premises, provided:

(i) Said leasehold mortgagee(s) or its nominee(s) shall make written request upon Landlord for such new lease within thirty (30) days after the date of such termination and such written request is accompanied by payment to Landlord of sums then due to Landlord under this Lease.

(ii) Said leasehold mortgagee(s) or its nominee(s) shall pay to Landlord at the time of the execution and delivery of said new lease, any and all

sums which would at the time of the execution and delivery thereof be due pursuant to this Lease but for such termination, and in addition thereto, any expenses, including reasonable attorneys' fees, to which Landlord shall have been subjected by reason of such default.

(iii) Said leasehold mortgagee(s) or its nominee(s) shall perform and observe all covenants herein contained on Tenant's part to be performed and shall further remedy any other conditions which Tenant under this Lease was obligated to perform under the terms of this Lease.

(iv) Landlord shall not warrant possession of the Premises to Tenant under the new lease.

(v) Such new lease shall be expressly made subject to the rights, if any, of Tenant under this Lease.

(vi) Tenant under such new lease shall have the same right, title and interest in and to the buildings and improvements on the Premises as Tenant had under this Lease.

(f) Any leasehold mortgage holder or any person acquiring the leasehold estate pursuant to a foreclosure of the leasehold mortgage or a deed or assignment in lieu of such foreclosure may, upon such acquisition, without further consent of the Landlord, sell and assign the leasehold estate on such terms and conditions as it may determine and thereafter be relieved of all obligations under this Lease accruing from and after the date of such sale and assignment.

(g) Landlord agrees promptly after submission to execute, acknowledge and deliver any agreements modifying this Lease reasonably requested by any leasehold mortgagee(s), provided that such modification does not decrease Tenant's obligations or decrease Landlord's rights pursuant to this Lease.

(h) The leasehold mortgagee(s) shall be given notice of any arbitration proceedings by the parties hereto and shall have the right to intervene therein and be made a party to such proceedings, and the parties hereto do hereby consent to such intervention. In the event that the leasehold mortgagee(s) shall not elect to intervene or become a party to such proceedings, the leasehold mortgagee(s) shall receive notice of and a copy of any award or decision made in said arbitration proceedings.

(i) The proceeds from any insurance policies or arising from a condemnation are to be held by any leasehold mortgagee(s) and used pursuant to the provisions of this Lease, but the leasehold mortgagee(s) may reserve its rights to apply to the mortgage debt all, or any part, of Tenant's share of such proceeds pursuant to such leasehold mortgage(s).

(j) There shall be no merger of this Lease, nor of the leasehold estate created hereby, with the fee estate in the Premises, by reason of the fact that this Lease, or the leasehold estate created hereby, or any interest in either thereof, may be held directly or indirectly by or for the

account of any person who shall own the fee estate in the Premises or any portion therein, and no such merger shall occur unless and until all persons at the time having any interest in the fee estate and all persons having any interest in this Lease or the leasehold estate, including the leasehold mortgagee(s), shall join in a written instrument effecting such merger.

(k) Landlord shall upon request execute, acknowledge and deliver to each leasehold mortgagee(s) an agreement prepared at the sole cost and expense of Tenant in form satisfactory to such leasehold mortgagee(s) between Landlord, Tenant and the leasehold mortgagee(s), agreeing to all of the provisions of this Section 28.

SECTION 29.: Omitted.

SECTION 30. Acceptance of Premises: Tenant agrees to accept the Premises "as is", without any representation or warranty by Landlord as to the use or condition thereof.

SECTION 31. Attorneys' Fees: Landlord shall be entitled to recover from Tenant all costs and expenses (including reasonable attorneys' fees) reasonably incurred by Landlord in enforcing the provisions of this Lease and/or in repossessing the Premises upon termination of this Lease in accordance with Section 21 hereof. The provisions of this Section 31 shall survive the termination of this Lease.

SECTION 32. Governing Law: This Lease and the performance thereof shall be governed, interpreted, construed and regulated by the laws of the State of Maine.

SECTION 33. Partial Invalidity: If any term, covenant, condition or provision of this Lease or the application thereof to any person or circumstance shall, at any time or to any extent, be invalid or unenforceable, the remainder of this Lease, or the application of such term or provision to persons or circumstances other than those as to which it is held invalid or unenforceable, shall not be affected thereby, and each term, covenant, condition and provision of this Lease shall be valid and enforceable to the fullest extent permitted by law.

SECTION 34. Short Form Lease: The parties will, at any time, at the request of either one, promptly execute duplicate originals of an instrument, in recordable form, which will constitute a short form of lease, setting forth a description of the Premises, the term of this Lease and any other portions thereof, excepting the rental provisions, as either party may request.

SECTION 35. Interpretation: Wherever herein the singular number is used, the same shall include the plural, and the masculine gender shall include the feminine and neuter genders, and vice versa, as the context shall require. The section headings used herein are for reference and convenience only, and shall not enter into the interpretation hereof. This Lease may be executed in several counterparts, each of which shall be an original, but all of which shall constitute one and the same instrument.

SECTION 36. Entire Agreement: No oral statements or prior written matter shall have any force or effect. Tenant agrees that it is not relying on any representations or agreements other

than those contained in this Lease. This Lease shall not be modified or cancelled except by writing subscribed by both parties.

SECTION 37. Parties: Except as herein otherwise expressly provided, the covenants, conditions and agreements contained in this Lease shall bind and inure to the benefit of Landlord and Tenant and their respective successors, personal representatives, administrators and assigns.

SECTION 38. Limitation of Landlord's Liability: It is understood and agreed that, except for matters resulting from the intentional misrepresentations, willful acts, or gross negligence of Landlord, Tenant shall look solely to the estate and property of Landlord subject to this Lease for the satisfaction of Tenant's remedies for the collection of a judgment (or other judicial process) requiring the payment of money by Landlord in the event of any default or breach by Landlord with respect to any of the terms, covenants and conditions of this Lease to be observed or performed by Landlord, and any other obligations of Landlord created by or under this Lease, and no other property or assets of Landlord or of its officers, directors, or members (as the case may be) shall be subject to levy, execution or other enforcement procedures for the satisfaction of Tenant's remedies except as aforesaid.

SECTION 39. Holding Over: In the event that Tenant shall continue in occupancy of the Premises after the expiration of the term hereof, such occupancy shall not be deemed to extend or renew the terms of this Lease, but such occupancy shall continue as a tenancy at will from month to month upon the covenants, provisions and conditions herein contained at a rent equal to 1.25 times the rent in effect during the last lease year of the term, prorated and payable for the period of such occupancy. This Section shall not be construed as giving Tenant any right to hold over after the expiration of the term hereof except as is otherwise expressly provided in this Lease.

SECTION 40. No Broker: Landlord and Tenant agree that no brokers have been involved in this transaction, and each agrees to hold and indemnify the other harmless from and against any losses, damages, costs or expenses (including reasonable attorneys' fee) that either party may suffer as a result of claims made or suits brought by any other broker in connection with this transaction, the obligated party hereunder to be the party whose conduct gives rise to such claim. The provisions of this Section 40 shall survive any termination of this Lease.

EXHIBIT A

A certain lot or parcel of land situated on the westerly side of Commercial Street in the City of Portland, County of Cumberland and State of Maine, and being more particularly bounded and described as follows:

Attached

Proposed Description
Lot A
113 West Commercial Street
Portland, ME
November 12, 2019

A certain lot or parcel of land located on the northerly side of West Commercial Street in the City of Portland, County of Cumberland, State of Maine, bounded and described as follows:

Beginning at a capped iron rod (PLS 2518) located at the intersection with the southwesterly sideline of Emery Street and the northwesterly sideline of West Commercial Street. Thence:

1) S 66°07'19" W by said West Commercial Street a distance of Seven Hundred Eighty-Seven and 39/100 (787.39) feet to a point;

2) S 71°41'30" W by said West Commercial Street a distance of Six Hundred Seven and 20/100 (607.20) feet to a capped iron to be set;

3) N 18°18'30" W through land of the Grantor a distance of Fifty-Six and 55/100 (56.55) feet to a point at the centerline of a formerly contemplated street known as "K" Street and the southeasterly corner of land now or formerly of Marjorie R. Shaw as described in a deed recorded in the Cumberland County Registry of Deeds in Book 9747, Page 339;

4) N 35°07'13" W by said land of Shaw and the said centerline of "K" Street a distance of Sixty-Seven and 16/100 (67.16) feet to a capped iron rod (PLS 2518) located at the southerly sideline of a Forty (40) foot wide passageway;

5) N 54°52'47" E by said passageway a distance of Four Hundred Seventy-Nine and 00/100 (479.00) feet to a capped iron rod (PLS 2518) located at the centerline of a formerly contemplated street known as "E" Street;

6) S 35°07'13" E by said centerline of "E" Street a distance of One Hundred and 00/100 (100.00) feet to a capped iron rod (PLS 2518);

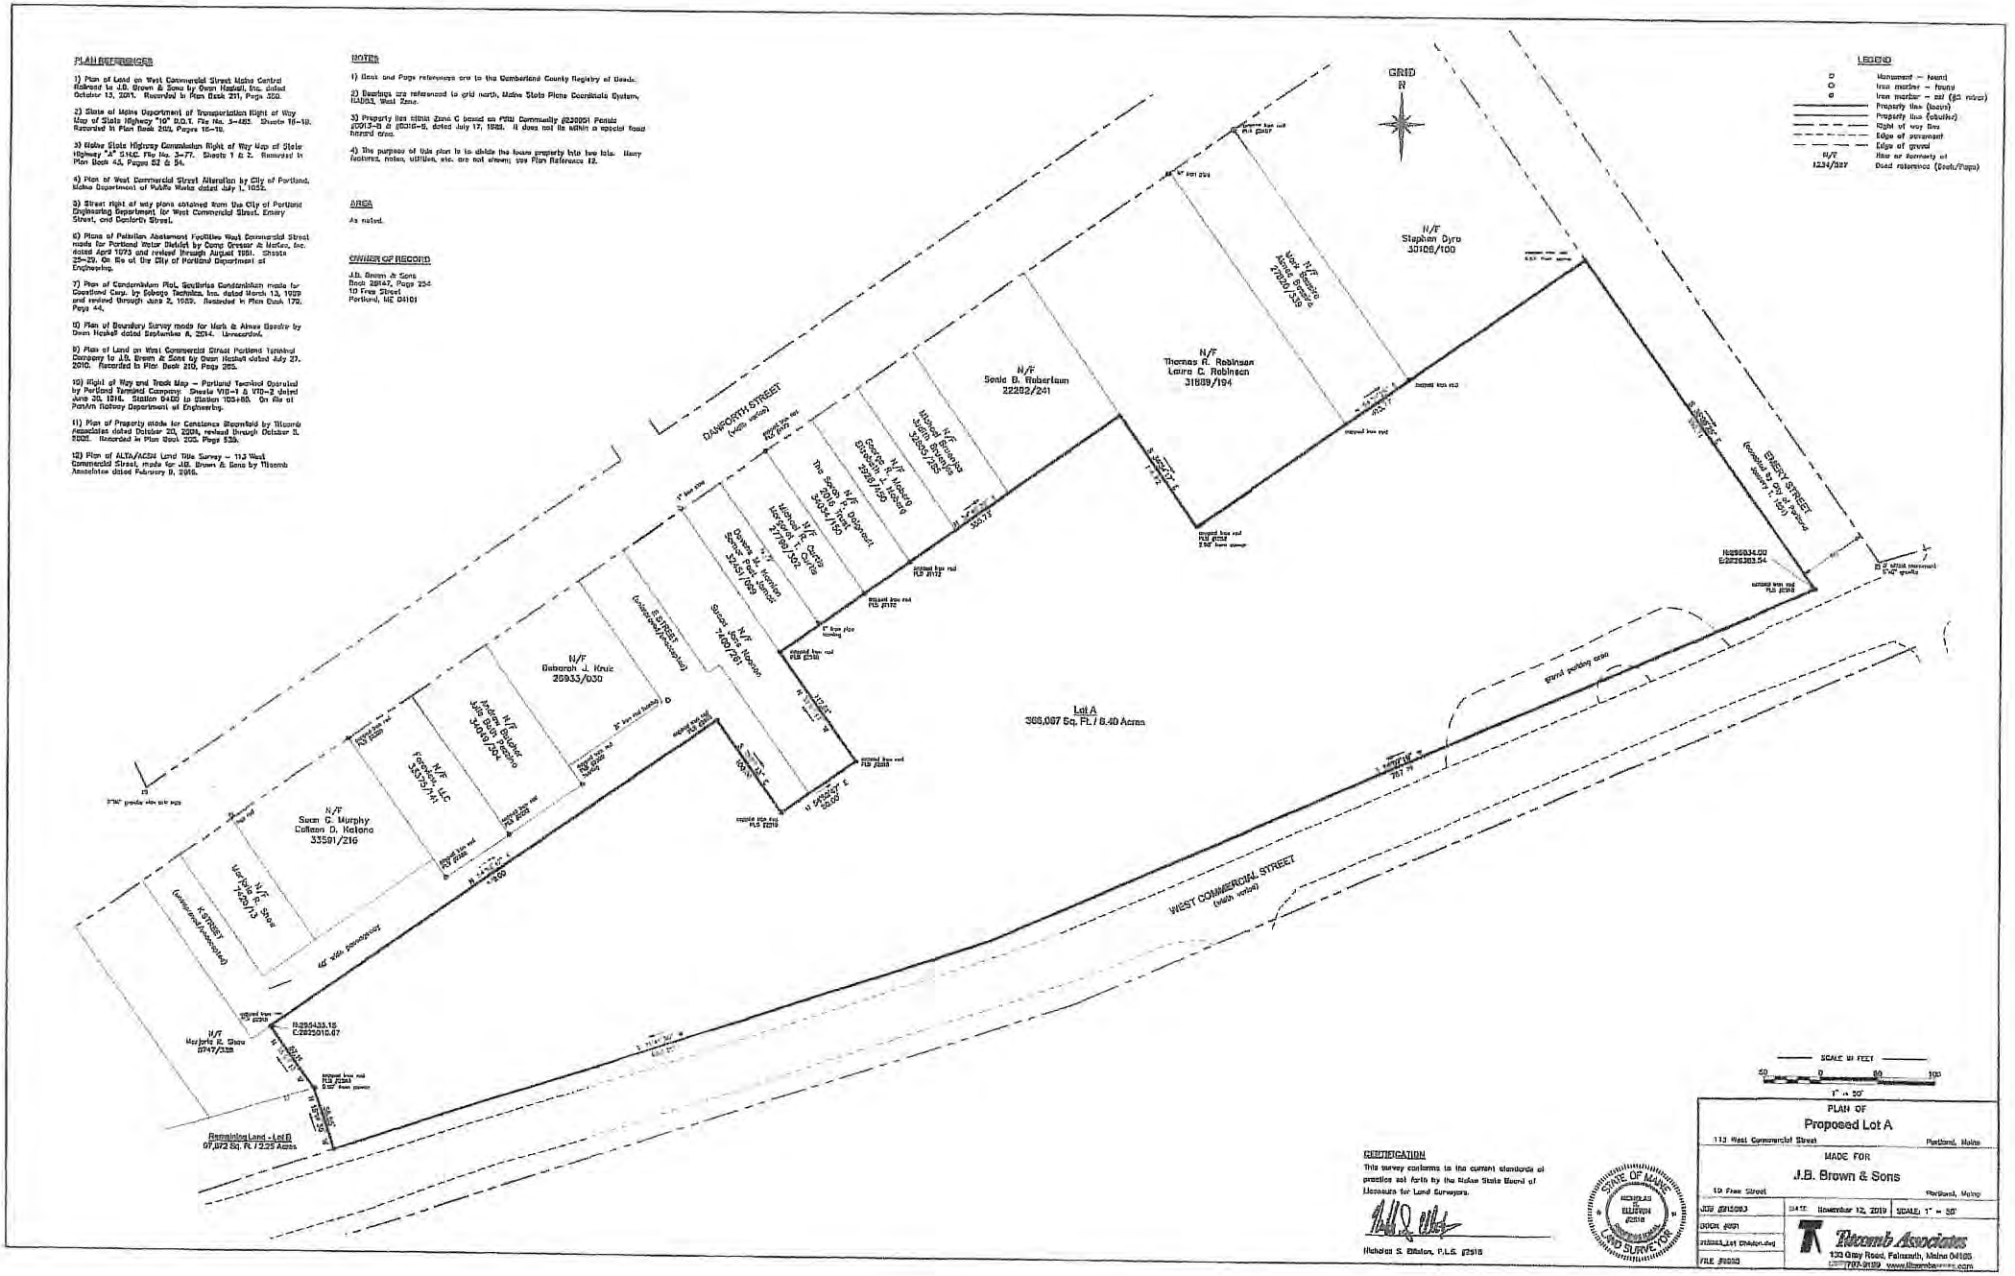
7) N 54°52'47" E by said "E" Street and land now or formerly of Susan Jane Noonan as described in a deed recorded in said Registry in Book 7400, Page 261 a distance of Eighty and 00/100 (80.00) feet to a capped iron rod (PLS 2518);

8) N 35°07'13" W by said land of Noonan a distance of One Hundred Seventeen and 61/100 (117.61) feet to a capped iron rod (PLS 2518) located at the southerly corner of land now or formerly of Devens M. Hamlen and Samar Post Jamali as described in a deed recorded in said Registry in Book 32451, Page 99;

9) N 54°40'20" E by said land of Hamlen and Jamali, land now or formerly of Michael R. Curtis and Margaret T. Curtis as described in a deed recorded in said Registry in Book 27799, Page 302, land now or formerly of Sarah P. Daignault 2016 Trust as described in a deed recorded in said Registry in Book 34034, Page 150, land now or formerly of George R. Moberg and Elizabeth J. Moberg as described in a deed recorded in said Registry in Book 2928, Page 450, land now or formerly of Michael Bruenjes and Judith

Bruenjes as described in a deed recorded in said Registry in Book 32805, Page 285, and land now or formerly of Sonia B. Robertson as described in a deed recorded in said Registry in Book 22292, Page 241 a distance of Three Hundred Sixty-Five and 73/100 (365.73) feet to a point at land now or formerly of Thomas R. Robinson and Laura C. Robinson as described in a deed recorded in said Registry in Book 31889, Page 194;

10) S 34°34'17" E by said land of Robinson a distance of One Hundred Eighteen and 82/100 (118.82) feet to a point;



11) N 54°51'25" E by said land of Robinson, land now or formerly of Mark Bessire and Aimee Bessire as described in a deed recorded in said Registry in Book 27820, Page 339, and land now or formerly of Stephen Dyro as described in a deed recorded in said Registry in Book 30108, Page 100 a distance of Four Hundred Thirteen and 77/100 (413.77) feet to a point at the southwesterly sideline of said Emery Street;

12) S 35°05'25" E by said Emery Street a distance of Three Hundred Fifty and 71/100 (350.71) feet to the point of beginning.

Bearings are referenced to grid north, Maine State Plane Coordinate System, West Zone, NAD83.

The above described parcel contains 366,067 square feet / 8.40 acres. Meaning and intending to describe a portion of property as described in a deed recorded in the Cumberland County Registry of Deeds in Book 29147, Page 254.

SECTION 5

PUBLIC OR PRIVATE RIGHTS-OF-WAY

The City of Portland has tentatively granted acceptance to allow the easterly garage entrance to be located within the Emery Street (Paper Street) Right-of-Way. There are no additional private or public encumbrances of the development parcel.

SECTION 6

SCHEDULE

The proposed project is currently under design with a targeted construction start date of March 2020 and completion slated for early 2022.

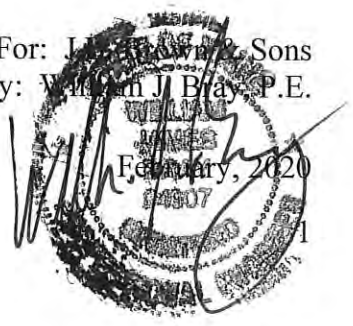
TRAFFIC IMPACT STUDY

FOR



PROPOSED

Department of Veterans Affairs

"Community Based Outpatient Clinic"

Prepared For: J. [illegible] & Sons

Prepared By: William J. Bray, P.E.

February, 2020

INTRODUCTION

FDS JBB Portland, LLC are proposing to construct a 62,170 square foot two-story building on an 8.40-acre site located at 113 West Commercial Street. The Federal Department of Veterans Affairs (VA) will lease the proposed building creating a Community Based Outpatient Clinic. The proposed development includes a total of 532 on-site parking spaces with 150 surface parking spaces and 382 spaces within a three-level garage structure. The VA's lease agreement requires the applicant to provide a total of 400 on-site parking spaces to meet their programming needs. The remaining 132 unencumbered parking spaces within the proposed parking garage are presently being considered for accommodating existing parking needs of marine dependent businesses located along the Portland Waterfront.

There will be three primary driveways into the site from West Commercial Street. All three driveways are proposed to be unsignalized. The westerly driveway will provide primary access for staff/employees to the 150-space surface parking lot. Staff parking is located on the west side of the building to provide convenient access to the proposed building, as staff entry is differentiated from patient/visitor access into the building. The central driveway is the primary patient/visitor access route and it is located between the clinic building and the proposed site garage to allow for ease of patient access to the clinic building, as well as, vehicular movements in/out of the garage. The most easterly driveway is located east of the parking structure and will provide access for entering and exiting movements out of the garage. The driveway also provides for emergency and heavy vehicle movements around the garage and to the rear of the parking structure avoiding conflicts with other site uses through the westerly and central access driveways.

It is expected that each of the three driveways will require a separate left-turn lane treatment for entry movements to the site from West Commercial Street. These lanes and the projected volumes of traffic through them are not expected to significantly overlap with left-turn movements into the Canal Landing Boat facility. The Canal Landing site design also provides three points of access onto West Commercial Street with the central and far westerly driveways infrequently used and carrying limited traffic volumes. The most easterly driveway into the boat yard is located approximately 250-feet east of the proposed parking garage. The Canal Landing traffic volumes are very low and are not expected to conflict with traffic generated by the proposed clinic site.

The proposed project requires the applicant to receive approval for a Traffic Movement Permit (TMP) and Planning Board approval from the City of Portland. A TMP application was filed with the City on December 3, 2019 followed by a project scoping meeting conducted on Monday, December 30, 2019. The City's Traffic Consultant, at that time, identified a full traffic impact study would be required in support of the permit application.

The City's Traffic Consultant and Planning Staff determined the study area would include the following intersections:

Commercial Street @ Beach Street
West Commercial Street @ Cassidy Point Drive
West Commercial Street @ Valley Street
Valley Street/St. John Street and Danforth Street
West Commercial Street @ Fore River Parkway

The traffic study requirements were further defined as follows:

- There was concurrence that the 10th edition of the ITE **"TRIP GENERATION"** manual was reasonable to use for the study. The City's Traffic Consultant advised that the State Traffic Engineer has authorized use of the 10th edition in the conduct of this traffic impact study.

- The Applicant will provide additional information on employee levels, current information on patients, etc. This item will be addressed under separate cover.

- Given the magnitude of difference between the Peak Hour of Adjacent Traffic and Generator, the traffic analysis is to include a sensitivity analysis of how the higher trip level may impact traffic operations.

- Other development projects to be included in the required traffic impact study to include the following development sites: 383 Commercial Street, Canal Landing, 184 Commercial Street, EWTMP, 58 Fore Street, Portland Square, MMC, Mercy Hospital, Thompson Point and Portland Transportation Center.

- The applicant shall provide backup data that supports the assignment (employee residence). There was a request to gain an understanding of patient origins as part of this analysis. This item will be addressed under separate cover.

- The application identified one HCL location at Commercial Street and Beach Street and it was requested that 2019 data be reviewed and mitigation strategies be identified. It was also requested that the crashes at the West Commercial Street/Valley Street intersection be reviewed.

EXISTING TRAFFIC

Existing Design Hour Traffic: Manual traffic turning movement counts were collected during both weekday peak commuter hours at four traffic intersections located within the general vicinity of the proposed site. The locations and the date of the data collection are listed as follows:

1. Commercial Street @ Beach Street – August 13, 2019
2. West Commercial Street @ Fore River Parkway – August 14, 2019
3. West Commercial Street @ Valley Street – August 15, 2019
4. West Commercial Street @ Cassidy Point Drive – 1-9-2020

All traffic entering and exiting each intersection was recorded in 15-minute intervals between 7:00 and 9:00 a.m. and, again, between 3:00 and 6:00 p.m. (Copies of the traffic data is attached as an appendix to the report). From a summary of the data, it was determined that the "*morning*" peak hour falls between 7:30 and 8:30 a.m. at each of the four study intersections and the "evening" peak hour occurs between either 4:30 and 5:30 or 4:45 and 5:45 p.m. at each of the noted study intersections.

Traffic data collected during the months of July and August is generally representative of "peak" travel conditions and further adjustment is not required.

Traffic data collected during the months of September through June typically requires an adjustment to reflect "*peak*" travel conditions found during the summer months of July and August. The traffic data collected at Location #4, West Commercial Street @ Cassidy Point Drive, was collected to only establish entry and exit volumes from Cassidy Point Drive; through traffic volumes in both directions on West Commercial Street were based upon traffic data collected at the West Commercial Street/Valley Street intersection during August 2019.

Figure 1 illustratively depicts the estimated 2019 Design Hour Traffic conditions at each of the five study intersections.

TRAFFIC SAFETY

Existing Safety Trends: MaineDOT's Accident Records Section provided the latest three-year (2016 through 2018) crash data for the section of West Commercial Street between Beach Street and the Fore River Parkway, a distance of 1.40 miles. MaineDOT's report is presented as follows:

Table 1
2016 -2018 Traffic Accident Summary

Location	Total Crashes	Critical Rate Factor
1. West Commercial Street @ Valley Street	26	0.75
2. West Commercial Street @ Beach Street	**30**	**1.17**
3. West Commercial Street @ Cassidy Point Drive	5	0.37
4. West Commercial Street btw. Fore River Parkway and Valley Street	3	0.29
5. West Commercial Street btw. Valley Street and Cassidy Point Drive	1	0.27
6. West Commercial Street near Benny's Diner	2	0.65
7. West Commercial Street btw. gravel turnout and Beach Street	12	0.51

The MaineDOT considers any roadway intersection or segment a high crash location if both of the following criteria are met:

- ***8 or more accidents***
- ***A Critical Rate Factor greater than 1.00***

Commercial Street/Beach Street/IMT Entrance: As the data presented in the table shows, the intersection of West Commercial Street and Beach Street meets both of MaineDOT's criteria for identification of a high crash location, with a total of 30 crashes and a corresponding critical rate factor of 1.17. MaineDOT provided a detailed vehicle collision diagram for the intersection that maps the crash patterns of each of the 30 vehicle collisions. That document visually presents two very distinct crash patterns occurring within the intersection; 18 crashes are "rear-end" crashes involving thru vehicles on both approaches of West Commercial Street colliding with a second vehicle traveling in the same direction. A second crash pattern were "angle" collisions with a total of four incidences involving a motorist turning left from the eastbound approach of West Commercial Street to Beach Street struck by a thru vehicle traveling westbound through the intersection.

2019 crash data was obtained from the MaineDOT for the Commercial Street/Beach Street intersection to further understand and evaluate the higher than expected frequency of traffic crashes reported for the intersection.

The MaineDOT updated (2017 through 2019) crash data for the Commercial Street/Beach Street intersection shows a very minor reduction in the number of crashes at the intersection (28 crashes vs. 30 crashes), and a minor change in the critical rate factor (1.09 vs. 1.17). The crash patterns presented in the more current crash data continue to show a high number of "rear-end" crashes (17 crashes) and a slight up-tick in the number of "angle" crashes with a total of 7 crashes. The MaineDOT crash diagram identifies that 13 of the 28 vehicle crashes occurred during either the morning or afternoon peak commuter hours, when traffic loadings are at peak conditions.

Traffic Solutions conducted a detailed review of traffic operations within the intersection to identify any plausible mitigation measures that potentially could improve traffic safety conditions within the intersection. The following findings and/or recommendations summarize that effort:

Operational Observations

- The average travel speeds of motorists traveling east on Commercial Street appears well in excess of the posted speed limit of 30mph.

- Drivers turning left from Commercial Street onto Beach Street during the permissive signal phase routinely complete the desired turn using very short vehicle gaps, oftentimes forcing westbound thru Commercial Street traffic to either slow or stop in the intersection. Very few motorists attempting the desired left-turn are able to complete the turn safely during the evening peak hour with the excessively heavy traffic volumes traveling westbound on Commercial Street.
- Motorists on the Beach Street approach make a right-turn on red onto Commercial Street using very short vehicle gaps in the thru traffic stream.
- Motorists turning left from Commercial Street onto Beach Street were found "running the red light" generally during each traffic signal cycle, creating numerous near misses with opposing traffic. This observed safety condition is clearly affirmed with the high number of reported left-turn crashes occurring at the intersection.

Recommended Mitigation Measures

- Prohibit "*Right-Turn on Red*" turns from the Beach Street approach.
- Add a "*Red Signal Ahead*" Advance Traffic Light Warning Road Sign on the outside of the curve on the east approach of Commercial Street.
- Add improved directional sign on West Commercial Street in advance of the left-turn lane to Beach Street providing approaching drivers with clear destination information; such as, Casco Bay Bridge Left-Lane, Old Port Area Thru Lane.
- Long Term the City may want to consider changing the permissive/protected signal phase for left-turns to Beach Street to address the number of crashes involving left-turn movements in the intersection.

West Commercial Street @ Valley Street: Traffic safety conditions reported by MaineDOT for the study intersection of West Commercial Street and Valley Street shows a total of 26 vehicle crashes occurred at the intersection between the years of 2016 through 2018. Although this location doesn't meet MaineDOT's criterion as a high crash location, the City Reviewers requested a review of the intersection to determine what possible mitigation measures could be implemented to reduce the high number of traffic crashes occurring within the intersection. The primary crash pattern in the intersection; again, similar to the findings at the Beach Street intersection is "*rear-end*" crashes with a total of 9 crashes; a second crash pattern with a total of 6 crashes were "*angle*" crashes and a final crash pattern with a total of 5 reported crashes were "*side-swipe*" crashes involving motorists traveling in either the dual left-turn or right-turn lanes in the intersection.

This location doesn't currently meet MaineDOT's criterion as a high crash location, however, the number of reported crashes is somewhat excessive. Traffic Solutions has conducted a field review of existing traffic operations and provided a listing of possible mitigation measures for consideration.

Operational Observations

- The dual left-turn lanes on the West Commercial Street approach unknowingly direct approaching drivers unfamiliar with the area into a possible lane entrapment condition at the connecting signalized intersection at St. John Street @ Valley Street.
- White painted "*dot-lines*" guiding turning traffic through the intersection are not present in either the dual left-turn or right-turn lanes. Drivers using both dual lanes routinely were observed straddling both turn lanes. This driver action occasionally creates near misses with aggressive approaching drivers.
- Lane markings on the Valley Street approach at West Commercial Street do not extend to the St. John Street intersection, which creates confusion as to the required lane utilization on the approach.

Recommended Mitigation Measures

- Stripe white "*dot-dash*" lines through the intersection for both the dual left and right-turn traffic movements. This proposed striping improvement coupled with the following signing recommendation could potentially limit the number of side-swipe crashes occurring in the intersection.
- The City working with MaineDOT should consider adding advance directional lane utilization sign messages that inform approaching drivers which of the dual left-turn lanes to use in advance of the St. John Street/Danforth Street intersection.
- The entire length of the Valley Street approach at West Commercial Street extending back to the St. John Street intersection should be striped with white lane use and symbol markings.
- The City may want to consider adding additional lane use symbols on all approaches to better inform approaching drivers of the intended lane uses on each intersection approach.

SITE TRAFFIC

Site Trip Generation - Community Based Outpatient Clinic: Trip generation for the proposed Veterans Affairs Clinic project is based upon tables presented in the 10th edition(1) of the Institute of Transportation's Engineers "**TRIP GENERATION**" manual. The following trip rates were applied in that effort:

Land-Use Code 630 – Clinic [62,170 square foot building]

Weekday Street Peak Hour – AM Peak	= 3.69 trips/1,000sf
Weekday Street Peak Hour – PM Peak	= 3.28 trips/1,000sf
Weekday Peak Hour of Site – AM Peak	= 5.22 trips/1,000sf
Weekday Peak Hour of Site – PM Peak	= 4.64 trips/1,000sf

(1) NOTE: MaineDOT requires the use of trip tables presented in the 7th edition of the ITE publication for estimating all trip generation for development projects requiring a Traffic Movement Permit. The earlier publication provides very minimal peak hour trip generation data for a clinic site; as a result, trip data in the 10th edition was applied. This process was reviewed with the State Traffic Engineer and approved for site trip calculation purposes.

Table 2, below, provides a summary of the trip generation for the proposed Community Based Outpatient Clinic project:

Table 2
Peak Hour Trip Generation Summary

Peak Hour Time Period	Peak Hour Trip Generation
AM Peak Hour (Street)	229 trips
PM Peak Hour (Street)	204 trips
AM Peak Hour (Generator)	325 trips
PM Peak Hour (Generator)	288 trips

As highlighted in the preceding Table 2, the proposed Veterans Administration's Community Based Outpatient Clinic (CBOC) development is expected to generate a total of **229** trips during the morning street peak hour and a slightly less volume of trips (**204** trips) in the evening peak hour of the street. Site trip projections for both the morning and afternoon peak hours of the clinic site are somewhat higher at 325 trips mid-morning of a typical weekday and 288 trips mid-afternoon of the proposed site.

Site Trip Generation – Extra Parking Garage Trips (Existing Marine Dependent Businesses): The remaining 132 unencumbered parking spaces within the proposed parking garage are presently being considered for accommodating existing parking needs of marine dependent businesses located along the Portland Waterfront. Trips generated by occupants of these parking spaces will most likely arrive and depart the parking structure during times of the day or evening other than the peak hours of a typical weekday. However, to project a "*worse-*

case" condition, trips generated by these extra garage spaces have been estimated based upon existing peak hour parking trends found at an existing waterfront parking garage. The parking garage data shows that approximately 33% of the garage capacity enters or exits the structure in the AM peak hour with a directional split of 89% entering the garage and 11% exiting. The parking trends found in the evening peak hour are similar but reversed from the AM trends, with approximately 27% of the garage capacity entering or exiting the garage. The PM peak hour distribution shows about 14% of the PM trips enter and 86% exit the parking garage. These trip patterns were applied in estimating the existing garage trips that potentially will be generated by the extra (132) garage spaces in the proposed garage. Accordingly, the extra garage spaces can be expected to generate a total of 44 trips in the AM peak hour and 36 spaces in the evening peak hour. Thirty-nine of the morning trips and five of the afternoon trips will enter the garage and the remaining trips (5 AM peak and 31 PM peak) will exit.

Vehicle Trip Composition: This report has assumed all vehicle trips generated by the proposed VA Clinic site are "*primary*" or "*new*" vehicle trips to the area street network. Trips generated by the existing marine dependent businesses are existing trips presently circulating along the Commercial Street corridor, as such, their actual traffic impacts are limited to the most easterly driveway entrance to the proposed parking structure.

Site Trip Distribution VA Clinic Site: The 10th Edition of the Institute of Transportation Engineers "**TRIP GENERATION"** publication provides the following trip distributions rates for a proposed clinic site:

Land-Use Code 630 – Clinic

AM Peak Hour Street)	= 78% enter/22% exit
PM Peak Hour (Street)	= 29% enter/71% exit
AM Peak Hour (Generator)	= 58% enter/42% exit
PM Peak Hour (Generator)	= 46% enter/54% exit

Table 3, as follows, summarizes the peak hour directional distributional volumes for the proposed CBOC site:

Table 3
Site Trip Distribution Summary

Peak Hour Time period	CBOC Building Trip Distribution Volumes		Total Trips
	Enter	Exit	
AM Peak Hour (Street)	179 trips	50 trips	229 trips
PM Peak Hour (Street)	59 trips	145 trips	204 trips
AM Peak Hour (Generator)	189 trips	136 trips	325 trips
PM Peak Hour (Generator)	132 trips	156 trips	288 trips

Accordingly, in the morning peak hour of the street, the heaviest volume of trips (179 trips) enter the site and in the evening peak hour a reverse pattern occurs with 145 trips exiting the site. The remaining trips (50 trips) in the morning peak hour will exit the site and 59 trips in the evening peak hour enter the site.

Projected trip patterns occurring during the mid-morning and mid-afternoon peak hours of the site are estimated at 189 trips entering the site in the mid-morning peak hour and 156 trips exiting the site in the mid-afternoon peak hour. The remaining balance of 136 trips in the morning peak hour exits the site and the remaining trips (132 trips) in the afternoon peak hour enters the site.

Site Trip Distribution – Existing Marine Dependent Businesses: Parking operational data gathered for an existing parking structure located in the Eastern Waterfront section of the City provides the following existing distribution patterns for the 132 parking garage spaces:

AM Peak Hour – Total of 44 Trips	PM Peak Hour – Total of 36 Trips
39 trips enter/5 trips exit	5 trips enter/31 trips exit

Vehicle Trip Assignment – Proposed VA Clinic Site: The Department of Veterans Affairs provided general residency information for employees presently working at the 144 Fore Street facility in the City of Portland that shows the majority of employees reside in Portland, South Portland, Yarmouth and Falmouth. They have also advised that the expected service area of the proposed Clinic will encompass the majority of Cumberland and York counties.

A population-based traffic model was considered an appropriate instrument for assigning site generated traffic to the study area intersections. The site travel model includes the 2010 Census population of 17 municipalities generally located in the Greater Portland Area that have a combined 2010 population of 277,240 persons. Communities located both south and north of the Greater Portland Area were purposely omitted from the model development, understanding Veterans currently have other clinical options located both north and south of the proposed Portland site.

The travel model process divides the 2010 population value of each community by the total population of the 17 municipalities (277,240) and assigns the resultant percent value; either partially or fully, to one of four general travel routes to the proposed Clinic site: 1) Fore River Parkway; 2) Veterans Parkway; 3) Commercial Street East and 4) Casco Bay Bridge.

Table 4 presents the results of the population-based trips model process. As highlighted on the noted table, approximately 47% of the site trips will use the Fore River Parkway to access the proposed Clinic site; 33% will travel across the Veterans Bridge to access the site and about 11% of the site traffic will use Commercial Street from the east while the remaining 9% will use the Casco Bay Bridge for access. The trip assignment process also includes further minor trip adjustments directing lesser volumes of trips through the Valley Street/St. John Street/Danforth Street intersection. These minor trip adjustments were generally based upon existing vehicle splits found at the study intersection during both peak hour time periods.

Table 4
Population Based Model
Travel Assignment Summary
VA Community Based Outpatient Clinic

Community Name	2010 Population	Percent of Total	Site Trip Assignment (Percentage)			
			Fore River Pkwy.	Veterans Bridge	Commercial Street (E)	Casco Bay Bridge
Portland	66,193	23.9	15	-	8.9	-
Scarborough	18,910	6.8	-	6.8	-	-
South Portland	25,004	9.0	-	3.5	-	5.5
Cape Elizabeth	9,013	3.3	-	-	-	3.3
Falmouth	11,180	4.0	3.5	-	0.5	-
Westbrook	17,515	6.3	4.8	0.5	-	-
Cumberland	7,203	2.6	2.0	-	1.0	-
Freeport	7,878	2.8	2.8	-	0.6	-
Windham	16,997	6.1	6.1	-	-	-
Gorham	16,371	5.9	4.8	1.0	-	-
N. Yarmouth	3,573	1.3	1.3	-	-	-
Yarmouth	8,350	3.0	3.0	-	-	-
Standish	9,872	3.6	3.6	-	-	-
Saco	18,482	6.7	-	6.7	-	-
Biddeford	21,277	7.7	-	7.7	-	-

Kennebunk	10,798	3.9	-	3.9	-	-
Old Orchard Beach	8,624	3.1	-	3.1	-	-
TOTAL			**46.9%**	**33.3%**	**11.0%**	**8.8%**
	277,240	**100%**	**80.2%**		**19.8%**	

Site Trip Assignment – Existing Marine Dependent Businesses: These trips are existing trips presently traveling the Commercial Street corridor. Trips generated by these existing businesses, again, were directionally assigned through the most easterly garage driveway entrance applying the general directional assignment paths presented in Table 4 above. The trip assignment for these existing trips require minor adjustments to the projected through volumes along Commercial Street. Minor volumes of through trips were appropriately reduced for the AM peak hour and increased in the PM peak hour.

Figures 2a and 2b illustratively present traffic assignments, respectively, for the morning and evening peak hours of the street.

Site Trip Assignment – Peak Hour of Generator (Sensitivity Analysis): A trip assignment was prepared representing trip generation for both the AM and PM peak hour of the generator in conducting the requested sensitivity analysis. Table 2, above, establishes the volume of AM and PM peak hour trips generated by the proposed project during the AM and PM peak hour of the site (generator). The trip projections are shown as follows:

AM Peak Hour = 325 trips
PM Peak Hour = 288 trips

These vehicle trips were then assigned through the study intersections applying the directional travel routing information presented in the preceding Table 4.

Figures 2c and 2d present the trip assignments prepared for the AM and PM peak hours of the site (generator), respectively.

2022 PRE- AND POST-DEVELOPMENT TRAVEL FORECASTS

Other Development Traffic: Traffic generated by projects that have been approved by the local Planning Board and/or the Maine Department of Transportation, yet are not opened, must be included in the estimate of pre-development traffic. The City has advised that trips generated by the following projects must be included as other development trips through the study intersections:

383 Commercial Street	*58 Fore Street*
Canal Landing	*Portland Square*
184 Commercial Street	*MMC*
EWTMP	*Mercy Hospital*
Thompson's Point	*Portland Transportation Center*

Site trips generated by each of these listed development sites were appropriately assigned through the study intersections and these assignments are illustratively highlighted on Figure 3.

2022 Design Hour Traffic: The VA Clinic project is expected to be completed in 2022; therefore, 2019 design hour traffic volumes shown on Figure 1 require an annual adjustment to forecast 2022 travel conditions at each of the study intersections. Annual growth rates of less than 1% per year have been applied in recent development projects in the City. Traffic Solutions has applied a more conservative 1% growth adjustment in projecting 2022

travel conditions at the study intersections. Figure 4 illustratively presents the estimated 2022 design hour traffic volumes for the study intersections.

2022 Pre-Development Traffic: Future 2022 pre-development travel conditions were prepared for the study intersections by combining the Other Development traffic presented on Figure 3 with the 2022 Design Hour traffic forecasts presented on Figure 4. Figure 5 presents the estimated 2022 pre-development travel forecasts for the study intersections.

2022 Post-Development Traffic: Separate 2022 post-development traffic assignments were prepared for: 1) Peak Hour of the Street Conditions and 2) Peak Hour of the Generator Travel Conditions (Sensitivity Analysis). Figures 6a and 6b illustratively present the 2022 post-development traffic forecasts for the former travel period during the AM and PM peak hours, respectively, and Figures 7a and 7b highlight the projected 2022 post-development assignments for the peak hours of the generator travel conditions.

MOBILITY ANALYSIS

Capacity analyses of 2022 Pre- and Post-development traffic conditions forecast for each study intersection were conducted utilizing the Synchro and Sim Traffic computer traffic models. Two 2022 post-development travel conditions were analyzed: 1) peak hour trip generation projected for the peak hours of the street and 2) peak hour trip generation representative of the peak hour of the generator (sensitivity analysis). Lastly, traffic operations at each of the three proposed driveway entrances to the proposed site were evaluated, again, for both defined travel conditions.

Levels of Service rankings are similar to the academic grading system, where an "A" is very good with little delay and "F" represents very poor conditions.

The following table summarizes the relationship between delay and Level of Service for a signalized intersection:

Level of Service Criteria for Signalized Intersections

Level of Service	Total Control Delay (sec/veh)
A	Up to 10.0
B	10.1 to 20.0
C	20.1 to 35.0
D	35.1 to 55.0
E	55.1 to 80.0
F	Greater than 80.0

Each of the five study intersections for the 2022 pre-development condition were evaluated based upon existing intersection geometry and traffic signal timing and phasing inputs. The analyses conducted for both 2022 post-development conditions, again, are based upon existing intersection geometry, signal timing and optimization of signal timing inputs. Table 5, as follows, provides the results of the capacity analyses conducted for each of the five signalized study intersections for both the 2022 pre- and post-development travel conditions:

Table 5
Signalized Intersection Capacity Analysis
2022 Pre- and Post-Development Conditions

	2022 Pre-Development				2022 Post-Development Peak Hour Volumes (Street)				2022 Post-Development Peak Hour Volumes (Generator)			
	AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour

Each of the five study intersections are expected to operate overall at acceptable levels of service in the morning peak hour under projected 2022 pre-development travel conditions. Vehicle delay values less than 25 seconds were determined for all of the study intersections, which is representative of Level of Service C travel conditions - an acceptable level of service. Similar results are forecast during the PM peak hour at four of the five locations (Locations 2 thru 5), where forecast overall traffic operations meet acceptable levels of service. Vehicle delay values less than 40 seconds were calculated for each of the four identified study intersections. Traffic operation results determined for the final intersection at Commercial Street/Beach Street and the IMT Driveway entrance location are significantly different; whereby, thru traffic in both directions on Commercial Street will experience excessive vehicle delay, typical of Level of Service E/F travel conditions.

The 2022 post-development analysis evaluates two travel assignments: 1) 2022 Post-Development (Street Volumes) and 2) 2022 Post-development (Generator Volumes) for both peak hour time periods. The simulation model results show traffic operation conditions in the morning peak hour for both travel assignment conditions are very similar to the results determined for the 2022 pre-development travel conditions. [***The Reader is cautioned that the post-development results reflect traffic signal timing optimization at each of the five study intersections. These traffic signal timing adjustments help minimize the overall traffic impacts generated by the added site traffic.***] Each intersection in the morning peak hour, under both described traffic loadings, will operate overall at Level of Service C or better travel conditions. Conditions found in the evening peak hour are also very similar to the results determined for the 2022 pre-development evening peak hour. Vehicle delay and level of service values determined for locations 2 thru 5 meet and/or exceed Level of Service C travel conditions. Again, traffic conditions measured for Location #1: Commercial Street/Beach Street/IMT Driveway Entrance intersection show excessive vehicle delay is expected under both forecast travel conditions. Notably, thru traffic traveling westbound on Commercial Street will experience average vehicle delays in excess of 90 seconds in the evening peak hour under both travel assignment conditions.

Post-development travel conditions at each of the three unsignalized site driveway intersections with West Commercial Street were evaluated assuming dual (left and right) exit lanes on each of the three driveway approaches and construction of a Center Two-Way Left-Turn Lane on Commercial Street for accommodating left-turn entry traffic to each driveway entrance. Two travel conditions were evaluated; 2022 Post-Development (Street Volumes) Condition and 2022 Post-Development (Generator Volumes) Condition.

The following table summarizes the relationship between delay and Level of Service for an unsignalized intersection:

Level of Service Criteria for Unsignalized Intersections

Level of Service	Total Control Delay (sec/veh)
A	Up to 10.0
B	10.1 to 15.0
C	15.1 to 25.0
D	25.1 to 35.0
E	35.1 to 50.0
F	Greater than 50.0

The results of the dual analyses conducted for each of the three proposed site driveway intersections are presented in the following Table 6:

Table 6

- Overall	3 sec	A	4 sec	A	3 sec	A	4 sec	A

The preceding table 6 clearly demonstrates that each of the proposed site driveway intersections at W. Commercial Street will meet and exceed the parameters for Level of Service A travel conditions. Motorists exiting through each of the three site driveways are only minimally delayed in both left and right turns onto W. Commercial Street. Vehicle delay values of 29 seconds or less were determined from the site driveway exit lanes onto W. Commercial Street.

VEHICLE QUEUE ASSESSMENT

A vehicle queuing analysis was conducted using the SimTraffic microsimulation traffic software. The model was set up in a manner that vehicles exiting left out of the three site driveways would use the CTWLTL before merging with EB Commercial Street through traffic. Generally, the model shows that for the post-development scenarios (as well as the model using trip generation based on the generator peak hour traffic) a 95th percentile queue length of 2 to 3 cars for each critical entry and exit lane. The exception occurs at the employee surface lot in the AM peak hour where left-turn entry trips to the parking lot peak at around 290-feet. Adequate vehicle storage should be provided in the CTWLTL lane of at least 300-feet to ensure sufficient storage is provided to accommodate the expected vehicle queue.

Post-Development AM

Secondary Entrance	50	34	70
Employee Entrance	61	36	63
Main Entrance	58	36	70

SIGHT DISTANCE

The City of Portland's Technical Standards require the following sight distance standards for a non-mobility roadway:

Sight Distance Standards

Speed Limit	Sight Distance
25 mph	200 feet
30	**250**
35	305
40	**360**
45	425
50	495
55	570

West Commercial Street is currently posted at 40mph across a portion of the frontage of the proposed site, with the remaining section posted at 30mph. The City's Technical Standards require an unobstructed sight distance of 250-feet for a posted speed limit of 30mph and 360-feet for a 40mph speed limit. A clear line-of-sight in excess of 500-feet was measured "*looking*" in both directions from each of the three proposed driveway entrances to the site.

SUMMARY

1. The proposed Veterans Administration's Community Based Outpatient Clinic (CBOC) development is expected to generate a total of **229** trips during the morning street peak hour and a slightly less volume of trips (**204** trips) in the evening peak hour of the street. Site trip projections for both the morning and afternoon peak hours of the clinic site are somewhat higher at 325 trips mid-morning of a typical weekday and 288 trips mid-afternoon of the proposed site.

2. An additional 44 trips in the morning peak hour and 36 trips in the evening peak hour are also generated by the surplus parking spaces in the proposed parking garage. The site design creates an additional 132 parking spaces not required by the Veterans Administration CBOC project. These extra parking spaces are currently being considered for accommodating existing parking needs of existing marine dependent businesses located along the Portland Waterfront. Trips generated by occupants of these extra site parking spaces, which will ingress and egress the proposed garage structure through the most easterly garage entrance, are existing trips presently found on Commercial Street. It is very likely that most of these vehicle trips occur during times other than the peak travel times of a typical day. However, to project a "*worse-case*" condition, trips generated by these extra garage spaces have been appropriately combined with the peak hour trip totals for proposed VA Clinic site.

3. MaineDOT's Accident Records Section provided the latest three-year (2016 through 2018) crash data for the section of West Commercial Street between Beach Street and the Fore River Parkway. The road safety data identifies a single intersection as a high crash location. MaineDOT considers any roadway intersection or segment a high crash location if both of the following criteria are met:
    - ***8 or more accidents***
    - ***A Critical Rate Factor greater than 1.00***

    As the data presented in the table shows, the intersection of West Commercial Street and Beach Street meets both of MaineDOT's criteria for identification of a high crash location with a total of 30 crashes and a corresponding critical rate factor of 1.17. MaineDOT provided a detailed vehicle collision diagram for the intersection that maps the crash patterns of each of the 30 vehicle collisions. That document visually presents two very distinct crash patterns occurring within the intersection; 18 crashes are "rear-end" crashes involving through vehicles on both approaches of West Commercial Street colliding with a second vehicle traveling in the same direction. A second crash pattern were "angle" collisions with a total of four incidences involving a motorist turning left from the eastbound approach of West Commercial Street to Beach Street stuck by a thru vehicle traveling westbound through the intersection. Further review of this intersection was completed based upon safety data provided by MaineDOT for the study years of 2017 through 2019. The more current safety data shows a similar but slightly lower number of crashes (28) and a lower critical rate factor of 1.09 than the data presented for the 2016 thru 2018 study period.

    Further review of traffic operations within the intersection were conducted to determine if intersection geometry and/or driver behaviors were potentially impacting the higher than expected level of traffic crashes. The findings of the field review show:
    - Average travel speeds of motorists traveling east on Commercial Street appear well in excess of the posted speed limit of 30mph.
    - Drivers turning left from Commercial Street onto Beach Street during the permissive signal phase routinely complete the desired turn using very short vehicle gaps, oftentimes forcing westbound thru Commercial Street traffic to either slow or stop in the intersection.
    - Very few motorists attempting the desired left-turn onto Beach Street are able to complete the turn safely during the evening peak hour with the excessively heavy traffic volumes traveling westbound on Commercial Street.
    - Motorists on the Beach Street approach make a right-turn on red onto Commercial Street using very short vehicle gaps in the thru traffic stream.
    - Motorists turning left from Commercial Street onto Beach Street were found "running the red light" generally during each traffic signal cycle, creating numerous near misses with opposing traffic. This observed safety condition is clearly affirmed with the high number of reported left-turn crashes occurring at the intersection.

Traffic Solutions would recommend four possible mitigation measures that with implementation, may potentially improve existing safety conditions.

Recommended Mitigation Measures

- Evaluate the long-term safety benefits of converting the Eastbound Commercial Street permissive/protected Beach Street left-turn traffic signal phase to a protected signal phase, only.
- Prohibit "*Right-Turn on Red*" turns from the Beach Street approach.
- Add a "*Red Signal Ahead*" Advance Traffic Light Warning Road Sign on the outside of the curve on the east approach of Commercial Street.
- Add improved directional signage on West Commercial Street in advance of the left-turn lane to Beach Street providing approaching drivers with clear destination information; such as, Casco Bay Bridge Left-Lane, Old Port Area Thru Lane.

West Commercial Street @ Valley Street Intersection: A detailed safety review of this signalized intersection was completed as directed by the City Staff and Traffic Peer Review Consultant. Although this location doesn't currently meet MaineDOT's criterion as a high crash location, the number of reported crashes is somewhat excessive. MaineDOT's most recent 2016 through 2018 report shows a total of 26 vehicle crashes occurred at the intersection. The primary crash pattern occurring in the intersection; again, similar to the findings at the Beach Street intersection, is "*rear-end*" crashes with a total of 9 crashes. A second crash pattern with a total of 6 crashes were "*angle*" crashes and a final crash pattern with a total of 5 reported crashes were "*side-swipe*" crashes involving motorists traveling in either the dual left-turn or right-turn lanes in the intersection.

Traffic Solutions conducted a field review of existing conditions at the intersection with the following comments:

- The dual left-turn lanes on the West Commercial Street approach lead approaching drivers unfamiliar with the area into a possible lane entrapment condition at the connecting signalized intersection at St. John Street @ Valley Street.
- White painted "*dot-lines*" guiding turning traffic through the intersection are not present in either the dual left-turn or right-turn lanes. Drivers using both dual lanes routinely were observed unknowingly straddling both lanes. This driver action occasionally creates near misses with aggressive approaching drivers.
- Lane markings on the Valley Street approach at West Commercial Street do not extend to the St. John Street intersection, which creates confusion as to the required lane utilization on the approach.

Traffic Solutions suggests the following possible mitigation measures for improving safety conditions at the intersection.

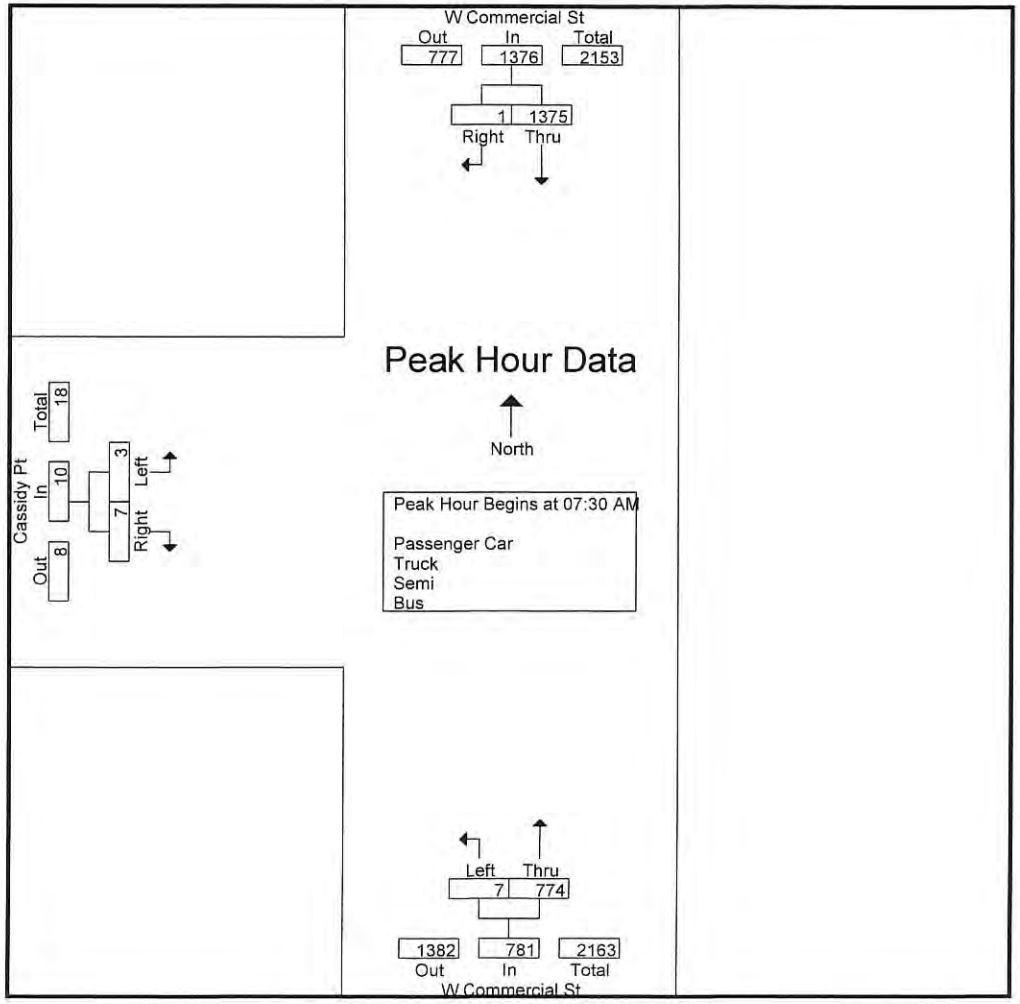
- Stripe white "*dot-dash*" lines through the intersection for both the dual left and right-turn traffic movements. This proposed striping improvement coupled with the following signing recommendation could potentially limit the number of side-swipe crashes occurring in the intersection.
- The City working with MaineDOT should consider adding advance directional lane utilization sign messages that inform approaching drivers which of the dual left-turn lanes to use in advance of the St. John Street/Danforth Street intersection.
- The entire length of the Valley Street approach at West Commercial Street extending back to the St. John Street intersection should be striped with appropriate white lane and symbol markings.
- The City may want to consider adding additional lane use symbols on all approaches to better inform approaching drivers of the intended lane uses on each intersection approach.

4. Each of the five study intersections are expected to operate overall at acceptable levels of service in the morning peak hour under projected 2022 pre-development travel conditions. Similar results are forecast during the PM peak hour at four of the five locations (Locations 2 thru 5), where forecast overall traffic operations meet acceptable levels of service. Traffic operation results determined for the final intersection at Commercial Street/Beach Street and the IMT Driveway entrance location are significantly different; whereby, thru traffic in both directions on Commercial Street will experience excessive vehicle delay, typical of Level of Service E/F travel conditions.

5. Two 2022 post-development travel conditions were tested to determine the expected operational impacts at each of the five study intersections. These travel conditions included: 1) 2022 Post-Development (Street Volumes) and 2) 2022 Post-development (Generator Volumes) for both peak hour time periods. The simulation model results show traffic operation conditions in the morning peak hour for both travel assignment conditions are very similar to the results determined for the 2022 pre-development travel conditions. [***The reader is cautioned that the post-development results reflect traffic signal timing optimization at each of the five study intersections. These traffic signal timing adjustments help minimize the overall traffic impacts generated by the added site traffic.***] Each intersection in the morning peak hour, under both described traffic loadings, will operate overall at Level of Service C or better travel conditions. Conditions found in the evening peak hour are also very similar to the results determined for the 2022 pre-development evening peak hour. Vehicle delay and level of service values determined for locations 2 thru 5 meet and/or exceed Level of Service C travel conditions. Again, traffic conditions measured for Location #1: Commercial Street/Beach Street/IMT Driveway Entrance intersection show excessive vehicle delay is expected under both forecast travel conditions.

   City Staff and Consultant asked that the traffic analyses include a sensitivity analysis of how the higher peak hour trip levels projected for the peak hour of the generator potentially impact operations at the study intersections. A second traffic assignment, which added more than 80 peak hours trips in both peak hour time periods, was tested concurrently with the analyses completed for post-development travel conditions based upon site trip generation for the street peak hour. A "side-by-side" comparison of the results of the dual 2022 post-development analyses shows that the added site trips included in the second 2022 post-development travel condition has no measurable additional impact at each of the five study intersections.

6. The results of the detailed capacity analysis completed for each of the three site driveway intersections demonstrates that acceptable levels of service are provided at each site entrance. Each driveway intersection is projected to operate at Level of Service A travel conditions.



7. Generally, the model shows that for the post-development scenarios (as well as the model using trip generation based on the generator peak hour traffic) 95th percentile vehicle queue lengths of 2 to 3 cars are expected in each critical entry and exit lane. The exception occurs at the employee surface lot in the AM peak hour where left-turn entry trips to the parking lot peak at around 290-feet. Adequate vehicle storage should be provided in the CTWLTL lane of at least 300-feet to ensure sufficient storage is provided to accommodate the expected vehicle queue.

8. Acceptable vehicle sight distance is provided at each of the three proposed site driveway entrances. Sightline distances in excess of 500-feet was measured directionally at each of the three sight entrances.

PUBLIC INFRASTRUCTURE AND SAFETY

The following statements are provided in accordance with the submission and Section 14-526 of the ordinance.

(c) Public Infrastructure and Community Safety Standards.

Consistency with City Master Plans (14-526 (c) 1)

- *Identify consistency with master plans*
- *Proposed easements, rights and improvements to connect or continue off-premises public infrastructure, as applicable*

1. *Consistency with City Master Plans:*

    a. The project has been designed to be consistent with the B-5b Zoning and offsite infrastructure plans. The site is uniquely placed along the West Commercial Street corridor and its location in the City along a gateway corridor is considered ideal to visually communicate the VA's brand to the local public and veterans alike, and also while establishing the VA as recognized identity in the Portland Community. The implementation of the West Commercial Street multi-modal pathway into the site planning meets the objectives of previous City Studies and planning.

    b. The development will maintain various infrastructure, including utilities within West Commercial Street corridor and the Emery Street paper right of way. The existing CSO overflow control chamber in the west end of the site will remain unchanged and not impacted by the development.

Public Safety and Fire Prevention (14-526 (c) 2)

- *Address Crime Prevention through Environmental Design (CPTED) (Technical Manual, Section 3)*
- *Emergency vehicle access*
- *Address consistency with public safety standards (Technical Manual, Section 3)*
- *Submit a code summary referring NFPA 1 and all Fire Department standards (Technical Manual, Section 3) – Fire Checklist*

2. *Public Safety and Fire Prevention:*

    a. The site has been designed to promote a safe and welcoming environment. The VA will maintain security on the campus including building entry controls, restricted parking areas, and camera surveillance.

    b. The site provides access from three driveways for emergency vehicles.

    c. Fire hydrants are located along West Commercial Street and will be within 25' of the front corner of the garage. The clinic will be fully sprinklered and the parking garage will contain standpipes for Fire Department use. A summary letter to Division Chief Thompson is included at the end of this section.

Availability and Adequacy of Public Utilities (14-526 (c) 3) (Technical Manual, Sections 2 & 9)

- *Electrical services, including providing underground services*
- *Identify existing and proposed connections for public utilities and required public utility upgrades*
- *Sewer line connections are required, if there is a main within 200 feet*
- *Proposed solid waste management facilities on-site and management for the site*
- *Written evidence of the ability to serve from utility companies, as applicable*

a. The Applicant is securing letters from the applicable utilities stating their ability to serve the site. The project will require new electrical, gas, sewer, and water services to the clinic and power and sewer to the garage.

b. All new electrical services to the site will be underground.

c. All new utility infrastructure will meet the provisions of the Technical Manual. The Clinic will be served by new fire and domestic mains off the PWD 16" water main located in West Commercial Street. The building sewer will connect to the existing Fore River Interceptor sewer located along the front property line. Power will be from the existing overhead primary distribution system that CMP maintains on West Commercial Street.

d. The project will utilize a new service connections to the public sewer system within the Fore River Interceptor located along the site's front property line.

e. All new sewer and stormwater infrastructure will meet City standards. Backflow prevention in accordance with PWD standards will be provided in the buildings.

f. A solid waste collection and storage area will be provided with adequate capacity for the needs of the development. The VA will maintain their solid waste collection equipment at the rear of the clinic where it will be screened from view.

Ability to serve letters will be forwarded to the planning office upon receipt.

Att. M

DEPARTMENT OF VETERAN AFFAIRS

ARCHITECTURAL NARRATIVE

SMITHGROUP

November 15, 2019

ARCHITECTURAL NARRATIVE

Southfacing Exterior Rendering

ARCHITECTURAL NARRATIVE

Architectural Design Objective

SmithGroup is a nationally recognized leader in advocating the importance of architectural and interior design in the healing process. Implementing patient-centered design concepts has allowed the design team to be truly focused on the environmental needs of patients, while recognizing the importance of comfort and satisfaction for visitors and caregivers. To ensure the full understanding of the unique culture of each healthcare facility, the SmithGroup team conducts meetings with Clients, Patient advocates, and Stakeholders to address the most appropriate patient-centered and facility-directed design concepts that will improve patient outcomes and satisfaction.

SmithGroup also places a high value on stewardship of the environment through sustainable design. Our Healthcare projects emphasize the relationship to the environment and appropriate design responses for the climate. In addition, SmithGroup emphasizes the physical wellness of the patient, visitor, and caregiver. SmithGroup's projects include innovative patient and family amenities such as resource libraries, serenity or meditation rooms, natural light with exterior views, direct access to the outdoors, and custom regionally-inspired art.

The FD Stonewater, Landry/French Construction, and SmithGroup team for the Portland, Maine Community-Based Outpatient Clinic will emphasize the integration of these elements throughout the process to create a facility showcasing innovative design ideas within a framework of optimizing the healing environment for the body, mind, and spirit of our veterans. The site has abundant water views and is outside of the FEMA 100-year floodplain.

Location

Our proposed site for the CBOC is located on West Commercial Street in Portland, Maine within the Area of Consideration as shown in the RLP. The site is 10.66 acres in size and is unencumbered by existing structures for preservation, reuse or demolition. The developable portion of the site has approximately 8.3 acres of land and 1,500 linear feet of street frontage on West Commercial. Approximately four acres of the developable site is zoned B-5b, Commercial, which is where the CBOC would be located. The other 4 acres (on the uphill slope) is zoned R-4, Residential. Medical Clinic is a permitted use in the commercial zone and this makes the CBOC a use-by-right without need to seek special permitting on our site.

The proposed CBOC site is near I-295 and I-95 (Maine Turnpike) providing convenient access from the north and south and Route 77 providing access from Cape Elizabeth and points west. The site is also approximately one-half of a mile from the western edge of Portland's historic downtown and central business district. Maine Medical Center, a 637-bed teaching hospital, is less than one-mile away to the north of the CBOC site. A Portland Fire Department station is located 2.7 miles away from the Clinic at 684 Broadway, The topography of the site includes a relatively level area (coinciding with the commercial zone) and a steeper area which is part of the residential zone. The site provides views south to the Fore River and South Portland. West Commercial Street is a main entrance route to Portland and Cape Elizabeth and the CBOC's location and orientation will serve as a gateway to patients and travelers. As a result, the CBOC will visually communicate the VA's brand to the local public, establishing the VA as a recognized identity in the Portland community.

Features:

- Site is within the RLP's Area of Consideration
- Zoned for Medical Clinic use
- Conveniently accessed by major highways and downtown Portland
- Prominent site for VA branding

Site Design

Clarity of site circulation is paramount for the success of the building, mitigating visitor anxiety at arrival and departure. The main public entrance to the CBOC is located on West Commercial Street. The entrance is made prominent by elevated architectural masses on corresponding corners of the Clinic and parking structure. A canopy is provided at the CBOC's entrance with space for three cars to drop-off and pickup. A 10-seat gathering plaza is located adjacent to the entrance to allow family and patients a chance to spend time outside the CBOC in good weather. The entrance to the patient garage is immediately to the east, directly

The Gateway Rendering

off the entrance drive. The garage pedestrian entrance is across from the CBOC's main entrance with a well-marked, raised cross walk between them.

Staff parking is located on the west side of the Center and contains 150 spaces with its own entrance from West Commercial Street. A Staff building entrance is located adjacent to the staff parking. Both the main and staff entrances are separated from drive lanes by site bollards. Service vehicles enter at the east end of the site (behind the garage) and are restricted to the drive lane behind the garage and CBOC. The ambulance dock, mobile imaging station, dumpsters and loading dock are located behind the Clinic, out of site from patients and visitors. The CBOC and garage are located close to the street to limit the need for cutting into the steep hill behind and control site costs. Service vehicles will exit the site onto West Commercial at the west end of the staff parking. Patient and service traffic are designed to avoid crossing each other on the site. To avoid extensive and intrusive cutting into the hill at the back of the site, a short retaining wall has been introduced at the front of the site to raise the ground floor of the development. At its highest, the site wall will stand 6'-0" tall, with a communicating site stair to aid in ease of access. The main entrance will remain ADA compliant from the street, and the staff entry will be ADA compliant from the staff parking area. Covered entries are provided at the mobile imaging pad, ambulance entry and loading dock. The CBOC's main entrance is over 1000' from the nearest main intersection (West Commercial Street and Beach Street).

Features:

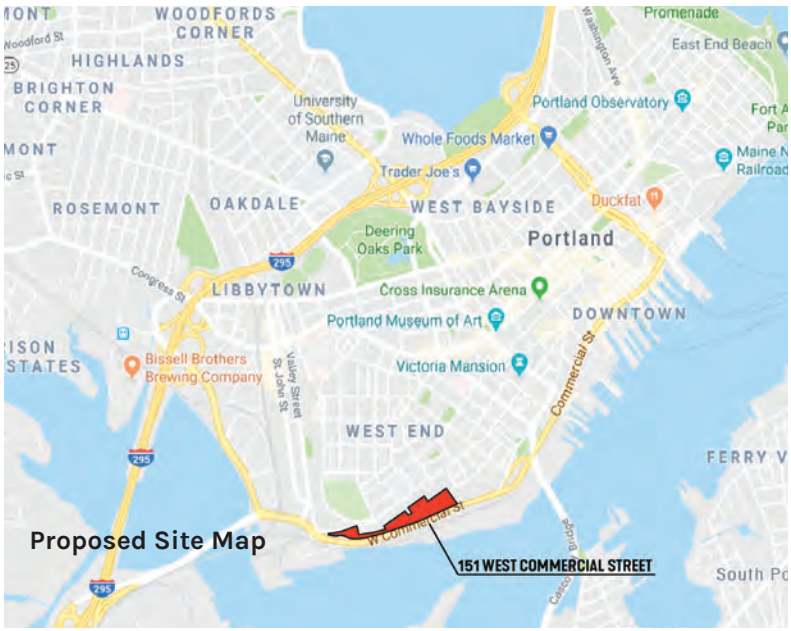
- Prominent site entrance with segregated traffic patterns
- Covered patient parking adjacent to the CBOC
- Separate staff parking and entrance
- Discreetly located building service area

Building Design

Portland, Maine, while extremely rich with history and tradition, also celebrates innovation, with a strong commitment to art and design. This modern quality building reimagines traditional material compositions with contemporary design principles, balancing notions of permanence and progress. Having completed many projects with the VA, SmithGroup understands the mission of the VA's Patient Aligned Care Team principles. Not only must the care be patient-centered, but the design of the facility must be patient-centered, as well. SmithGroup prides itself on being at the forefront of healthcare design, and Portland's CBOC will be no exception.

Concept

The primary concept for the buildings aims at creating a gateway through which patients and visitors enter the site, offering a clear means of access from West Commercial Street. This is achieved by raising the public lobbies and vertical circulation in the front corners of the clinic and parking structure as a welcoming beacon. We then extended activated the public-facing facades along West Commercial to take advantage of views to the Fore River and to create a positive environment for patients, family, and passerby. High glazing in the clinic is implemented to bring natural light into public zones, and to reach deep down into clinical corridors to enrich the caregiver experience.



The corners of the gateway are designed with glass, not only to offer intelligibility to the users, but also to honor our veterans through the use of patriotic super-graphics on the backdrop of each space. The building communicates appreciation for the sacrifice of our service members, as well as give them a respectful welcome at the front door. This motif is carried through the materiality of the building with a dual meaning for each material, one which speaks to the character of those for which the building serves, and the other to reference the local vernacular. Corrugated metal represents the unwavering strength of our service members and speaks to industrial military hangars and barracks, as well as referencing Portland's waterfront industry and shipping containers. In the same spirit, a randomized color variation in the brick represents the diverse cultural backgrounds of our veterans, while also nodding to Portland's traditional New England red brick. On the rear elevation, out of public view, a more cost-effective concrete masonry unit veneer is used, with colors selected to match the brick.

Building Components

The Clinic is broken up into two major components: the frontage, which celebrates public and multi-purpose functions, and the clinical box, designed for efficient team-based care. The building design climbs two stories with rooftop mechanical units, screened with a similar corrugated metal as the street-facing façade, only perforated for proper air intake.

Proposed Site Map

MATERIAL PRECEDENT

- PORTLAND:
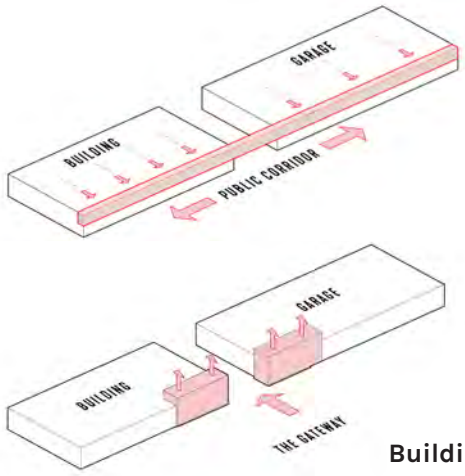
  - WATERFRONT INDUSTRY & SHIPPING CONTAINERS



Waterfront View from The Gateway

The building envelope is designed to respond to the challenges of the local climate. Walls are designed to prevent moisture penetration and minimize heat loss and gain throughout the year. Exterior steel and metals are coated or galvanized to prevent corrosion, and the building envelope will minimize air leakage to and from occupied spaces and ensure condensation control with a continuous weather barrier. The brick, composite metal panel, and corrugated metal panel systems will layer onto 3" mineral wool rigid insulation, air vapor barrier, exterior sheathing, and 8" cold-formed metal framing.

All window glazing shall be low-E, insulated glass Storefront doors shall be low-E, insulated and tinted. Window systems shall be double glazed and provided with a continuous thermal break between inner and outer sash. Windows in the clinical areas have been appropriately sized to allow in natural light and afford privacy to patients and staff. Frames shall be thermally broken. Windows in the security exam or holding rooms will be 7/16" thick laminated glass. The laminated glass will be placed on the interior of double-glazed windows.

The roof system will be designed according to the recommendations of the National Roofing Contractors Association (NRCA) Roofing and Waterproofing Manual. Low slope roof systems will be designed per FM global criteria, to local environmental conditions, utilizing sloped structural system. Roofing membrane system will be a layering of black EPDM roofing, coverboard, 4" of rigid insulation, vapor barrier, on metal decking. Roof walkways will be made of prefabricated roof walk pad with nonslip surfaces, on access routes to mechanical equipment that requires recurrent maintenance. Roof ladders, stair and platforms will be provided as necessary to ensure the safety of maintenance workers.

Insulated galvanized metal doors or aluminum storefront doors will be provided, as appropriate. All doors will be a minimum of 3 feet wide in non-patient areas, and 3 feet 6 inches in patient areas. The main entrance doors will be automatic sliding doors of anodized aluminum construction with safety glazing. They will comply with the same energy efficiency requirements as the window systems.

Building Diagrams

Southfacing Exterior Night Rendering

At the main entrance, staff entrance, ambulance entrance, loading dock, and mobile imaging entrance, vestibules will provide an airlock. Other swinging exterior doors will be heavy duty, insulated, full-flush hollow steel construction. All exterior doors will be weather-stripped, self-closing, and outward opening. Latch guards and hinges with non-removable pins will deter tampering or unauthorized entry. Exterior details will be designed to preempt bird roosting. Exterior structures that will be included in the overall campus design scheme include:

- Covered vehicle drop-off area at the main building entrance
- Staff-entry canopy
- Ambulance drop-off and canopy
- Mobile imaging pad and canopy
- Covered loading dock area

All covered walkways and service overhangs will be constructed of non-combustible materials and are integrated into the architectural style of the building. Walkways will be illuminated with integrated fixtures controlled by the site lighting system. Where required by the AHJ, walkways and overhangs will be fully sprinklered.

Any service and equipment yards will be blocked from public view by screen walls that are architecturally compatible with the main building.

The facility is designed to meet Federal and Local requirements for fire safety, physical security, accessibility, seismic, and sustainability standards per the terms of the solicitation for proposals and will be fully compatible with the VA's intended use.

Features:

- Modern quality building with durable exterior materials
- Articulated building elements for pleasing aesthetics and patient way finding
- Covered and protected entrances
- Weather resistant and energy efficient envelope

West Facade Rendering

Planning & Tenant Improvement

The VA space program in the Request for Lease Proposal is located on two floors in the CBOC. The program spaces have been laid-out in the test fit plans with an emphasis on efficient and understandable layouts. Specialty clinics such as dental, eye, audiology and mental health are located on the first level for ease of access, and the larger Patient Aligned Care Team (PACT) spaces are are grouped on the second level, with easy access through elevators and stair. There is a grouping of one freight/stretcher elevator and one passenger elevator, located near the primary check-in and wating spaces on the first floor. Floor plans are designed to be easily understandable, with clear cues to draw the users to key checkpoints. All corridors are 6 feet in width. Security measures, as outlined in Appendix C, will be included. Exterior windows are provided at the end of major circulation corridors for natural light and connection to the exterior. Appropriate finishes and materials will be used in patient, staff, and public spaces to conform with the TI budget and medical office building character of the building. Minimum 9'-0" high ceilings will be provided throughout with 10' ceilings in larger spaces (>500SF).

Features:

- Patient-centered design focused around team-based care
- Efficient layouts for state-of-the-art treatment
- Clear and consistent patient waiting and circulation patterns with abundant natural light
- Separation of open patient and secured staff circulation

Subject: Application for Level III Site Plan Application
FDS JBB Portland LLC
Proposed VA Community Based Outpatient Clinic (CBOC)
113 West Commercial Street

Dear Christine:

On behalf of **FDS JBB Portland LLC** (Applicant), our office is pleased to provide the uploaded submission materials for a Level III Site Plan Application. This submission package is intended to meet the City's Level III Site Plan Submission requirements as outlined in the Level III Site Plan Checklist as well as Section 14-526 of the Code of Ordinances.

PROJECT OVERVIEW

The applicant is proposing to develop a 62,300± SF Veterans Administration Clinic and supporting parking garage under a long-term lease agreement with the Department of Veterans Affairs. Site construction is scheduled to begin in early 2020, pending City Site Plan approval with building permits from now through late winter. The front area of the site to be developed is currently in the B-5b Zoning District and the Waterfront TIF District. The site is identified in the City's Assessors Tax Map 060/Block A001/Lot 001. The lot area is 8.4 acres of undeveloped land, although the site did contain a rail yard many years ago.

The current development plan includes the following uses and design elements:

- A new two-story Clinic building with a footprint of approximately 34,155± SF and a total GLA of approximately 62,300 SF. The Clinic will contain on the first floor, patient care services and administration while the second floor will include specialty clinics such as dental, eye, audiology and mental health. The building will contain a single loading dock for truck deliveries as well as outside space for the parking of a mobile imaging trailer. A loading area for ambulances will also be located at the rear of the building. The building will contain a full fire suppression system along with typical utilities for water, sanitary, underground power, and natural gas. Patient/Visitor entry will be focused to the east end of the building and staff entry will be on the west end of the building. The building positioning locates the front entry tower closest to the West Commercial Street right of way line at less than 10', which is consistent with the B-5b dimensional requirements. The proposed building is expected to provide a prominent base as a gateway into the City as well as communicating the VA's brand to the local public and visitors to the city alike. At a two-story height (max at 43'-0"), the building will also fall well within the scale of nearby structures and it will result in insignificant visual impact to the residential neighborhoods to the north (off Danforth Street) that are substantially higher in elevation than the development site.

- A 382-space precast parking garage will be positioned on the east end of the property. Similar to the Clinic building, the garage elevator tower will anchor the building to the street front, as it too, is positioned within the maximum 10' setback from the right of way. The garage will contain 250 dedicated spaces to VA Clinic patients/visitors and 132 spaces for open parking available to the nearby Star Match Building, also owned by J.B. Brown & Sons. The owner will be discussing opportunities with City officials for the use of the garage as a storm event overflow parking facility and related use. Initially, parking in the garage will be reserved specifically for VA use (lower two floors) while the surplus parking on the upper deck will be for ancillary and J.B. Brown use. The owner reserves the right to install gate controls for portions or all of the garage in the future to allow for greater public use (either short term "pay for" parking or long-term business parking leases).

- The main project driveway entrance will be located between the two buildings, thus allowing for patient drop off/pick up and garage parking access from the same driveway. The main driveway will contain a single entering lane and two exiting lanes. Secondary driveways will be provided at the west end of the site for access to the Staff parking lot and on the easterly end of the site for access to the parking garage and for service access around the rear perimeter of the site. All driveways are located to provide separation from the existing driveways on the opposite side of West Commercial Street that serve the Canal Landing site. Currently it is believed that the driveways will not require signalization, however improvements to West Commercial Street to provide left turn lanes into each driveway are likely to be required. A traffic impact study is being completed and the project will require a Traffic Movement Permit thru the City under your delegated authority.

- A 10' wide paved pathway is proposed along the site frontage, which is consistent with the City's *West Commercial Street Multi-Modal Plan*. The pathway will provide connectivity to improvements the City is pursuing both east and west of the site for providing pathway linkage between existing trail systems along the waterfront. The project is located within the Waterfront TIF District and it is understood that TIF funds will be used to support the pathway development. The pathway construction will require improvements to existing utilities including the CMP power pole locations and the existing Fore River Interceptor Sewer appurtenances that are located along the pathway alignment. A retaining wall will also be required along the back side of the pathway, to overcome the topography along the street frontage.

- Accessory uses, including but not limited to, the surface parking facilities, utility services, stormwater management systems, and site amenities are also part of the current proposal. A new staff parking lot containing 150 parking spaces will be provided on the west end of the site. The site design will employ the use of porous pavement in the surface parking lot to address both flood control and water quality treatment compliance.

CLOSURE

As outlined in the Level III Site Plan submission requirements and checklist, we will upload the following materials upon authorization by City staff:

- General Application Documents
    - Project Description
    - Level III Application Checklist
    - Right, Title and Interest
    - Zoning Assessment
    - Existing and/or Proposed Easements
    - Waiver Request and Waiver Table

- Financial Capacity
- Technical Capability

- Transportation
  - Transportation Narrative
  - Traffic Assessment – (under separate cover and part of the Scoping meeting materials by Traffic Solutions)
- Environmental and Landscape Features
  - Narrative to Address Standards
- Environmental and Stormwater
  - Narrative to Address Standards
- Public Infrastructure and Safety
  - Narrative to Address Standards
- Site Design
  - Narrative to Address Standards
- Construction Management Plan – by Landry French Construction
- Site Plans and Architectural Plans

On behalf of **FDS JBB Portland LLC**, we look forward to your continued assistance on the project and we look forward to the next available workshop meeting with the Planning Board. As is required, once we complete the Planning Board workshop, the applicant will be conducting a Neighborhood Meeting. We anticipate this meeting will be conducted prior to the Public Hearing.

If you have any questions regarding the materials being submitted, please contact this office.

Sincerely,

GORRILL-PALMER

CONSTRUCTION MANAGEMENT PLAN

A Construction Management Plan has been prepared by Landry French Construction and is appended to this section.

Construction Management Plan
For 133 West Commercial Street
Landry/French Construction

This document and its subsequent attachments comprise the Construction Management Plan being submitted to the City of Portland for the new Veteran's Affairs Community Based Outpatient Clinic (CBOC) and associated Parking Structure to be constructed at 133 West Commercial Street. This plan is being submitted by Landry/French Construction on behalf of the Owner. The Construction Management plan contains information pertaining to the overall planning and coordination of the project.

A. Construction Management Principles

The impact of this project during construction will be minimized via the following management practices and principals:

- As articulated on the attached plan (Exhibit A), the Construction Zone will be secured with a combination of jersey barriers, fencing and gates along West Commercial Street and tie-in into the natural barrier at the North side of the project site. These barriers will look to prevent any access into the site from public.
- All Construction activities will be performed within the limits of the site fence to ensure public is never exposed to any risks caused by construction activities. Three entrances will be maintained into and out of the site and will correspond with the final permanent entrances that are depicted on the site plan.
- All deliveries will be scheduled and coordinated to ensure there is minimal off-site queuing required.
- All construction activities will occur within the sound ordinance times.

B. Development Review of Construction Management Plan

Landry/French has developed a comprehensive management plan that will be in place for the duration of the construction timeline (or until permanent/final measures are installed and can be utilized). Again these are depicted on Exhibit A.

Note that Landry/French utilizes a site-specific safety policy for all workers on-site. Each member will complete a job specific safety orientation prior to starting work activities. At no point will the public have access to the project site within the fenced limits.

C. Performance Guarantees, Inspection Fees, Preconstruction Meeting, and Permits

All fees, building permit fee and guarantees will be paid/issued prior to the commencement of construction. All street opening permits will be applied for by the selected site contractor upon award and in hand prior to opening the street for work.

There is no blasting anticipated for this project.

D. Construction Administration and Communication

The contact person for all construction activities for the project will be:

Landry/French Construction
(207) 730-5566
gmitchell@landryfrench.com

Signage will be posted onsite with additional emergency contact information for the selected Superintendent that will be the site contact for the project. An Emergency Call Log will be developed and distributed to the project team (to include subcontractors).

E. Construction Schedule

The Project is expected to commence immediately upon permit issuance (Spring 2020) and be completed no more than 18 months post commencement of work.
All construction activities will adhere to the City of Portland's Noise Ordinances and their applicable timeframes. All deliveries for this project are anticipated to occur during normal working hours (7:00A – 3:30P).

F. Security & Public Safety

Please refer to Exhibit A for the site fencing/gates, traffic and pedestrian routing plan, which will be utilized for the duration of the project. If required by the City, Knox Box Pad Locks will be installed at each gate for fire department emergency access, ensuring that access is always maintained to the Fire Hydrant along the property frontage.

The fire safety program on-site will consist of the following:

- Fire Extinguishers placed throughout the construction site for the duration of the project.
- All employees on-site will be orientated to the site-specific plan that will include an emergency evacuation plan.

G. Construction Permitting and Traffic Control Plans

Temporary barriers will encroach into the Commercial Street ROW but will always ensure that current traffic and pedestrian patterns are maintained.

This project includes new utilities; that will require new taps/tie-ins within the public ROW. All street opening permits will be applied for and approved prior to start of utility work in the street.

H. Site Management and Controls

Landry/French will adopt the following site management and maintenance activities through the duration of the project:

- Trash and Debris will be contained within the project fencing and changed out on a regular basis.
- Street cleaning will not be required on a regular basis but reviewed on a daily basis and cleaned as required to remove dirt/debris caused by the construction efforts. A stabilized temporary construction entrance will be installed at the gate locations and maintained by the selected sitework contractor.
- Noise will comply with City Ordinances.
- If needed, water will be used to control dust during the sitework activities of the project. We do not anticipate any other activities that will require dust control measures.
- Onsite snow removal will be handled by Landry/French.

I. Erosion Control and Preservation of Trees

We will comply with the approved erosion and sedimentation control plan.

J. Construction Staging Area

Exhibit A of this document is the site logistics plan for the project.

K. Parking During Construction

On-site parking is expected to be utilized. However, if off-site parking is required, employee parking will be provided by employers utilizing legal parking methods.

L. Special Measures as Necessary

As it is understood currently, no Special Measures will be required.

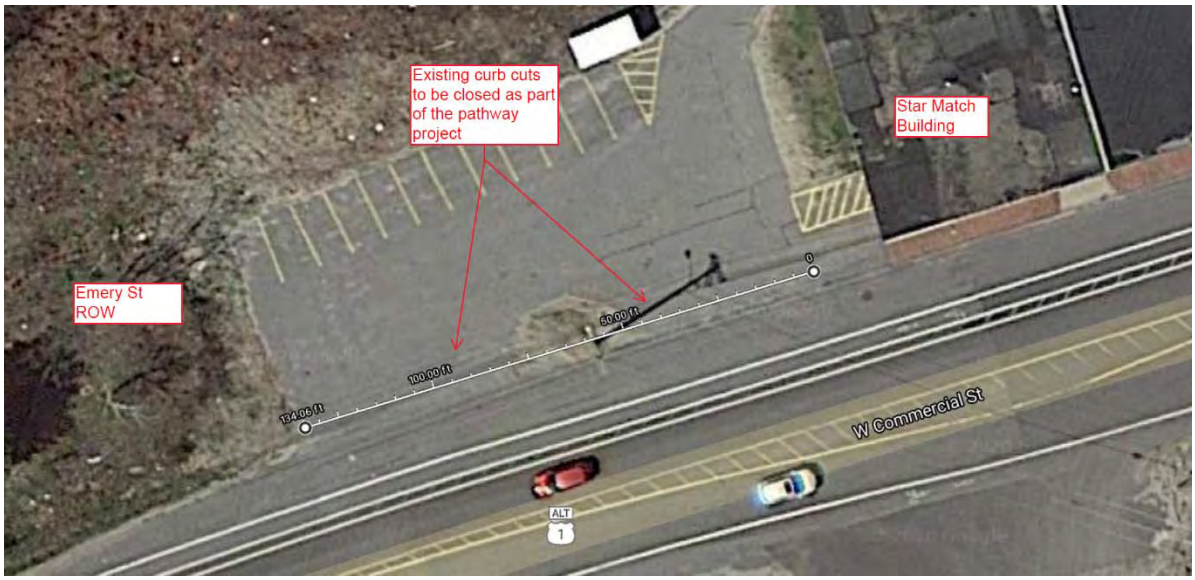
Letter of Response #1

Dear Andrew:

On behalf of **FDS JBB Portland LLC** (Applicant), our office is pleased to provide the following responses to various staff comments you provided on January 3, 2020. For ease of review we have repeated the staff comments and provide our responses as follows:

MIKE TREMBLAY, DPW P.E. SENIOR ENGINEER



Site Plan

Comment

The project site has three driveways. A maximum of two driveways is permitted per the technical manual (1.7.2.8). A waiver is required for three driveways. DPW does not support a waiver for a third driveway at this time, given the potential issues with the central driveway, discussed below; three driveways also present three new conflict points along a high-volume, high-speed roadway.

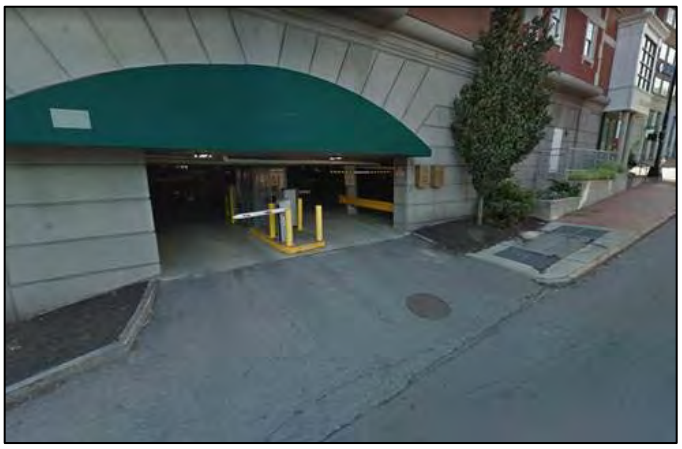
Response

The applicant is proposing three driveways; however, we note that the most easterly driveway is positioned within the Emery Street Right-of Way, thus it could be considered as separate from the other two driveways from the site onto West Commercial Street. We also note that J.B. Brown & Sons owns the adjacent property containing the Star Match Building, just east of the Emery Street Right-of Way. J.B. Brown has committed to closing their existing curb opening just to the east of the Emery Street Right of Way as part of the development of the City sponsored 10' wide mixed-use pathway project. This curb cut measures over 135 feet wide. That small paved parking lot will simply be tied into the Emery Street Driveway.

The net result will be only two new driveways along the West Commercial Street frontage, a distance of over 1,500 LF. By basis of comparison, we note that the development site is within the B-5b Zone where there is no minimum lot size or minimum frontage, thereby, an alternative development scenario consisting of multiple lots could arrive at substantially more driveway openings on West Commercial Street. We note that the driveways provide distinct access for the development as follows:

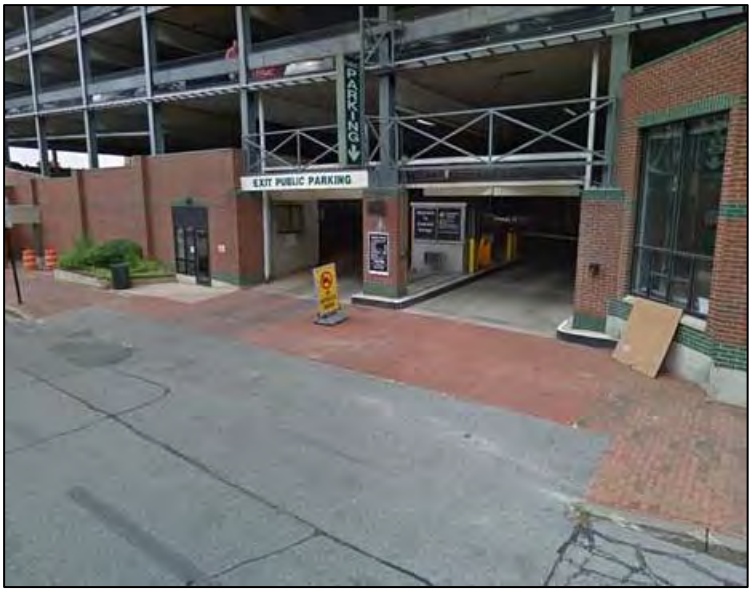
- The westerly driveway will primarily serve Clinic staff for access to their surface parking lot. The westerly driveway will also provide access for heavy vehicles including the solid waste hauler, large truck deliveries exiting the site and ambulance services.
- The central driveway is the primary site entrance for patients/visitors and it provides direct access to the main Clinic patient building entrance as well as to the parking garage.
- The easterly driveway will provide access to the parking garage as well as for a heavy vehicle entering circulation route around the rear of the site, which is particularly necessary for access to the loading dock. The easterly driveway within the Emery Street Right of Way will also serve for a linkage to the Star Match Building parking lot and it will allow two existing curb openings to be closed.

Comment



The central driveway, used for pick-up/drop-off and as a garage entrance, is problematic. There appears to be very little stacking space for vehicles if the three pickup/dropoff stalls are occupied, which may cause vehicles to spill into West Commercial Street. Additionally, as all patients and visitors using the garage must walk across this driveway, vehicles turning into the driveway may need to wait for pedestrians to cross at two different locations (the shared path and the crosswalk within the site), which may cause conflicts on West Commercial Street. DPW suggests that the central driveway be closed, and the pick-up/drop-off area made accessible solely from the 24-foot access drive behind the site. This gives vehicles ample space to queue for the pick-up/drop-off area if there is congestion in this area; the driver can then quickly enter the garage or exit via the access drive. The path would be continuous between the garage and clinic, with no vehicle conflicts, and no waiver for an additional driveway would be required. Some of the following comments may be addressed, or become moot, if this comment is incorporated.

Response:



We are not in agreement with the assessment of stacking space as well as the interaction of entering movement traffic and pedestrians crossing between the buildings and/or the mixed-use pathway. Much like many private driveways and urban property access settings there will be the need for entering and exiting vehicles to give way to pedestrians on sidewalks, etc. This is certainly true on the Peninsula, where, for example, at multiple parking garage entrances there is limited queuing capacity at a gate-controlled entrance. Take for example, entrances at the following:

Fore Street

Union Street

High Street Garage

In addition, we note that we are currently evaluating the implementation of either a two-way center left turn lane or dedicated left turn lanes within West Commercial Street, at each of the development driveways. This evaluation is made part of the Traffic Study currently underway by Traffic Solutions and which will be submitted

as part of the Traffic Movement Permit Application to the City. These lanes will provide storage capacity for left turning vehicles into the site, while also minimizing interruption to the thru-traffic movements along the street. Secondly, the available queue of vehicles within the site will be approximately 120' from the crosswalk between the buildings to the first 5-minute drop-off/pick-up parking stall adjacent the clinic. This storage space will provide adequate stacking while also providing an opportunity for vehicles to enter the parking garage, or, if necessary, to circumnavigate the site perimeter via the rear access drive.

Comment

All of the site driveways are wider than permitted by the technical manual (1.7.2.4). Driveways wider than 30 feet, measured at the property line, require a waiver. The western driveway measures about 35 feet at the property line; the central driveway measures about 41 feet, and the easternmost driveway measures about 34 feet wide. At the outer driveways, these widths reflect large curb radii, including a 40 foot curb radius at the western side of the western driveway. At the central driveway, the entering travel lane is 14 feet wide and the exiting right-turn lane is 13 feet wide; both of these widths seem excessive. Vehicle turning templates are requested to confirm that these driveway widths and curb radii are necessary. The Applicant should tighten dimensions where possible, and provide explanation for wider dimensions otherwise.

Response:

The accompanying diagrams show the movement of semitrailer trucks or an emergency vehicle entering/exiting the site. Each of the driveways have been designed to provide adequate maneuvering space for the semi-trailers or a fire truck. The site will be routinely visited by Mobile Imaging trailers (WB-63 equivalent) and also larger tractor trailer deliveries for materials to the Clinic. The latest plans have been updated to reduce the driveway widths as much as possible while also providing adequate curb radii for the assortment of vehicles expected to visit the site, including passenger vehicles up to heavy semitrailer trucks. These are summarized as follows:

- Westerly driveway – 30' wide with 25' radius each side;
- Central Driveway – One 14' wide entering lane; two exiting lanes at 13' for right turns and 11' for left turns. Curb radii will be 20'; and
- Easterly Driveway – 24' wide with 20' exiting radius and 25' entering radius.

Comment

The 24-foot access drive seems excessive for one-way traffic, even for heavy vehicles. Reducing this width would reduce impervious surface and potentially reduce the amount of regrading that is required behind the site. Alternately, this access drive could be utilized by staff and/or patients and visitors in order to be able to remove one of the site driveways, as discussed above.

Response:

The rear access drive behind the garage will be 20' wide to accommodate occasional larger truck access as well as emergency services vehicles. The drive aisle behind the Clinic will be 24' wide as it is a two-way directional drive that must accommodate semitrailer mobile imaging vehicles, emergency vehicles including ambulance service to the rear of the building, and general large trailer truck deliveries to the site.

Comment

The central driveway features a raised crosswalk; however, curb ramps are shown serving this crosswalk. These ramps may not be necessary if the crosswalk is fully raised.

Response:

The design of the raised sidewalk has been updated to reflect the differential height between the raised crosswalk which is 4" high and the sidewalks which are raised 6". There will be a slight ramp condition at the transition from the crosswalk to each sidewalk, but not a full-fledged ramp given the small differential in grade.

Comment:

The alignment of the intersection of the driveway serving the pickup/dropoff area with West Commercial Street is not acceptable. A crosswalk must be shown, the stop bar must be behind the pedestrian crossing area, and the median shall not intrude into the pedestrian crossing area. Additionally, a larger raised table, which begins at a sloped driveway apron at the site entrance, and continuing through the internal crosswalk, should be considered.

Response:

The latest site plans include updates to the pathway crossing at each of the driveways. These include crosswalk pavement markings and stop bars positioned behind the crosswalk markings.

Comment

The surface parking area includes a significant amount of landscaped islands. These islands would appear to potentially cause drainage issues, and will be an obstacle to snow clearance. The allocation of green space within the parking lot should be reconsidered.

Response:

The design includes the use of porous pavement over much of the parking lot area, thus there is not as much concern about drainage patterns and the interruption of sheet flow on the pavement that might be caused by the landscaped islands. We are aware of the impact to winter snow plowing operations caused by the islands; however, the ability to provide screening and shading effects to the parking lot are considered a net positive outcome in this proposed design. The landscape plan for the parking lot includes plantings in the island bump outs as well as a line of trees along the site frontage, all of which are intended to offset the inability to place street trees within the proposed esplanade, due to the underlying utilities in the esplanade. There will be an 8' wide divider island between the two parking bays and that island is intended as a sidewalk condition to allow the employees to walk to/from the building without need of walking in the drive aisles. This condition is improved by the placement of the planted bump out islands, rather than placing trees within the longitudinal divider island, in our opinion.

Comment

One small area for snow storage was identified near the entrance to the surface parking lot. Additional areas should be identified, as the surface parking area is 45,000+ SF.

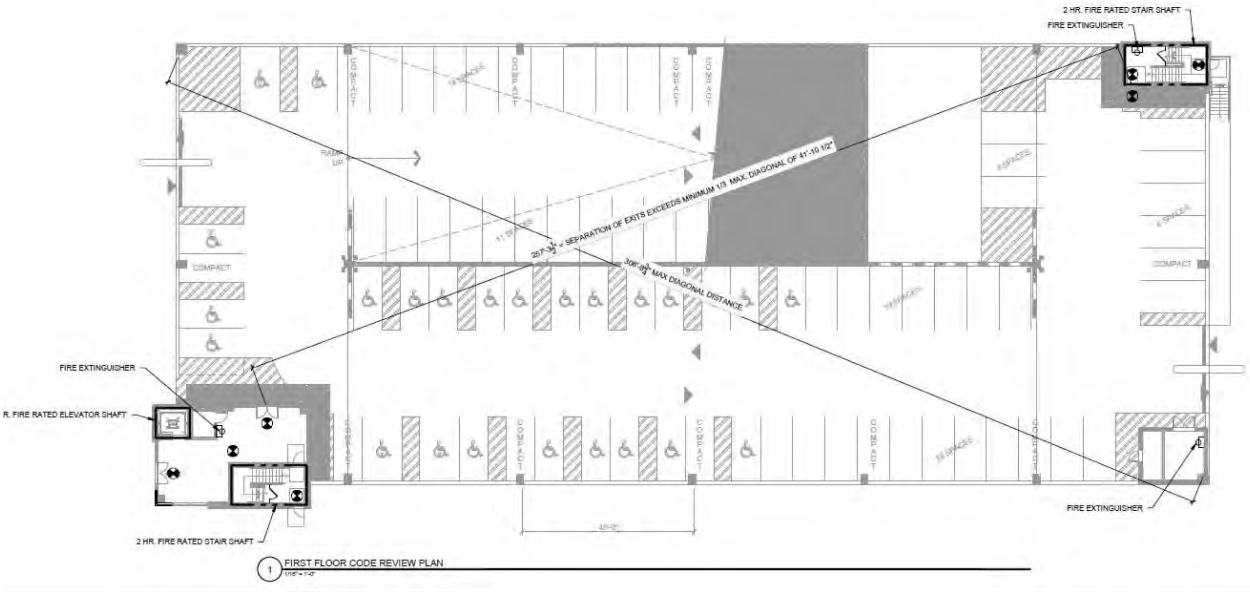
Response:

Several areas of snow storage have been identified on the site plan around the site perimeter. Removal of snow from the site may be occasionally required and the owner will contract with a local snow hauler to deal with high snowfall conditions, on an as needed basis.

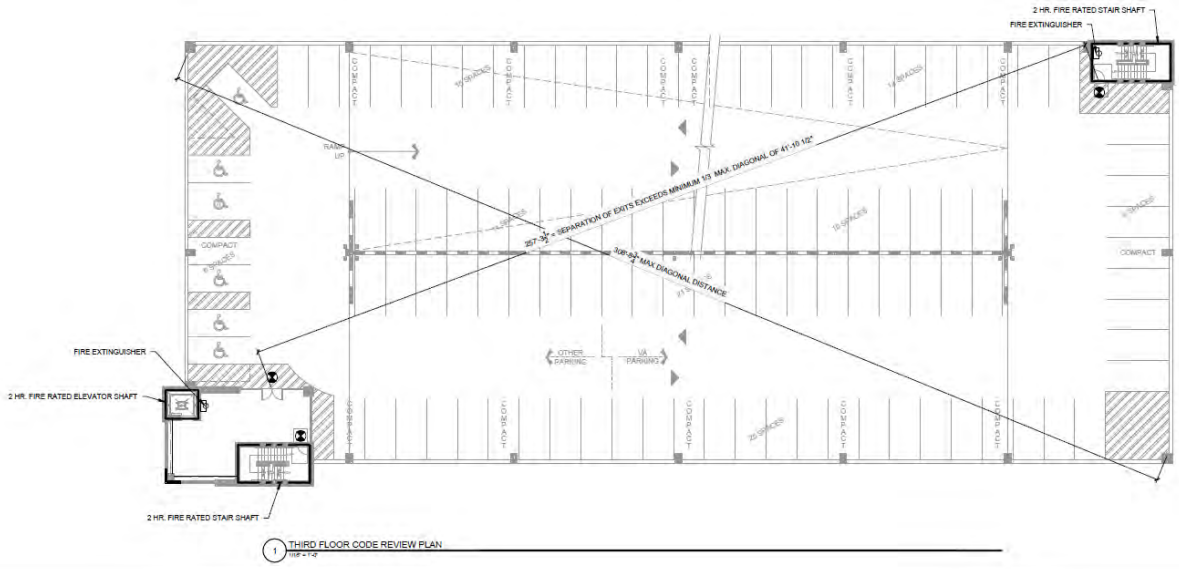
Comment

The location of the dumpsters and dumpster access driveway should be reconsidered. Garbage trucks would appear to have to make awkward turning movements to service these dumpsters, and the dumpster area necessitates a significant amount of regrading on an embankment that may otherwise be untouched by the project. The dumpsters are also located somewhat far from the clinic.

Response:



The solid waste enclosure has been shifted to a position closer to the loading dock area at the westerly rear corner of the Clinic. This location will provide improved access for staff as well as the trash removal equipment.



Comment

The parking layout of the parking garage should be provided. Per ADA parking requirements, "Hospital outpatient facilities need 10% of patient/visitor spaces to be accessible." As such, at least 39 accessible parking spaces in the garage are required to be accessible. Of these 39 spaces, 7 are required to be van-accessible.

Response:

The Government has requested 250 parking spaces out of the garage, thus the ADA count for the Clinic in the garage will be 25 spaces. The remaining 132± parking spaces in the garage will include 6 ADA spaces to satisfy the typical requirement for 1 ADA space/25 spaces. There will be a total of 31 ADA spaces in the garage. Updated interior garage layout is under preparation by Ryan Senatore Architecture and will be uploaded to ePlan when completed.

Comment

The 10-foot shared pathway must have a cross-slope of no more than 2.0% constructed. It is suggested that the pathway be designed to 1.5% cross-slope to allow for construction tolerance.

Response:

The pathway is currently depicted with a 1.5% or less cross-slope over its length.

Grading & Drainage

Comment

Spot grades are not provided on any of the grading and drainage plans. Spot grades should be included at critical grade break points, periodically along the front and back of sidewalk, at all grade break points at pedestrian ramps and tipdowns, at entrances and exits to buildings and garages, etc.

Response:

The latest grading and drainage plans include spot grading at critical points in the parking lot and around the site.

Comment

There is very little information on how the site will approach drainage. There is a significant slope at the back of the site which will contribute significant stormwater runoff to the impervious areas of the site. Surface parking lot drainage does not appear to be included. The drainage plan must be included in the site plan package for consideration before DPW will support this application.

Response:

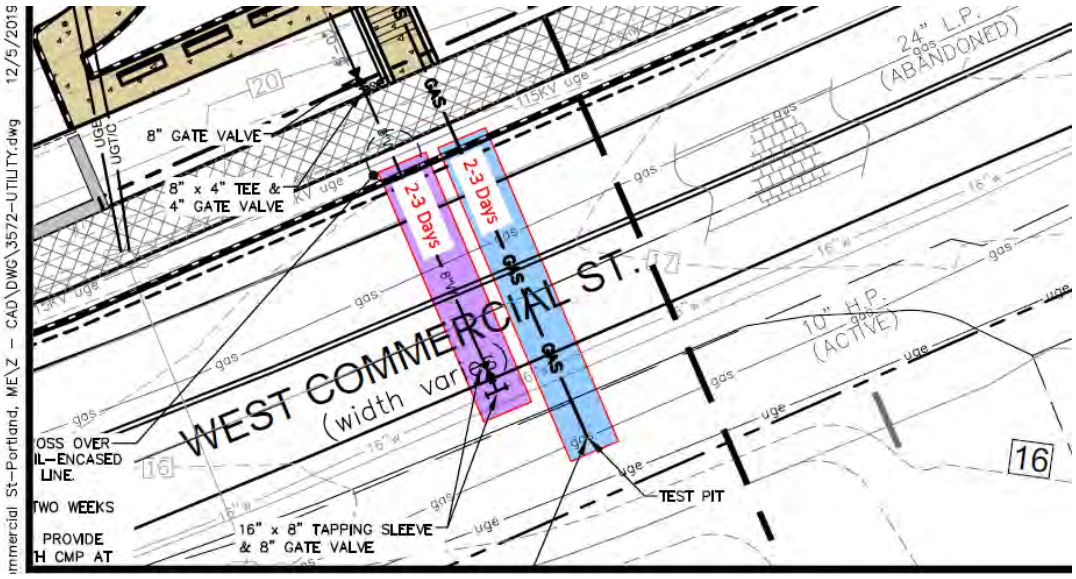
We have completed the grading and drainage plans and stormwater management plans, all of which have been uploaded to eplan for Staff and peer review. Key aspects of the design include:

- Porous Asphalt pavement in the staff parking lot will provide water quality treatment and quantity control storage.
- A subsurface sand filter with R-Tank® storage will be provided for water quality treatment of roof runoff.
- A Focal Point™ water quality treatment filter will be provided for a small area of the parking lot water quality treatment.
- A closed collection and conveyance pipe system will capture runoff from the undeveloped hillside and convey it to the existing street system.

Comment

This application proposes significant regrading at the back of the site. Slope stabilization and erosion control measures must be specified on the grading plan, in the details, and in writing. Slope stabilization shall be appropriate given the makeup of the soil in the embankments.

Response:



The Erosion and Sediment Control plan, narrative and details are part of the plan documents. Generally, the rear embankment slope will undergo a modest amount of regrading along the rear perimeter of the development. We have attempted to maintain these slope cuts to 2H:1V or shallower where possible although there are several areas at 1:1 for a short height. The Erosion control plans include the use of ArmorMax™ slope reinforcement on all slope steeper than 3:1.

Construction Management Plan

Comment

The locations of utility trenches and duration of work within West Commercial Street must be specified on the CM plan.

Response:

Landry French construction will be updating the CMP and an updated plan will be provided for staff review when completed. Each of the utility trenches in West Commercial Street is expected to require 2-3 days of effort. This includes the water services and the gas service extension. The existing paved road width exceeds 40' so the contractor is planning on maintaining two-way traffic throughout the duration of the work. They may also consider night work to minimize traffic control needs.

Comment

Gas service and water service would appear to require the diversion of West Commercial Street westbound traffic. The Applicant must provide a plan to accommodate traffic during this work.

Response:

The utility work in the street will require temporary traffic controls. Given the existing pavement width on the street at approximately 44', we believe there will be adequate area to allow for the maintenance of two-way traffic during the duration of work for the utility services. Similar circumstances have existed for other projects in the vicinity including the Canal Landing development and satisfactory measures for the maintenance of two-way traffic flow were able to be maintained. As a last resort the completion of the work during nighttime hours may be a possible alternative. The diversion of traffic may involve the use of temporary measures, including barrels, jersey barriers and the use of full-time traffic control personnel.

Comment

The Applicant states that current traffic and pedestrian patterns will be maintained; however, the CM plan shows a construction fence with Jersey barrier that would block the shoulder along West Commercial Street. This shoulder is used by pedestrians and bicyclists. The Applicant should clarify their proposed impact on the roadway, and include a pedestrian management plan if needed. Any construction site that forces pedestrians into vehicle traffic is not acceptable.

Response:

The intent will be not to disrupt pedestrian and bicyclist along West Commercial Street. The placement of any construction barriers will be performed to allow for continuation of two-way travel flow as well as pedestrians movements along the street. The Street has approximately 44' of paved width so we believe that the existing travel conditions should be maintainable while also achieving proper separation of the work zone from the traveling public for safety etc. The contractor will maintain the shoulder at all times except during utility trench work and they will place Jersey Barriers/fencing outside of the shoulder.

Comment

The Applicant should clarify the plan for contractor parking should on-site parking prove insufficient. No on-street parking along West Commercial Street is permitted.

Response:

It is understood that no parking on West Commercial Street will be allowed so the contractor will not use any on-street parking during the course of the work. There will be parking available either onsite or at the nearby Star Match building site.

Lauren Swett - Civil

Comment

In their online application, their numbers indicate that they are creating 3.6 acres of new impervious surface. Per the statute, Site Law applies to "structures" as follows: http://www.mainelegislature.org/legis/statutes/38/title38sec482.html
482. 6. B. "Buildings, parking lots, roads, paved areas, wharves or areas to be stripped or graded and not to be revegetated that cause a total project to occupy a ground area in excess of 3 acres. Stripped or graded areas that are not revegetated within a calendar year are included in calculating the 3-acre threshold." I do believe they will need to do a SLOD application, but it will be Delegated Review with the City.

Response:

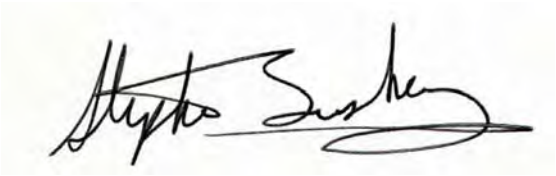
We agree that the project requires SLODA approval under the City's delegated authority.

Ben Pearson, P.E. DPW

Comment

It appears that the submitted Construction Management Plan does not include a dewatering plan. Likely used an older template than the current one (https://www.portlandmaine.gov/DocumentCenter/View/18030/General-Construction-Management- Template). If this plan moves forward, a dewatering plan is required. It is likely that they will need to pump groundwater from the site during construction and we want to know what their plans are.

Response:



Based on the findings of the geotechnical investigations groundwater is not expected to be encountered during the performance of work. The Erosion Control plan contains a note regarding dewatering, if required, restricting

all dewatering effluent to be managed and discharged onsite or thru the use of a frac tank. No dewatering effluent will be allowed to be discharged to the City systems.

If you have any questions regarding the materials being submitted, please contact this office.

Sincerely,

GORRILL-PALMER

12.0 Introduction

FDS JBB Portland LLC is proposing to construct a Community Based Outpatient Clinic within a portion of property located at 113 West Commercial Street in Portland, ME. The facility will serve as a VA Outpatient Clinic and will be referred to in this report as the "VA Clinic". The property being developed is approximately 8.40 acres. The development will consist of the following:

- A 34,155 SF footprint, two-story outpatient facility (total GLA = 62,300 SF); and
- A 35,880 SF footprint, multi-level parking structure for 382 spaces, with a 150 space, surface parking lot.

The purpose of this analysis and report is to document what measures will be implemented to provide stormwater management for the project, what is required to control the peak rate of discharge during large storm events, and to provide treatment to stormwater runoff as determined by MaineDEP's Chapter 500 Rules and City of Portland Technical Standards for Stormwater Management. Both the impact on peak rates of runoff and water quality measures are considered in this evaluation.

Erosion and Sedimentation Controls (Basic Standards) will be employed during the construction of this project and are summarized in the Erosion and Sedimentation Control Plans provided on Sheets C-5.3, C-10.5, and C-10.6.

12.1 Existing Site Conditions

The project site is bounded to the south by West Commercial Street/U.S. Route 1A; to the east by the Star Match Building site and undeveloped Emery Street Right of Way; to the north by the West End residential neighborhood on Danforth Street; and to the west by undeveloped land and a currently vacant Restaurant site (formerly Bennie's Clam Shack). The property has approximately 1395'± of frontage on West Commercial Street and is directly across the street from the Portland Yacht Services/Canal Landing property that is on the Fore River. The property was once the site of the rail yard for the historic Portland Star Match Building which was built in 1870[1]. Up to as many as nine rail spurs operated on the site at least to the early 1900's, with continued use of the tracks and yard for the storage of iron and steel occurring thru the late 1960's. Today, one disconnected rail spur is still present and various remnant railroad ties are visible on the ground surface across the site. The site today is mostly characterized by tall grasses and brush on the south side with thinly wooded area and brush on the northern side of the site.

West Commercial Street is a major artery into the Portland peninsula and Old Port District. It also contains major utilities that service the surrounding area. These include a 115 kV underground electric transmission line, 3-phase overhead electric and communications facilities, and the 48" Fore River Interceptor sanitary sewer line that runs along the property frontage. A 10" high-pressure natural gas main and 16" Portland Water District water main are also located in West Commercial Street, but are not located directly along the property frontage. A 36" combined sewer line, that serves the West End neighborhood, flows through the Emery Street Right of Way from North to South and connects to a diversion structure on the south side of West Commercial Street. These utilities are identified on the Existing Conditions and Removals Plan, Sheet C-3.0.

[1] See Phase 1 Environmental Site Assessment by S.W. Cole dated September 3, 2019.

Topography on the site generally slopes from north to south, towards West Commercial Street and, ultimately, the Fore River. The northern portion of the site is characterized by an approximately 75' embankment with naturally vegetated steep slopes (2H:1V) or greater in most areas. At the toe of the existing slope, the site levels off and has shallow slopes ranging from 1% to 2% from north to south. The distance from the toe of slope to the south property line is approximately 150' in most areas and decreases in both the east and west ends of the site. The flatter portions of the site will be the primary area of development. Runoff emanating from the site generally sheet flows from north to south across the old rail yard towards West Commercial Street, as the grade from east to west stays fairly constant.

West Commercial Street has a vertical sag curve in front of the property that is centered approximately 550'± east of the south-west property corner. The low point in the street is at roughly elevation 15' (NGVD29). An existing catch basin that collects runoff from the road and site is located along the north gutter line in the roadway sag. Water flows to this catch basin from the east at a high point in the road near the south-east property corner and from the west starting at a catch basin located in the gutter line approximately 400'± westerly. Although the grade along the road is 1% to 2%, this amounts to a change in grade of approximately 8'± from the sag curve to the high point at the southeast property corner. The grade across the site is relatively flat from the high point at the southeast corner and stays constant across the site at around elevation 21' to 23' (NGVD29) as the road trends downwards. Therefore, the developable site area is approximately 8'± above the grade at the sag in the road at the maximum. There is no curb along this portion of West Commercial Street, but a grassed slope extends from the edge of pavement up to the flatter area of the site. This change in grade transitions from relatively flat to steep (2:1±) in the area of the catch basin and roadway sag.

The USDA NRCS Medium Intensity Soil Survey identifies the site soils to be comprised of the following:

Table 1
USDA Soils

Soil Type	Soil Description	Hydrologic Group
Cut and Fill Land	Silt Loam, 3 to 8 percent slopes	N/A
Hinckley	Loamy Sand, 3 to 8 percent slopes	A
Hinckley	Loamy Sand, 15 to 25 percent slopes	A

The majority of the development is located on cut and fill land, which is considered to have low susceptibility to erosion and is somewhat moderately well drained. According to the Environmental Site Assessment investigation and geotechnical investigation[2] the site consists of uncontrolled fills overlying native deposits of interlayered sandy soils and clay-silt soils, overlying native sands, overlying native sand and gravel. Groundwater was identified at depths of 10 feet below grade to 26 feet below grade, thus it is believed that groundwater will not be a substantive design or construction issue. Construction dewatering is expected to be limited, if needed at all. This is consistent with historical information in which West Commercial Street was created on landfill, including the subject property. The embankment on the north portion of the site is identified as Hinckley which is an "A" soil and is excessively draining. A geotechnical investigation was performed by Summit Geoengineering and their findings are consistent with these soils interpretations.

[2] See Geotechnical Report by Summit Geoengineering Services November 8, 2019.

There are three primary points of interest for this analysis:

1. The first is through the existing catch basin located in the gutter line 400' west of the sag curve in West Commercial Street, identified as Point of Interest #1 on the accompanying watershed maps. This catch basin is part of a small closed drainage system that ties into the nearby CSO line that extends down the Hill from Danforth Street, along an extension of Vaughn Street to West Commercial. There is a regulator structure for the Fore River Interceptor and a CSO outfall to the Fore River. It is believed the Catch basin ties into the CSO line and any water from the catch basin flows to the Fore River outfall.
2. The second Point of Interest is the existing catch basin located in the sag curve, identified as POI #2. The background associated with this catch basin is limited based on correspondence and requests for information Gorrill Palmer has exchanged with the City's DPW archivist. Various historical plans suggest that the two catch basins at the West Commercial Street sag may tie into a remnant drainage pipe that extended across what is now the Canal Landing Boat yard and discharged to the Fore River.[3] Further exploration and coordination with DPW is required to better understand these current street conditions.
3. The third point of analysis is at the gutter line along the frontage of the southeast corner of the site, identified as the Point of Interest #3. POI #3 connects to the 48" Fore River Interceptor Sewer, with flows continuing to the wastewater treatment plant or as overflow thru a number of CSO regulator/overflow structures that discharge to the Fore River. Two CSO's are located in the vicinity of the site; these are believed to be CSO 028 at Emery Street and CSO 029 – Commercial Street.[4]

12.2 Proposed Site Conditions

The proposed project design contemplates the existing soils, topography, local ordinances, and other applicable design standards. The VA Clinic development will consist of a 34,155 SF, two-story outpatient facility and a 35,880 SF, multi-level parking structure placed along the southern property line. The site will have three driveways with access to West Commercial Street. The main entrance/patient drop-off will be placed in between the two structures, approximately 370'± west of the southeast property corner. The other two driveways are placed at the west and east ends of the site and provide access for staff and patients/visitors, respectively. The proposed site conditions will include building rooftop, bituminous pavement including both Standard and Heavy-Duty pavement and areas of porous pavement sections, CIP concrete and landscaped areas.

As part of the City of Portland's sidewalk development program, a 10' wide multi-use sidewalk with a 5' grassed esplanade will be constructed in the right of way along the property frontage. This will also include adding vertical granite curb to the roadway. For this analysis, the associated area in the right of way that would not have otherwise been developed for the VA clinic project was not included in the calculations when determining required water quality treatment percentages. This area is defined in the calculation's summaries, as the sidewalk corridor in the West Commercial Street Right of Way along the property frontage, other than driveways associated with the VA Clinic. It was, however, modeled for flood control purposes, as it will ultimately contribute to the developed peak flow to each point of interest. **Overall, the VA Clinic development will create**

[3] See City DPW archives 00652_001_001 Right of Way Track and Map Portland Terminal, June 30, 1916 V-I-D/2-T

[4] See reports contained in https://www.portlandmaine.gov/1835/Reports-and-Assessments

approximately 3.95 acres of impervious area and 4.72 acres of developed area within the property boundary. The sidewalk development will create an additional 0.327 acres of impervious area and 0.485 acres of developed area within the West Commercial Street Right of Way.

The site will generally be graded to follow the existing topography, high in the north and draining south towards the three points of analysis along the property frontage in West Commercial Street. As part of the VA Clinic development the entire flat area up to the embankment, in the center of the site, will be grubbed and cleared. Excavation activity in this area will be subject to requirements set forth in a Site-Specific Environmental Media Management Plan to be prepared by S.W. Cole Engineering. The expected goals and objectives of the plan will be to retain all onsite soils containing ash, onsite. Clean soils (typically found greater than 2 feet below ground surface) may be exported or reused onsite. Ash containing soils will require a cover system consisting of concrete; asphalt or 12" to 24" of clean borrow/topsoil. The embankment to the north will be partially excavated to make way for the north side of the parking garage and an access drive around the garage. This area will require a retaining wall installed in the northeast corner of the site. A short retaining wall will also be installed on the back of the 10' sidewalk in order to overcome the grade difference between the site and West Commercial Street. The site is graded to have elevations similar to, or just above, existing grade to blend with the site topography and access grades at each of the driveways.

The porous pavement surface parking for 150 parking spaces will be located on the western portion of the property. An access drive/fire lane will be installed that will navigate through the rear of the site and connect the west and east entrances for emergency vehicles, delivery vehicles and other larger vehicles that need to access the rear of the buildings. The main entrance will consist of separated entry and exit lanes. There will be a 14' wide entrance lane and two 11' wide exit lanes for right and left turning exiting movements. The entrance will transition into a roundabout whereupon entering vehicles may enter the parking structure, or continue around to drop-off/pick-up patients. The main entrance will have access to the rear access drive but only for emergency vehicles and for snow removal. Pedestrian access will be provided to the proposed pathway sidewalk in the front of the property on both sides of the VA Clinic and from the parking structure. Seating areas have been provided around the main entrance and staff entrance to the VA Clinic as well.

Stormwater on the site will be collected by utilizing sheet flow and collected flow from catch basins and piped roof drains. The majority of the surface parking area on the west end will benefit from the use of porous asphalt pavement. The porous pavement system consists of porous asphalt placed over a multi-layer section of various aggregates for runoff storage and a filtering course all underlain by a collection layer. We are proposing an unlined system to allow some amount of runoff infiltration below since the existing site soils are very granular in nature and the groundwater is relatively deep across the site. This pavement section will contribute to both water quality treatment and quantity collection and control of stormwater runoff from the parking lot. An underground sand filter system with proprietary below grade storage will also be provided behind the buildings for the treatment and storage of runoff from the building roofs. A closed drainage system will collect runoff from the site and connect into the existing catch basin located in the vertical sag curve in West Commercial Street. A shallow swale will be graded on the toe of the northern embankment to collect runoff from the area to the north and redirect it around the site as the development footprint will interrupt this flow path. Other areas on the perimeter of the site will utilize existing topography to maintain flow to the same three points of analysis as the Pre-Developed condition.

Computer programs used to assist in the various components of this analysis include:

1. HydroCAD 10.00, HydroCAD Software Solutions LLC – used for modeling watersheds for pre and post development conditions.
2. Microsoft Excel, Microsoft Corporation – used for spreadsheet computations.
3. AutoCAD Civil 3D 2019, Autodesk - used to determine areas and graphical representation of design.

Data resources used to obtain the hydrologic input data for the stormwater models are identified later in this report.

12.4 Overview of Stormwater Runoff Modeling

The stormwater analysis evaluates the following elements:

- Pre-development and post-development stormwater runoff and peak discharge rates;
- The impacts of the VA Clinic development and subsequent modification to site discharge rates and locations;
- The effect of land cover modifications within the VA Clinic, including some that are expected to increase site runoff rates;
- The requirements for stormwater management including compliance with Chapter 500 flooding standards;
- Storm drainage requirements for parking areas, roof areas and other improvements; and
- Requirements for water quality measures.

12.5 Methods of Analysis

12.5.1. Stormwater Quantity

The hydrologic analyses for predevelopment and post development conditions have been conducted based upon the methodology contained in the USDA Soil Conservation Service's Technical Releases No. 20 and 55 (SCS TR-20 and TR-55) as modified for special site conditions. For this section of Cumberland County, Maine, a 24-hour SCS Type III storm distribution was used for the analysis using the following storm frequencies and rainfall amounts:

Table 2

Storm Event	24-Hour Rainfall
2-Year Storm	3.10
10-Year Storm	4.60
25-Year Storm	5.80

The HydroCAD computer program was used in the analysis. This program determines the critical points of the project watershed and uses SCS TR-20 methodology for evaluation of the anticipated conditions at these points.

Land use, cover, delineation of watershed sub-catchments, hydraulic flow paths, and hydrologic soil types were obtained using the following data:

1. Portland West, Maine USGS 7.5-minute Quadrangle Maps.
2. Cumberland County, USDA Medium Intensity Soils Survey.
3. Onsite Topographic Survey with 1-foot contour intervals prepared by Titcomb Associates, January 2016.

4. Boundary Survey by Titcomb Associates, November 2019.
5. The Class C Medium Intensity Soil Survey for the watershed areas.

12.5.2. Stormwater Quality

Water quality treatment for the development has been designed to meet the Stormwater Management Rules (Chapter 500) General Standard, which requires the treatment of at least 95% of impervious area and at least 80% of developed area generated.

12.6 Description of Site Watershed Models

The watershed models were developed to predict peak discharge rates at three points of analysis for the pre and post development conditions.

12.7 Predevelopment Conditions

The predevelopment conditions for this analysis were considered to be the original condition of the site as described in the Existing Site Conditions section above. We note that the historic use of the property, for perhaps at least a century or more, was as a rail siding with various sets of tracks and developed land area. Our analysis has not specifically accounted for those long-ago land uses on the site, including any levels of imperviousness attributable to the rail yard, including rail ties, yard area or other consolidated/packed surfaces. Point of analysis #3 ultimately connects to the Fore River Interceptor sewer pipe which normally drains to the wastewater treatment plant. During rainfall events, the catch basins at Points of interest #1 and #2 are believed to discharge to the Fore River via the combined sewer overflow to the west and a separate outfall, respectively. Figure W-1 depicts the three predevelopment watersheds and their corresponding hydrologic characteristics. It was determined in the medium intensity soil survey that the site contains cut and fill material[5] which does not have a designated hydrologic soil group. For this analysis, the area of the site that was found to contain cut and fill material was chosen to be associated with soil group B.

Table 12-1 below summarizes the predevelopment hydrologic characteristics for each subarea.

Table 12-1
Predevelopment Watersheds Hydrologic Characteristics

Watershed #	Area(ac)	CN	Hydrologic Time Of Concentration
1S – Area in West of Property	2.590	72	12.9
2S – Area in Center of Property	15.868	70	17.8
3S – Area in East of Property	0.396	63	5.9
Total	**18.854**		

Points of Interest (POI) #1 and #2 are both catch basins in West Commercial Street. POI #1 is approximately 400' west and upgradient from POI #2 but they are separate closed systems according to the records we have obtained from the City records. However, in large storm events, flows that the catch basin at POI #1 cannot handle are likely to bypass the system and continue east down the gutter line and enter the catch basin in the roadway sag at POI #2. POI #3 is a point in the gutter line in front of the southeast property corner that flows east to an existing catch basin in front of

[5] Indicative of the site's historic rail yard land use that involved manmade fill land and grading to accommodate multiple sets of tracks.

the Portland Star Match Building. The most important POI for this analysis is POI #2, which serves as the low point in the overall system and contributing area and will receive stormwater from the majority of the development. Our current understanding of the POI#2 location is unclear as to its discharge as our search thru available City archives has not provided definitive evidence of these site conditions. We are hopeful that City Staff may have a better opportunity to investigate these conditions as we proceed through the review process.

The Pre-Development HydroCAD model has been designed to demonstrate how stormwater flows to the three POI's and, more importantly, how POI #1 and POI #2 interact in large storm events. The catch basin of POI #2 has a 10" pipe outlet according to our survey information and that pipe may cross West Commercial Street and connect to another catch basin positioned on the south side of the street. The outfall of the existing catch basin on the south side of the street is not known. In recent storm events[6], ponding has been observed above the catch basins at POI#1 and #2, mostly likely due to the following:

- High rainfall (>2")
- High tide conditions
- Recent temporary snow pile and construction conditions on the south side of the street within the Canal Landing site
- Inadequate capacity within the outfall pipe from the CB's at POI#2. As this pipe condition is not fully known and identified, we are uncertain as to the capacity.

For the purpose of this analysis, POI #2 was also modeled with a broad crested weir that represents the centerline crown in West Commercial Street that allows ponding in the model and helps gauge possible street surcharge conditions. The consideration of the street sag acting as a control relies on the assumption that water breaching the street is allowed to flow freely onto the property to the south side of the street (Canal Landing)[7]. Using this method, the HydroCAD model predicts street flooding under predevelopment conditions, similar to the anecdotal evidence of recent storm event observations. Table 12-2 below summarizes existing flow rates at POI #2 and the height of water over the crown in the road during the 2, 10, and 25-yr storm events:

Table 12-2
Predevelopment Flow Rate & Ponding At POI #2

Storm Event	Additional Flow From POI#1 (cfs)	Total Flow at POI#2 (cfs)	Depth of Water Overtopping Crown in Road (ft)
2-yr	0.00	0.92	0.00
10-yr	0.06	6.82	0.21
25-yr	0.23	14.90	0.36

As demonstrated in the Pre-Developed HydroCAD model for the 2-yr storm event, the catch basin at POI #1 does not send any additional flow to POI #2 and the catch basin at POI #2 is able to collect the contributing runoff without overtopping the crown in the road. In the 25-yr storm event (5.80" of rain), street ponding occurs and overtops the crown in the road approximately 4.32".

[6] Peak rain event on December 14, 2019.

[7] Historically we believe that the street has likely experienced routine periodic flooding and that water "escapes" the street by breaching onto the former rail yard (now Canal Landing) site and ultimately sheets across that property to the Fore River.

Although this seems unfavorable, we note that flooding similar to this is a common occurrence in areas around the shoreline and the Commercial Street corridor which has been observed in recent storm events. In this scenario the crown in the road overtops, stormwater flows toward the other catch basin or to the south side of the street and simply sheet flows to the Fore River, less than 300 feet away.

12.8 Post-development Conditions

In the developed condition, the VA Clinic will create 3.95 acres of new impervious area (including porous and regular pavement, concrete, and rooftop) and 4.72 acres of new overall developed area. Runoff from the development drains to three primary systems:

- A small portion of the proposed sidewalk will sheet flow to West Commercial Street and into the existing catch basin at POI #1.

- The majority of the onsite developed area will be captured through a new closed collection and pipe network consisting of several stormwater BMP's around the entire site. This system will connect to the existing catch basin and additional runoff from the proposed sidewalk in the street will drain to POI #2.

- A portion of the east driveway entrance and sidewalk will drain toward West Commercial Street and continue east along the gutter line into the existing catch basin downgradient of POI #3. There will be a reduction in the site's contributing area to POI#3 and thus less runoff reaching that POI.

Due to the size, length, and elevation constraints of the site, it was determined that traditional, centralized stormwater management approaches would not be ideal. Instead, several stormwater BMP's have been designed that will treat different portions of the site. These BMP's are utilized in order to provide proper treatment and storage. By providing BMP's throughout the site, overall time of concentrations for the subcatchments are small and have been modelled as direct entry in the Post-Development HydroCAD model.

Test pits and borings were taken in October 2019. The geotechnical report performed by Summit Geoengineering Services has been included in Section 11, Attachment E of this Application.

Figure W-2 depicts the post-development watershed conditions and the corresponding hydraulic properties. The post-development watershed model is similar to the predevelopment model in that the outlet points (POI's) are the same and can be compared directly. Within the model, the first number of the subcatchment ID corresponds to the point of interest that it flows to. The following is a listing of the watersheds associated with the proposed development.

Table 12-3
Post-development Subcatchments Hydrologic Characteristics

Subcatchment #	Area(ac)	CN	Hydrologic Time Of Concentration
1S – West Area	2.59	58	12.9
2S-A – Embankment	10.613	53	16.4
2S-B – West Driveway	0.058	72	5.0

Table 12-3 Post-development Subcatchments Hydrologic Characteristics			
Subcatchment #	**Area(ac)**	**CN**	**Hydrologic Time Of Concentration**
2S-C – West Parking	1.546	94	5.0
2S-D – Loading Dock	0.033	98	5.0
2S-E – Rooftop & East Side	2.466	95	5.0
2S-F – Frontage/ROW	1.396	90	12.3
3S – East Area	0.152	84	5.0
Total	**18.854**		

In the post-developed condition, subcatchment group 1S has stayed the same with the exception of approximately 1,260 SF of impervious area and 1,200 SF of landscaped area associated with the sidewalk development. Subcatchment 2S's overall area increased to 16.112 acres from 15.868 acres. Subcatchment group 3S decreased to 0.152 acres from 0.396 acres due to the development of the east entrance which is being captured and treated in Subcatchment 2S-E.

The design includes specific onsite measures for the retention of stormwater runoff attributable to the development. These include an underground storage system behind the proposed buildings that will serve to store and treat roof runoff and a smaller percentage of yard areas. The proposed parking lot will also consist of a porous asphalt pavement section that will contain a 12" layer of clean crushed stone. Based on a 40% void ratio in the stone, its storage capacity is approximately 4.8" of runoff. These storage volumes have been accounted for in the accompanying post-development analysis.

The following table reflects the pre- and post-development peak rates of runoff at the three points of interest:

Table 12-4 Comparison of Peak Discharge Rates at Points of Interest Pre-Development to Post-Development			
Storm Event & Condition	**POI #1 (cfs)**	**POI #2 (cfs)**	**POI #3 (cfs)**
2-Yr Predevelopment	0.30	0.92	0.15
2-Yr Post Development	0.30	4.69	0.29
Change in 2-Yr Peak Discharge Rate	**0.00**	**+3.37**	**+0.14**
10-Yr Predevelopment	1.71	6.82	0.53
10-Yr Post Development	1.71	13.74	0.52
Change in 10-Yr Peak Discharge Rate	**0.00**	**+6.92**	**-0.01**
25-Yr Predevelopment	3.37	14.90	0.90
25-Yr Post Development	3.37	20.95	0.71
Change in 25-Yr Peak Discharge Rate	**0.00**	**+6.05**	**-0.19**

The summary table shows that peak discharge at POI#2 increases in the post development analysis. This is not solely because of the VA Clinic development. Several other factors lead to the calculated increase in peak flow at the POI #2. The entire site developed area is 4.72 acres but the entire area

for subcatchment group 2S is actually 16.111 acres in the post-developed condition, which is a small increase in overall watershed area to POI#2. This additional land that contributes to POI #2 comes from two main areas; the right of way in the front of the property and the steep northern embankment and residential area to the north of the site, off Danforth Street. By developing the site, the runoff that flows down the embankment from the north has to be collected at the toe of slope and redirected around the site in a closed system. This action theoretically decreases the time of concentration in the post-developed condition and, subsequently, yields a higher peak rate of discharge associated with an area that will remain undeveloped. Simply put, runoff from the hillside and rear yards of the house lots off Danforth Street used to cross the flat lower section of the development site and that increased the travel time and lowered the runoff rate to the point of interest in the predevelopment condition. By eliminating the lower flat portion of the runoff travel path and effectively collecting the runoff in a pipe system, the travel time to the POI is reduced and the resultant model shows increased runoff and peak discharge to the POI.

In order to properly model the post-development condition, the sidewalk development in the right of way was included in the HydroCAD model. This also increases the amount of runoff that reaches all of the Points of Interest. Land cover types for subcatchment 1S in the pre- and post-developed condition stayed the same except for area associated with the sidewalk. However, the small amount of area from the sidewalk compared to the existing subcatchment resulted in no change from pre- to post-developed conditions. Subcatchment 2S contains the largest portion of the sidewalk development; totaling approximately 18,120 SF of developed area. Subcatchment 3S decreases in total area from the pre- to post-developed condition and peak discharges decrease in the 10- and 25-yr storm events but insignificantly increases in the 2-yr event. Without the additional sidewalk area that drains to POI #3, the post-developed 2-yr peak discharge would be less than the pre-developed condition. Alternatives were evaluated to attempt to capture, treat, and store the runoff generated by the sidewalk. This was found to be unfeasible due to the lack of space in the right of way and the presence of several utilities located in the right of way currently that would conflict with any stormwater management BMP's. Most importantly, this includes an underground 115KVA power transmission line.

In the pre-developed condition, it was determined that ponding occurs above the catch basin at POI #2. This has also been observed by GP personnel in the field. Table 12-2, above, demonstrated the relationship between the catch basins at POI #1 and POI #2 and the depth of street flooding for the associated storm events. Table 12-5, below, compares the depth of ponding and difference in peak discharge at POI #2 between the pre- and post-developed conditions:

Table 12-5
Pre- and Post-Development Flow Rate Difference & Ponding At POI #2

Storm Event	Difference in Flow From POI #1 (cfs)	Difference in Total Flow at POI #2 (cfs)	Depth of Water Overtopping Crown in Road (ft)		Difference in Depth of Water Overtopping Crown in Road	
			Pre	Post	in.	ft
2-yr	0.00	+3.37	0.00	0.13	+1.63	+0.13
10-yr	+0.03	+6.92	0.21	0.34	+1.63	+0.13
25-yr	+0.09	+6.05	0.36	0.43	+0.875	+0.07

This is an important comparison to make because, although the peak flow rates increase for all storm events at POI #2, the depth of water that is ponding only increases by 1.63" in the 2- and 10-yr storm event, and 0.875" in the 25-yr storm events. Generally speaking, in both the pre- or post-developed conditions, ponding is occurring at this location. As previously explained, stormwater generated on and off site ultimately discharges to the Fore River. Because of this fact, and the other factors explained above, **we are requesting a waiver from the Flooding Standard.**

12.9 Stormwater Management Summary

Under the General Standards, the project is required to meet the BMP Standards, as the development site is not tributary to a lake watershed. The project contains new construction that will also be required to meet the treatment standards of Chapter 500. The following sections summarize the BMP's that are being employed to meet the water quantity and quality standards for the proposed development.

12.9.1. Porous Pavement

Underdrained porous asphalt pavement will be installed in all of the parking spaces on the west side of the VA Clinic building and a portion of the drive aisles. Direct absorption or sheet flow from adjacent areas will flow down through the porous pavement and through a sand filter section before being collected in underdrain pipes that will connect to the closed collection system that ultimately connects to the existing catch basin at POI #2. The porous pavement filter section was designed in accordance with Section 7.7 of the BMPS Technical Design Manual dated May 2016. We propose to not place a liner under the system, thus allowing some amount of infiltration into the native soils below, principally as these soils are granular in nature, the groundwater depth is greater than 5' below the bottom of the system and there are no specific groundwater resource concerns as the site is so proximate to the Fore River and tidal (saltwater) conditions.

In the HydroCAD model, the porous pavement filter is labeled as Pond 2P – Porous Pavement. The porous pavement filter area is oversized for the tributary area draining to it and exceeds the standard for 20% of the contributing area running onto it. It should be noted that the stone storage section will also be constructed underneath the heavy-duty pavement section for ease of construction and continuity in the drainage section. This, along with the oversized filter area, provides a water quality volume that treats more than the first two inches of runoff which in turn controls additional flow for flood control purposes. The reservoir layer contains 4" overflow pipes that will connect to a storm drain collection line on the south side of the parking lot. An orifice will control the release of stormwater from the porous pavement area such that the area will drain dry between 24-48hrs.

In total, the porous pavement will provide treatment for 1.387 acres of impervious area and 1.546 acres of developed area. Design calculations for the porous pavement filter are included in Attachment C.

12.9.2. Subsurface Sand Filter

A subsurface sand filter with R-Tank® storage above will be installed underneath the rear access drive. It will treat water from both building rooftops, and impervious and landscaped area in the main entrance and rear access drive. Roof drain leaders will pipe directly into the system from the buildings. Additional runoff will sheet flow into catch basins that will

discharge into the system. Initial stormwater flows will enter the pretreatment rows of the system. From there it will flow into the rest of the reservoir layer that is sized for the water quality volume. Stormwater will then flow vertically through a sand filter section before being collected in underdrain pipes that connect to the closed conveyance system that ultimately drains to the catch basin in West Commercial Street at POI #2. The subsurface sand filter section was designed in accordance with Section 7.3 of the BMP's Technical Design Manual dated May 2016 and the DEP approval letter for the R-Tank dated January 11, 2019.[8]

In the Post-developed HydroCAD model, this BMP is labeled as Pond 4P - Subsurface Sand Filter. This specific configuration of subsurface sand filter uses a MaineDEP approved R-Tank® storage system above the sand filter, rather than below. The storage volume provided is equal to the water quality volume, which is the volume associated with 1" of rain contributing from impervious areas and 0.4" of rain from landscaped areas. Outlet control structures at each end of the system will allow water to flow into the pretreatment rows in the system first. The structures at the inlet to the system will also have weirs set at the defined water quality volume elevation, so that excess flow bypasses the system and flows to the closed conveyance system. An orifice will control the release of stormwater from the subsurface sand filter area such that the area will drain dry between 24-48 hrs.

In total, the subsurface sand filter will provide treatment for 2.272 acres of impervious area and 2.466 acres of developed area. Design calculations for the subsurface sand filter are included in Attachment C.

12.9.3. FocalPoint® Modular Biofiltration System

A FocalPoint® system[9] will be employed to provide quality treatment for a small portion of the west driveway entrance and landscaped area. The system consists of a shallow (6-12") depression filled with 18" of a soil filter media and planted with a variety of grasses and shrubs. Runoff entering the cell is detained temporarily before passing through the filter media. The filter media has a high flow rate (100 in/hr) that allows high amounts of runoff to be handled in a smaller footprint. The stormwater is then controlled below the filter section with a chamber storage system before being released downstream to a treatment row. An underdrain pipe then collects and discharges the stormwater from the system and connects to the site's closed conveyance system that discharges to POI#2. An overflow standpipe with a beehive grate is set approximately 6" above the filter bed and captures stormwater that cannot be handled in larger storm events.

The FocalPoint® will provide treatment for 0.018 acres of impervious area and 0.058 acres of developed area. Design calculations for the FocalPoint® Bio-filtration system are provided in Attachment D of this Application.

12.10 Water Quality Summary

The construction of BMP's employed as part of the development will help to treat the stormwater generated from the development as much as practically possible. The porous pavement, subsurface sand filter, and FocalPoint® successfully treat approximately 3.68 acres of impervious area and 4.04

[8] See letter from Mark Bergeron to ACF Environmental, January 11, 2019 available at https://www.maine.gov/dep/land/stormwater/stormwaterbmps/manufactured-systems/R-Tank%20approval%20letter.pdf

[9] See https://www.maine.gov/dep/land/stormwater/stormwaterbmps/manufactured-systems/focalpoint-january2017.pdf

acres of developed area. This equates to overall treatment percentages of 93.16% and 85.59% for impervious and developed area, respectively. Table 12-6, below, demonstrates the treated impervious and developed areas by percentage for each BMP employed:

	Table 12-6 Treatment Percentage by BMP			
	Porous Pavement	**Subsurface Sand Filter**	**FocalPoint**	**Total**
Impervious	35.19%	57.51%	0.46%	93.16%
Developed	32.76%	51.61%	1.22%	85.59%

It was realized that, due to the site being raised above West Commercial Street, approximately 0.234 acres of the driveways and other impervious area along the property frontage would not be treatable due to the slopes and presence of utilities in the right of way. Similarly, the proposed loading dock truck well is not treated by the aforementioned BMP's. These impervious areas represent approximately 5.92% of the total impervious area and, therefore, the overall treatment percentage for impervious areas fall slightly below the 95% treatment standard. The overall developed area treatment is 85.6% which exceeds the required developed area treatment standard of 80%.

In an effort to increase the overall treatment of the impervious areas, two additional measures have been considered. The first is a catch basin filter cartridge[10] insert that would be installed in the loading dock catch basin. This will treat an additional 1,445 SF. Treating the area tributary to the loading dock increases the overall impervious treatment percentage to 93.95%. The second measure to improve overall impervious area treatment was the increase in water quality volume provided in the porous pavement section. In order to offset the small amount of impervious area not treated to meet the standard of 95%, the porous pavement section will contain a water quality volume that will provide storage to treat 2" of runoff from the impervious area and 0.8" of runoff from the landscaped area. By treating twice the amount required for an area approximately 1.55 acres in area, it is our opinion that this will provide satisfactory treatment of the stormwater runoff that is generated by the VA Clinic Development. The proposal to increase the runoff treatment depth is consistent with Chapter 500, Part 4.C (2) (a) (ii).

Water Quality Calculations that demonstrate the compliance with Chapter 500 for the VA Clinic development are provided in Attachment C. A summary of the calculations is provided below:

VA Clinic Treatment Summary

Total Impervious Area =	3.95 acres
Total Developed Area =	4.72 acres
Impervious Area Treated =	3.71 acres
Percent Impervious Area Treated =	93.95%*
Developed Area Treated =	4.07 acres
Percent Developed Area Treated =	86.30%

*(Standard met by increasing treatment depth in the Porous Asphalt zones and employing a catch basin filter cartridge in the loading dock truck well)

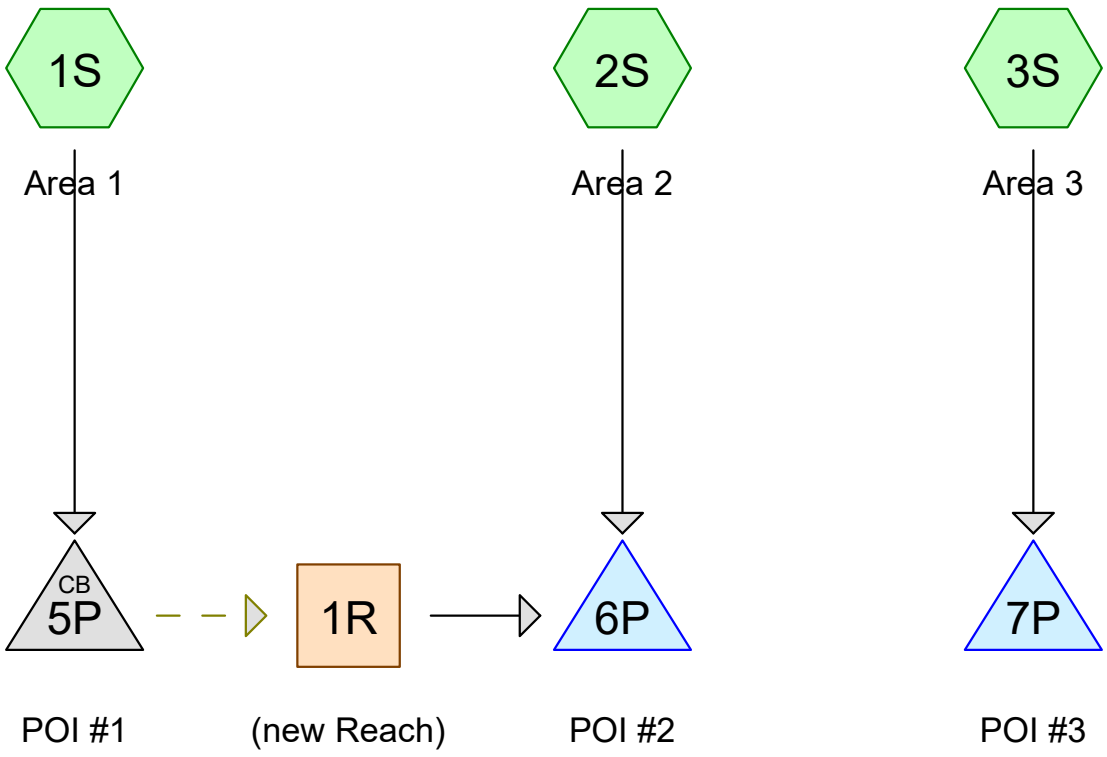
12.11 Maintenance of Facilities

The stormwater management facilities will be maintained by the Applicant or their assigns after construction is completed. The general contractor will be responsible for maintenance during construction. The contract documents will require that the contractor designate a person for maintenance of the facilities during construction as required by this application. Long-term operation/maintenance schedules for the facilities are provided in the O&M Manual included in Attachment F to this report.

12.12 Conclusions



The Stormwater Management Plan for this project outlines the measures proposed to achieve compliance with the Chapter 500 Stormwater Management standards for water quality treatment. The design includes stormwater quantity controls including storage components within the porous pavement cross section and within the roof drainage sand filter system. The site will discharge to a municipal system that outflows to the Fore River which is major river segment that is under tidal influence, thus the applicant is seeking a waiver of the flooding standards. The majority of the proposed development will be tributary to one closed storm drain system with one point of discharge. A minor amount of development area will direct runoff to two other discharge locations within the municipal street system and these impacts are considered insignificant.

Based on the proposed design, the runoff from the proposed development will be captured and conveyed in a manner that will not have an adverse impact to the surrounding stormwater systems or the environment.

HIGH PERFORMANCE MODULAR BIOFILTRATION SYSTEM

US DEPT OF VETS AFFAIRS – COMMUNITY OUTPATIENT – PORTLAND, MAINE

MAINE – CHAPTER 500 DESIGN WORKSHEET/CHECKLIST

1. FocalPoint Bed Area (min 174 square feet per acre of impervious area (e.g. 0.2 acres = 35 sf))

- Tributary Impervious area = 0.030 ac. (A)
- Tributary Pervious area = 0.103 ac. (B)
- Min FocalPoint bed area req'd = (((A) x 1.0) + ((B) x 0.4)) * 174 = 12.4 sf.
- FocalPoint Bed Area provided * = 20 sf.
- Dimensions of Proposed FocalPoint = 3 ft x 6.67 ft

* see criteria 2. to determine if minimum size is appropriate.

2. A 0.95 inch Type III 24hr rainfall event shall be modelled to demonstrate the entire storm volume is treated prior to activation of the overflow (typically set at 6-12" above the mulch)

- Temporary storage depth provided = 6 inches (typ 6" to 12")
- Temporary storage volume provided at above depth = 25 cubic feet.
- Peak ponding depth from 0.95" 24hr storm event = 0 inches

3. Ratio of the surface area of the filter media (sf) to the temporary ponding volume (cf) shall be no less that 1:5

- Ratio of FocalPoint Bed Area : Temporary Storage Vol = 1 : 1.25

4. Subsurface R-Tank or Chamber Treatment Row must be sized to treat the peak flow from a 1 yr-24hr storm event.

- 1yr 24hr Peak Flowrate = 0.05 cfs
- Chamber model selected
  - Cultec 330 XLHD (1 chamber per 0.227 cfs) ☐
  - Cultec 150XLHD (1 chamber per 0.185 cfs) ☐
  - R-Tank modules (1 module per 0.02 cfs) ☒
- Number of Chambers/modules required = 3

5. Controlled release of the Channel Protection over 24-48 hrs

- Controlled release of the channel protection volume is being achieved by:
  - Expanded subsurface storage basin with OCS ☐
  - Surface detention basin with OCS ☐

6. A landscape plan for the FocalPoint bed area has been prepared ☐

7. The Design shall be reviewed by the manufacturer's representative prior to submission and installation will be overseen by the manufacturer's representative.

- The Design has been reviewed by ACF Environmental ☐
- Engineer will coordinate installation inspection with ACF ☐

Subject:	RE: VA Portland - Weekly Team Meeting
Date:	Monday, October 28, 2019 1:53:16 PM

Based on the subsurface conditions encountered at the parking garage area and my analyses I will be recommending the following for the proposed garage in my supplemental geotechnical report. Note that these recommendations are similar to the recommendations I forwarded on October 7, 2019.

Foundation Type: Conventional spread footing foundations.

Allowable Bearing Pressure = 3,000 psf. Maximum settlement 1.1 inch. Settlement range 0.4 to 1.1 inches. Total and differential settlements acceptable for steel framed structure.

Required frost protection depth = 4 ft

Subgrade preparation for interior and exterior isolated column footings

1. Excavate the building footprint to 12 inches below the base of the proposed slab.
2. Proofroll entire building footprint using a vibrator compactor having a minimum weight of 10 tons and making a minimum of 4 passes in each of two perpendicular directions. This is intended to densify the existing fill soil.
3. Excavate to 12 inches below the base of the footings. Proofroll the exposed subgrade by making a minimum of 4 passes using a vibratory plate compactor with a minimum weight of 2 tons.
4. Install a layer of woven geotextile such as Mirafi RS280i on the proof-rolled subgrade soil. Extend the geotextile at least 2 feet beyond the edge of the footing all around.
5. Place a minimum of 12 inches of ¾ inch crushed stone directly on the geotextile. Compact the stone with a vibratory plate compactor.
6. Construct the footing directly on the compacted crushed stone. For exterior column footings the crushed stone can be included in the frost protection depth if desired, reducing the minimum depth from the bottom of the footing to the exterior finished grade to 3 feet.

Subgrade preparation for perimeter footings (assume 2 kips/ft linear load):

1. Excavate to the base of the footing (minimum 4 feet frost protection depth).
2. Proofroll the exposed soil by making a minimum of 4 passes using a vibratory plate compactor with a minimum weight of 2 tons.
3. Construct the footings directly on the proofrolled soil. The use of crushed stone and geotextile is optional.

Other recommendations:

- Perimeter underdrains are not necessary.
- Seismic Site Class D (based on limited SW Cole soil boring data – no borings were carried to refusal so the depth of bedrock is unknown).
- Slab constructed on a minimum of 12 inches of ¾ inch crushed stone placed directly on the proofrolled subgrade soil (no geotextile necessary).
- Base friction coefficient between CIP concrete and crushed stone = 0.60
- Based friction coefficient between CIP concrete and existing soil = 0.40

Hopefully the above info will keep the project moving forward until I can prepare the supplemental report.

Please contact me with any questions or if any additional information is needed.

Reference: Geotechnical Investigation, Proposed VA CBOC and Parking Garage
West Commercial Street, Portland, Maine

Dear Claiborne;

Summit Geoengineering Services, Inc. (SGS) has completed a geotechnical investigation for the proposed VA CBOC and Parking Garage at West Commercial Street in Portland, Maine. Our scope of services included reviewing available information, including a preliminary geotechnical report prepared by S.W. Cole Engineering, observing 8 test pits at the site, performing laboratory tests, and preparing this geotechnical report summarizing our findings and providing geotechnical recommendations for the design and construction of the new building and parking garage foundations.

Our scope of services for this project did not include an environmental site assessment or further investigation for the presence or absence of hazardous or toxic material on, below, or around the site. No hazardous materials were encountered in the test borings completed at the site.

1.0 Project and Site Description

The project consists of the construction of a new 2 story MOB with a footprint of approximately 250 feet by 120 feet and a 2 to 3 story parking garage with a footprint of approximately 280 feet by 120 feet. The MOB will have a slab on grade at or near elevation 22.5 feet. The parking garage will have a pavement or concrete ground surface at or near elevation 23.5 feet. The proposed loads are as follows:

CBOC:	DL = 20 kips to 162 kips LL = 23 kips to 179 kips
3-Story Garage:	DL = 78 kips to 962 kips LL = 20 kips to 471 kips
2-Story Garage:	DL = 55 kips to 675 kips LL = 14 kips to 330 kips

Additional construction includes paved driveways and parking lots and retaining walls.

The existing site is an open field with grass and brush. An abandon rail line is present adjacent to West Commercial Street. The ground surface in the proposed CBOC area is relatively flat ranging in elevation from 22 feet to 24 feet. The ground surface in the southern two-thirds of the proposed parking garage ranges from elevation 22 feet to elevation 25 feet. The grade rises steeply to the north up to elevation 40 feet in the northeast corner of the footprint. Cuts of up to 20 feet will be required to construct the proposed parking garage. The cuts will require retaining walls.

2.0 Subsurface Exploration and Laboratory Testing

2.1 SGS Subsurface Explorations

SGS observed the subsurface conditions with the excavation of 8 test pits on September 25, 2019. The tests pits were excavated to depths ranging from 8 to 13 feet by Shaw Brothers using a tracked excavator under the direction of SGS. The location of the test pits are shown on the Exploration Location Plan in Appendix A. Logs of the test pits are included in Appendix B.

2.2 S.W. Cole Engineering Subsurface Explorations

A total of 7 test borings were completed by S.W. Cole Explorations, LLC in September 2015. An additional 17 test borings were completed at the site in July 2019, also by S.W. Cole Explorations, LLC. The location of the borings are presented on the Exploration Location Plan in Appendix A. Logs of the borings are included in Appendix C.

2.3 Laboratory Testing

A grain size analysis and moisture content test was performed on a sample taken at a depth of 4 to 6 feet at the TP-3 location. The grain size test indicated that the sample contained 15% gravel, 84% sand, and 1% silt. The moisture content was 2.5%. A report of the tests are included in Appendix D.

3.0 Subsurface Conditions

3.1 Soil

The following subsurface layers and thicknesses were encountered in our investigation,

- ***Fill***
- ***Glaciomarine Fan*** *(interbedded sand and gravel with local silty clay drapings)*

The ***Fill*** was encountered starting at the ground surface and extending to a depth of approximately 3 feet to greater than 13 feet (TP-8 location) below the ground surface. The composition of the fill encountered in the test pits is summarized in the following table.

FILL DESCRIPTION		
Location	**Thickness**	**Description**
TP-1	3 ft	Silty sand with thin layer of ash
TP-2	10 ft	Silt with ash (1 ft) **over** gravelly sand, trace silt, asphalt piece at 6 ft
TP-3	9 ft	Silt with trace ash (1 ft) **over** sand, little gravel, trace silt
TP-4	8 ft	Silt with trace ash and gravel (1 ft) **over** gravelly sand, trace silt
TP-5	4 ft	Silt with trace ash and gravel (1 ft) **over** gravelly sand, trace silt
TP-6	3 ft	Silt with trace ash and gravel (1 ft) **over** gravelly sand, trace silt
TP-7	10 ft	Sand, little gravel **over** silty clay mixed with sand, **over** sandy gravel, little silt trace clay
TP-8	13+ ft	Sand, little gravel **over** gravelly sand, little silt mixed with clay balls

In general the fill was dry and loose except at the TP-7 and TP-8 locations where it was firm or compact. There were no man-made products or organic material observed in the fill soil. The grain size test at a depth of 4 to 6 feet at the TP-3 location indicated that the sample contained 15% gravel, 84% sand, and 1% silt.

The ***Glaciomarine Fan*** deposit is generally composed of layers of sand and sand and gravel. Periodic layers of silty clay and clayey silt were encountered (TP-7, B-108, B-202, B-203, B-204, B-205, B-301, B-302, B-304, B-308, B-102) at various depths and thicknesses.

The SPT-N values in the sand and sand and gravel deposits ranged from 7 to 93 and averaged 26 blows per foot. SPT-N values in the silty clay layers ranged from 2 to 21 and averaged 9 blows per foot.

Detailed descriptions of the soil types and stratigraphy are included on the logs in Appendix B and C.

3.2 Bedrock

Refusal was not encountered at the site in the borings or test pits. The deepest boring was drilled to a depth of 40 feet below the existing ground surface (elevation -18 feet).

3.3 Groundwater

Groundwater was observed in the S. W. Cole Engineering borings ranging from elevation 3 feet to elevation 5 feet. Groundwater levels are shallower as the grade rises to the north.

Groundwater levels do fluctuate seasonally and the recorded level may be higher or lower than the actual levels during the construction period. Groundwater levels will generally be lower in the middle of the summer and winter and higher in the spring and fall.

4.0 Geotechnical Evaluation

In general the soil at the site is suitable to support the proposed building and parking garage. The geotechnical challenges are the presence of loose pockets or fill in specific areas, periodic layers of silty clay, the large magnitude of the parking garage loads, and the deep cut at the north and northeast sides of the proposed parking garage.

The pockets of loose fill and silty clay can be densified by proof rolling and local ground improvement such as geotextile and crushed stone can be used to allow for use of conventional spread footings for both structures. The majority of the parking garage loads dead loads. These loads will cause immediate settlement of the underlying soil. Additional settlement will occur incrementally as additional structure is built. This process will allow for adjustments to be made to the structure as it is built, if necessary, to accommodate small settlements. After the structure is built, the only remaining loads creating settlement will be the live loads.

A global stability analysis was performed on the areas where deep excavation into the ground and retaining walls will be required. In general the cut slopes will be stable. Recommendations for maximum slope steepness and design and construction of the retaining walls are presented in this report.

5.0 Geotechnical Recommendations

5.1 Foundation Bearing Pressure

We anticipate that footings will be constructed on the native glaciomarine fan deposit or existing fill soil. Based on our analyses and assuming that the following guidelines are used, the proposed building and parking garage can be supported on conventional isolated and continuous spread footings proportioned using an allowable bearing pressure of 3,000 psf.

The total settlement at the proposed building associated with this bearing pressure is estimated to range from 0.4 inches to 0.8 inches. The total settlement at the proposed parking garage location is estimated to range from 0.6 inches to 1.2 inches. Differential settlement at both the building and parking garage will be negligible.

5.1.1 Subgrade Preparation Proposed Building. The above allowable bearing pressure and associated settlement are based on the following subgrade preparation recommendations for the CBOC.

- Excavate the building footprint to 12 inches below the base of the proposed slab.

- Proof roll entire building footprint using a vibrator compactor having a minimum weight of 10 tons and making a minimum of 6 passes in each of two perpendicular directions. This is intended to densify the existing fill soil.
- Excavate to the base of the footings. Proof roll the exposed subgrade by making a minimum of 4 passes using a vibratory plate compactor with a minimum weight of 2 tons.
- Notify SGS to observe the footing subgrade conditions.
- Construct the footing directly on the proof rolled native soil, unless otherwise directed by SGS.

5.1.2 Subgrade Preparation Proposed Parking Garage. The above allowable bearing pressure and associated settlement are based on the following subgrade preparation recommendations for the parking garage.

- Excavate the building footprint to 12 inches below the base of the proposed slab.
- Proof roll entire building footprint using a vibrator compactor having a minimum weight of 10 tons and making a minimum of 4 passes in each of two perpendicular directions. This is intended to densify the existing fill soil.
- Excavate to 12 inches below the base of the footings for a 2-story structure and 24 inches below the base of footings for a 3-story structure. Proof roll the exposed subgrade by making a minimum of 4 passes using a vibratory plate compactor with a minimum weight of 2 tons.
- Install a layer of woven geotextile such as Mirafi RS280i or approved equivalent on the proof-rolled subgrade soil. Extend the geotextile at least 3 feet beyond the edge of the footing all around.
- Place a minimum of 12 inches (2-story structure) or 24 inches (3-story structure) of ¾ inch crushed stone directly on the geotextile. Compact the stone with a vibratory plate compactor.
- Construct the footing directly on the compacted crushed stone. For exterior column footings the crushed stone can be included in the frost protection depth if desired, reducing the minimum depth from the bottom of the footing to the exterior finished grade to 3 feet.

5.2 Frost Protection

The design air freezing index for the Portland area is approximately 1,200 degree F days (10 year, 90% probability). Based on this, a total of 4 feet of frost protection should be provided for the exterior footings. For the parking garage the 12 inches of ¾ inch crushed stone can be considered in the total frost protection depth reducing the depth of the bottom of the footing from the exterior finished grade to 3 feet.

We recommend that the exterior of all foundation elements exposed to freezing temperatures can be backfilled with Foundation Backfill (FB). FB shall consist of soil having a maximum particle size of 4 inches and having a maximum of 7% finer than the #200 sieve. FB should be placed in 6 to 12 inch lifts and compacted to 95% of its optimum dry density determined in accordance with ASTM D1557.

We recommend that the backfill on the interior of the foundation walls in heated areas consist of Structural Fill (SF, see Section 5.4).

5.3 Seismic Design

Based on the subsurface data collected in the borings, we recommend Site Class D be used in accordance with the ASCE 7-16 Code. The following seismic site coefficients should be used:

SUBGRADE SITE SEISMIC DESIGN COEFFICIENTS - IBC	
Seismic Coefficient	**Site Class D**
Short period spectral response (S_S)	0.281
1 second spectral response (S_1)	0.072
Maximum short period spectral response (S_{MS})	0.443
Maximum 1 second spectral response (S_{M1})	0.172
Design short period spectral response (S_{DS})	0.295
Design 1 second spectral response (S_{D1})	0.115

There are no soil conditions at this site that are considered susceptible to liquefaction during seismic events.

5.4 Slabs-on-Grade

We recommend that slabs on grade in heated areas placed on a minimum of 12 inches of Structural Fill (SF, see table below) or ¾" crushed stone (CS). If SF is used, it should be compacted to 95% of ASTM D1557. The subgrade soil beneath the CS or SF should be proof rolled by making a minimum of 6 passes in each of two perpendicular directions using a vibratory rolled with a minimum operating weight of 10 tons (see Section 5.1). Soft and loose areas or areas containing demolition debris, organics, and similar unsuitable materials should be removed and replaced with SF or CS.

Where fill is required beneath the SF under the slab, it should consist of FB as described in Section 5.2 above. FB should be placed in 12 inch lifts and be compacted with a minimum of 4 passes in each of two perpendicular directions with a vibratory roller.

We recommend that slabs-on-grade constructed in unheated building areas or exterior slabs be constructed on a minimum of 24 inches of SF or 1 inch of rigid insulation placed over 12 inches of SF.

STRUCTURAL FILL (SF)	
Sieve Size	**Percent finer**
3 inch	100
½ inch	35 to 80
¼ inch	25 to 65
No. 40	0 to 30
No. 200	0 to 7

Reference: MDOT Specification 703.06, Type

CRUSHED STONE ¾ INCH	
Sieve Size	**Percent finer**
1 inch	100
¾ inch	90 to 100
1/2 inch	20 to 55
3/8 inch	0 to 15
No. 4	0 to 5

Reference: MDOT Specification 703.12, Crushed Stone ¾"

SF have a maximum particle size of 4 inches. SF should be compacted to 95% pf ASTM D1557. CS should be compacted with a vibratory compactor to lock the particles together.

5.4 Asphalt Surfaces

Based on the proposed finish grades within the building footprint, the pavement base soil will be constructed on the existing or imported fill or the glaciomarine fan deposit. The mean annual freezing index for the Portland area is estimated at 900 degree F days. Based on the subgrade soil type and mean annual freezing index, the anticipated mean annual frost penetration depth is 36 inches. Traffic is anticipated to consist of primarily cars and light trucks.

Based on the above, we recommend a minimum total pavement section thickness of approximately 60% of the mean annual frost penetration or approximately 21 inches. We further recommend that the pavement section consist of the following materials.

PAVEMENT SECTION MATERIALS AND THICKNESSES		
Material	**Thickness (in)**	**Specification**
Asphalt Binder Course	3	MDOT 703.09, Type 19 mm
Base Soil	3	MDOT 703.06, Type A
Subbase Soil	15	MDOT 703.06, Type D

Where fill is required beneath the subbase soil it should consist of FB as described in Section 5.2 above. We recommend that FB, base soil, and subbase soil be compacted to a minimum of 95% of ASTM D1557.

Based on the subsurface data, pavement underdrains are not necessary at this site.

5.5 Groundwater Control

Based on observed groundwater levels, groundwater ranges from elevation 3 to elevation 5 feet. This is well below the footings and underdrains are therefore not strictly necessary. It is generally good practice to install

perimeter underdrains to account for surface water infiltration and unanticipated changes in local and regional hydrogeology. If perimeter underdrains are used they should consist of 4 inch rigid perforated PVC placed adjacent to the exterior footings and surrounded by a minimum of 6 inches of crushed stone wrapped in filter fabric to prevent clogging from the migration of the fine soil particles in the foundation backfill soils. The underdrain pipe should be outlet to a location where it will be free flowing. Where exposed at the ground surface, the ends of pipes should be screened or otherwise protected from entry and nesting of wildlife, which could cause clogging.

We also recommend exterior grades slope away from the buildings to reduce runoff water from infiltrating the foundation backfill soils.

5.6 Exterior Retaining Walls

We recommend that the segmental block retaining wall be designed by a qualified Maine Licensed P.E.

All topsoil, loose soil, or organic soil should be removed entirely from within the proposed retaining wall footprint prior to construction of leveling pad. We anticipate that the retaining wall will be constructed on existing fill or the native glaciomarine fan deposit. We recommend that the leveling pad consist of a minimum 12" thick layer of ¾" crushed stone. A woven geotextile fabric (such as Mirafi 600X) should be placed beneath the crushed stone. We recommend that the exposed soil beneath the leveling pad be proof rolled prior to placing the crushed stone. Proofrolling should consist of making a minimum of 4 passes using a vibratory plate compactor with a minimum weight of 2 tons. Any loose, wet, non-mineral, or otherwise unsuitable soil should be removed in its entirety and replaced with ¾" crushed stone prior to installing the leveling pad.

Segmental block retaining walls should be designed in accordance with the National Concrete Masonry Association (NCMA), 3rd Edition design manual. We recommend that the walls be designed using a minimum live load surcharge of 100 psf for construction and for vehicular traffic behind the wall, as applicable.

Retaining wall backfill for gravity retaining walls and reinforced soil for geogrid reinforced retaining walls should consist of Structural Fill (SF, see table below) and be compacted to 95% of its maximum dry density in accordance with ASTM D1557. The portion of SF passing the 3" sieve shall meet the following gradation requirements:

STRUCTURAL FILL (SF)	
Sieve Size	**Percent finer**
3 inch	100
½ inch	35 to 80
¼ inch	25 to 65
No. 40	0 to 30
No. 200	0 to 7

Reference: MDOT Specification 703.06, Type D

The maximum particle size should be limited to 4 inches. Structural Fill should be placed in 12" loose lifts and should be compacted to a minimum of 90 percent of its maximum dry density, determined in accordance with ASTM D1557.

Soil properties presented in the table below can be used in the retaining wall design:

DESIGN PARAMETERS – SEGMENTAL BLOCK WALLS				
Soil Type	**Soil Description**	**Unit Weight**	**Shear Strength**	
			ϕ'	**Cohesion**
Foundation	Proof rolled Existing Fill or Glaciomarine Fan	125 pcf	32°	0 psf
Retained (Gravity)	Structural Fill (MDOT 703.06, Type D)	135 pcf	34°	0 psf
Reinforced (Geogrid)	Structural Fill (MDOT 703.06, Type D)	135 pcf	34°	0 psf

The selection of parameters used in the wall design are the responsibility of the wall designer.

The retaining walls can be designed using an allowable net bearing pressure of 3,000 psf assuming the recommendations above are followed. Since segmental blocks are tolerable of some differential settlement, the blocks do not need to be constructed to full frost depth.

An underdrain system should be provided continuously behind the retaining wall near its base to prevent the buildup of hydrostatic pressures. The underdrain should consist of 6" rigid perforated PVC surrounded by a minimum of 6 inches of ¾" crushed stone and filter fabric to prevent clogging from the migration of the fine soil particles in the foundation backfill soils. The underdrain should outlet at the ends of the wall, at the low points of the wall, and through the face of the wall at a maximum spacing of 50 ft. center-to-center. Underdrains should outlet to a location where the water will be free flowing and should be protected from nesting animals.

We recommend that a ¾" crushed stone column, with a minimum thickness of 12", be installed behind the entire wall between the back of the concrete and the wall backfill to allow for any infiltrated water behind the wall to drain down to the underdrain pipe. No geotextile is required between the crushed stone and the retaining wall backfill. We recommend that geotextile, such as Mirafi 180N, be installed on the face of the cut slopes between the native soil and the retaining wall backfill.

We recommend that the final wall design be made available for SGS to review prior to construction.

6.0 Earthwork Considerations

6.1 Excavations and Slope Stability

The table below summarizes the OSHA general excavation guidelines for occupied excavations for the soils encountered in our geotechnical explorations.

OSHA Excavation Slopes		
Soil	**OSHA Classification**	**Permissible Slope**
Existing Fill	Type C	1.5H:1V
Native Glaciomarine Fan	Type B	1H:1V
Silty Clay	Type B	1H:1V

The above permissible slopes are for soil above the groundwater table. If any excavated soil is found to be below the groundwater table and is not de-watered, the permissible slope for the submerged soil is 1.5H to 1V. Any excavations greater than 20 feet deep should be designed by a qualified Maine Licensed Professional Engineer.

A global stability analysis was performed for static conditions at a deep cut section at the northeast corner of the parking garage. Three conditions were analyzed: Case 1) cut slope with no retaining wall, Case 2) cut slope with geogrid reinforced retaining wall, and Case 3) cut slope with gravity retaining wall. The stability analyses were performed using the SLIDE 2018 computer program and the Spencer method. The results of the analyses are summarized in the table below.

RESULTS OF SLOPE STABILITY ANALYSES	
Condition	**Safety Factor**
Open Cut Face - 2H:1V	1.55
Gravity Retaining Wall	1.55
Geogrid Reinforced Retaining Wall	1.60

Based on the results of these analyses, the maximum safe permanent grade of open cuts is 2H:1V. Our global stability analyses indicate that both gravity and geogrid reinforced retaining walls will be stable.

6.2 Handling and Reuse of Existing Soil.

Based on the results of the grain size analysis, the vast majority of the existing fill soil will meet the requirements for FB but will not meet the requirements for SF. A grain size analysis was not performed on the glaciomarine fan deposit. We anticipate that the majority of this deposit will also be usable as FB. We recommend that grain size analyses be performed on representative samples of the existing soil at the site to confirm compliance to the specifications in this report prior to their use.

SGS did not perform an environmental assessment on the existing fill soil. We did not observe contaminated soils with the exception of a thin layer of ash at or near the existing ground surface. Where possible we recommend that excess fill be used at the site. SGS can work with the Contractor and Owner to find potential places to use these materials on site, depending on their characteristics. Requirements for handling of contaminated soil should be determined by a qualified environmental consultant.

6.3 Earthwork Monitoring.

SGS should be notified so that we can make observations of the footing subgrade soil (existing fill) for both the CBOC and parking garage buildings prior to the placement of footing or geotextile and crushed stone.

We recommend that a qualified geotechnical consultant be retained to monitor and test soil materials used during construction and confirm that soil conditions and construction methods are consistent with this report.

7.0 Closure

Our recommendations are based on professional judgment and generally accepted principles of geotechnical engineering and project information provided by others. Some changes in subsurface conditions from those presented in this report may occur. Should these conditions or the proposed development differ from those described in this report, SGS should be notified so that we can re-evaluate our recommendations.

It is recommended that this report be made available in its entirety to contractors for informational purposes and be incorporated in the construction Contract Documents.

We appreciate the opportunity to serve you during this phase of your project. If there are any questions or additional information is required, please do not hesitate to call.

Sincerely yours,
Summit Geoengineering Services, Inc.

William M. Peterlein, PE
President & Principal Engineer

KEY TO NOTES & SYMBOLS
Test Boring and Test Pit Explorations

Stratification lines represent the approximate boundary between soil types and the transition may be gradual.

Key to Symbols Used:

w	-	water content, percent (dry weight basis)
q_u	-	unconfined compressive strength, kips/sq. ft. - laboratory test
S_v	-	field vane shear strength, kips/sq. ft.
L_v	-	lab vane shear strength, kips/sq. ft.
q_p	-	unconfined compressive strength, kips/sq. ft. – pocket penetrometer test
O	-	organic content, percent (dry weight basis)
W_L	-	liquid limit - Atterberg test
W_P	-	plastic limit - Atterberg test
WOH	-	advance by weight of hammer
WOM	-	advance by weight of man
WOR	-	advance by weight of rods
HYD	-	advance by force of hydraulic piston on drill
RQD	-	Rock Quality Designator - an index of the quality of a rock mass.
γ_T	-	total soil weight
γ_B	-	buoyant soil weight

Description of Proportions:

Trace:	0 to 5%
Some:	5 to 12%
"Y"	12 to 35%
And	35+%
With	Undifferentiated

Description of Stratified Soils

Parting:	0 to 1/16" thickness
Seam:	1/16" to 1/2" thickness
Layer:	½" to 12" thickness
Varved:	Alternating seams or layers
Occasional:	one or less per foot of thickness
Frequent:	more than one per foot of thickness

REFUSAL: **Test Boring Explorations** - Refusal depth indicates that depth at which, in the drill foreman's opinion, sufficient resistance to the advance of the casing, auger, probe rod or sampler was encountered to render further advance impossible or impracticable by the procedures and equipment being used.

REFUSAL: **Test Pit Explorations** - Refusal depth indicates that depth at which sufficient resistance to the advance of the backhoe bucket was encountered to render further advance impossible or impracticable by the procedures and equipment being used.

Although refusal may indicate the encountering of the bedrock surface, it may indicate the striking of large cobbles, boulders, very dense or cemented soil, or other buried natural or man-made objects or it may indicate the encountering of a harder zone after penetrating a considerable depth through a weathered or disintegrated zone of the bedrock.

APPENDICES

Appendix A – Summary Checklist for Inspection and Maintenance

Appendix B – Inspection Logs

Appendix C – Stormwater Drainage System Maintenance Agreement

Appendix D – Permits for Project

I. INTRODUCTION

Runoff from developed areas may contain a number of contaminants especially when emanating from rooftops, paved or lawn areas. This runoff can contain a significant amount of non-point contaminants, which can have an adverse impact on the receiving waters. The installation of wet ponds, many times combined with soil media filters, vegetated buffer strips and other stormwater best management practices can significantly reduce the non-point pollution discharge from the developed area.

The effectiveness of BMP's and other components of the system are dependent on their upkeep and maintenance to assure they meet their design function over an extended period of years. It is critical that the stormwater management facilities are inspected on a regularly scheduled basis, and that maintenance is performed on an as needed basis. It must also be recognized that the effectiveness of these facilities, and their maintenance requirements, are related to the stormwater drainage facilities that transport the flow to the outlets or treatment measures. Thus, maintenance should be directed to the total system, not just the BMP's.

The purpose of this document is to define in detail the inspection and maintenance requirements deemed necessary to assure that the stormwater management facilities function as intended on a long-term basis for the VA Clinic development. This Operations and Maintenance Manual is specific to the proposed stormwater measures utilized to execute a successful stormwater management plan. Subsequent sections identify individual maintenance items; give a brief commentary of the function and need of the item, a description of the work required, and a suggested frequency of accomplishment. While the suggested programs and schedules must be adapted to specific projects, the material presented should provide guidance for a successful long-term program.

A. Guidelines Overview

A summary of the individual components of stormwater management facilities for this project has been prepared. The format used in the summary is as follows:

Preface: A general description of what function/benefit the element is intended to provide. This is a short summary and not intended to provide the design basis, which can be found in other sources.

Inspection: This section provides the inspection requirements for the individual component.

Maintenance: The section provides general information on the routine maintenance requirements of this element.

Frequency: This section outlines the best judgment of the designer on the system to the frequency of maintenance.

Comments: This section provides any particular comment on the site-specific features of this element. This is a summary only. The owner/operator should review the design drawings and documents carefully to understand the particular elements of the project.

The end of this section should allow the owner/operator to make notes on the specific program. This may include the selected maintenance procedure, cross-references to applicable design drawings, etc.

A list of the individual inspection/maintenance elements is provided in the table of contents. The guidelines are proposed for initial use with adjustments made as appropriate based upon specific project experience.

This report includes the Operation and Maintenance requirements for any potential BMP identified in the Stormwater Management Report for this project.

B. Responsible Party

The responsible party for operation and maintenance of the stormwater and other site infrastructure will be the applicant or their agents or assigns. A copy of an unexecuted Stormwater Drainage System Maintenance Agreement is included in Appendix C.

II. PROJECT OVERVIEW

Key permits issued (or applied for) on the project include:

- City of Portland Level III Site Plan Approval
- Maine Construction General Permit Stormwater General Permit

A copy of the permits and Stormwater Management Report should be appended to this manual as Appendix D. The Owner/Operator of the stormwater management system should review these permits for a general description and background of the project, as well as any specific permit conditions or requirements of the project.

The applicant has retained Gorrill Palmer for civil engineering for the development project. Gorrill Palmer has prepared the design for the stormwater management facilities and may be contacted at:

Gorrill Palmer
707 Sable Oaks Drive – Suite 30
South Portland, Maine 04106
207.772.2515

The applicable plans and design documents which apply to the project are:

1. Civil Site Plans Prepared by Gorrill Palmer
2. The Erosion Control/Sedimentation Control Plan for the project
3. The Stormwater Management Plan for the project

A copy of these documents should be retained with this manual.

The proposed design includes inlets, stormwater conveyance lines, porous pavement, a subsurface sand filter, a filter cartridge, and an outlet control structure.

The key receiving waters for this project is the Fore River that is located south of the project site.

The manual is intended for general guidance; however, any substituted deviations from the manual should be reviewed with respect to provisions of Appendix D.

III. STANDARD INSPECTION/MAINTENANCE DESCRIPTIONS

The following narratives describe the inspection/maintenance provisions for the Stormwater Management system. These O&M procedures will complement scheduled vacuuming of the parking spaces which is anticipated to occur at least twice per year. Proper O&M is necessary to make sure the system will provide its intended purpose of conveying runoff, removing a substantial amount of the suspended solids, and other contaminants in the stormwater runoff. Routine vacuuming of the porous areas is critical to their successful functioning.

A. Stormwater Inlets

Preface: The success of any stormwater facility relies on the ability to intercept stormwater runoff at the design locations. Stormwater inlets include catch basins, open culverts, and field inlets. A field inlet exists in the FocalPoint® as an overflow structure. Several catch basins are located at the base of the northern cut slope.

Inspection: The inspection of inlet points will need to be coordinated with other maintenance items, these include:

- Building maintenance areas
- Grounds maintenance

The key elements of the inspection are to assure the inlet entry point is clear of debris and will allow the intended water entry.

Maintenance: The key maintenance is the removal of any blockage which restricts the entry of stormwater to the inlet. The removed material should be taken out of the area of the inlet and placed where it will not reenter the runoff collection system. Snow should be removed from inlets near the sidewalk areas. Grass clippings and leaves should be bagged and removed particularly near the yard inlets near the buildings.

Frequency: All inlets should be inspected on a quarterly basis, and after/during significant storm events i.e. >1" rainfall).

Maintenance Personnel: The maintenance personnel will perform the normal maintenance/ inspections of the inlets and tributary drainage system.

Comments: Maintenance of inlets is critical on this project.

B. Tributary Drainage System

Preface: Stormwater from most of the project will be directed through filters and into a conveyance (tributary) system which transports the flow to the main point of discharge after.

This conveyance system will be principally overland flow discharging to piped drain systems. Most of the sediment carried by the drainage system is intended to be trapped in pretreatment devices and structures. Maintenance of this system can play a major role in the long-term maintenance costs and the effectiveness of the onsite systems. The primary pretreatment measure for the VA Clinic site will be through deep sumped catch basins with hooded outlets.

Inspection: The tributary drainage system should be periodically inspected to assure that it is operating as intended, and that the carrying capacity has not been diminished by accumulations of debris and sediment or other hydraulic impediments. On piped systems, the inlets must be inspected to ensure the rims are set at the proper elevation to optimize flow entry and are not clogged with debris.

The level of sediment in the sumps should be checked to assure their effectiveness. Pipelines connecting the inlets should be checked to determine if siltation is occurring. This will be most critical on drain lines laid at minimal slopes. This can usually be accomplished by a light and mirror procedure.

Maintenance: Maintenance of the storm drainage system must assure that it continues to serve its design function on a long-term basis, and that its operation does not transport excessive sediments to any downstream treatment device or the receiving waters. Elevations on the rim of catch basins should be adjusted as needed to assure optimal water entry. Depending on the frost susceptibility of the soil, the rims may become elevated over time causing flow to circumvent the inlet. If a temporary filter bag has been designated for the inlet during construction, silt or other deleterious materials, can significantly reduce capacity and the bags should be removed with the sediment and replaced during construction. Catch basin cleaning would normally be accomplished with vacuum trucks contracted as a maintenance service for the Development. The removed material must be disposed of at an approved site for such materials.

If sediment in the pipeline is observed, it should be removed. This may be accomplished by hydraulic flushing, or by mechanical means. If hydraulic flushing is used the downstream conditions should be analyzed.

Frequency: The tributary drainage system should be inspected on an annual basis. Adjustment of inlet rim elevations should be on an as needed basis. Cleaning catch basin sumps and pipelines will depend on the rate of accumulation.

C. Porous Pavement

Preface: The porous pavement collects stormwater runoff from the surface before passing it through a treatment section and discharging into a closed drainage system.

Inspection/Monitoring: The pavement should be inspected regularly to ensure that the surface is not clogged, and that runoff can pass freely through the porous section. The asphalt surface must be inspected for integrity and to ensure rutting or deformation of the surface is minimized.

Maintenance: Any debris should be removed from the pavement surface. If the porous pavement area is holding water in excess of 48-72 hours, corrective action is needed. To correct a standing water problem, the following remedial actions are recommended.

1. Vacuum any sediment or debris from the pavement surface on a semi-annual basis.
2. Ensure the underdrain system or outlet pipe orifice is not clogged with any silt or other materials.
3. Ensure that the porous pavement can pass water freely or drain quickly while handling large amounts of water.

Frequency: The porous pavement should be inspected and vacuumed semi-annually and maintained as necessary.

Maintenance/Inspection Responsibility: The Owner or an outside agent is responsible for inspection and maintenance of the porous pavement areas

Comments: Proper maintenance is critical for the porous pavement as it plays a large role in the overall stormwater management plan for the development.

D. Subsurface Sand Filter

Preface: The subsurface sand filter is a sand filter layer with storage above underneath a typical section for the applicable surface treatment. Stormwater runoff is conveyed to the filter through a closed pipe system from surface runoff and roof drains.

Inspection: The subsurface sand filter will have control structures and maintenance ports to inspect the pretreatment row and storage layer. Inspect system to see if runoff is draining through the system at the outlet and inlet devices. Visual inspections should also occur after large storm events (i.e. >1").

Maintenance: The procedures for maintenance are as follows:

- *Inlets and Outlets*
  Inlets and outlets to the subsurface sand filter should be kept open and in good working condition. This is particularly important for the inlet at the pretreatment rows. Outlets should be cleared and, if necessary flushed of any build-up.

- *Storage Layer*
  Remove and dispose of any sediment and build-up in the storage layer.

- *Sedimentation (or Clogging) of Soil Filter Area*
  If the sand filter appears to be holding water for a period longer than 48-72 hours, the sand mix has, more than likely, become clogged with sediment and/or the underdrains have clogged. To correct a standing water problem, the following remedial actions are recommended:

1. Evaluate the drainage area to the sand filter area to identify any potential sources of sediment, such as an erosive condition, that may be contributing to the clogging of the device. If a source is identified, it is recommended that that source be eliminated to the fullest extent practicable before proceeding with the remaining recommendations provided below.
2. Flush the underdrains. Use cleanouts to flush the underdrains. Sediment in the drains may be preventing the sand filter from draining. Make sure to provide a way to capture any flushed sediment before it enters the stream environment or storm drain system downstream of the device. If, after flushing the underdrains, the device continues to hold water, the sand filter may be contaminated and need to be replaced.

Frequency: The subsurface sand filter should be inspected semi-annually and maintained as necessary.

Comments: Pretreatment in catch basin sumps and pretreatment row is crucial to long-term function of sand filter.

E. Proprietary Treatment Devices (FocalPoint®)

Preface: A FocalPoint® system will be used on site to treat surface runoff from impervious and landscaped area

Inspection: Inspection of the filter should be performed after each major rainfall event to ensure that stormwater runoff is able to pass through the filters. The vegetation should be inspected and maintained regularly similar to other landscape features on site. The underdrain outlet should be inspected regularly.

Maintenance: Clear inlets and pretreatment devices of debris and sediment. Maintain as instructed by manufacturer.

Frequency: The system should be inspected semi-annually and maintained as required by the manufacturer.

Comments: The manufacturer typically commits to the first year of maintenance if their strict guidelines are followed for installation, which is highly encouraged to achieve peak performance. It is recommended that an outside agent who is familiar with the product be retained for future maintenance.

F. Proprietary Treatment Devices (Filter Cartridge)

Preface: A filter cartridge will be installed in a catch basin in the loading dock well.

Inspection: Inspection of the filters should be performed after each major rainfall event to ensure that stormwater runoff is able to pass through the filters.

Maintenance: Clear the grate of debris. Ensure the filter is passing runoff freely, or at the specified rate. A standard cartridge should last a minimum of one year depending on the cartridge used. Maintain as instructed by manufacturer.

Frequency: The filter should be inspected semi-annually and maintained as required by the manufacturer.

Comments: An outside agent who is familiar with the product should be retained for maintenance of the product.

G. Orifice Control Devices

Preface: Orifices of assorted sizes are commonly utilized to control discharge from stormwater management features. This project uses orifice controls to control discharge from the porous pavement area and the subsurface sand filter.

Inspection: Inspection of orifices should be performed after each major rainfall event to ensure that stormwater runoff is able to discharge through the orifice and that it is not clogged.

Maintenance: The orifice cap should be removed and all debris flushed from the pipe prior to reinstalling the orifice cap. An orifice in a weir wall should be cleared of debris by hand.

Frequency: The orifice control devices should be inspected semi-annually and maintained as needed.

Comments: None.

H. Litter

Litter should be removed as a matter of course by workers and as part of the ground's maintenance contract.

IV. PROGRAM ADMINISTRATION

A. General

A reliable administrative structure must be established to assure implementation of the maintenance programs described in the foregoing section. Key factors that must be considered in establishing a responsive administrative structure include:

1. Administrative body must be responsible for long-term operation and maintenance of the facilities. (Maintenance continues for the lifespan of the development in accordance with this document)

2. Administrative body must have the financial resources to accomplish the inspection and maintenance program over the life of the facility.

3. The administrative body must have a responsible administrator to manage the inspection and maintenance programs.

4. The administrative body must have the staff to accomplish the inspection and maintenance programs or must have authority to contract for the required services.

5. The administrative body must have a management information system sufficient to file, retain, and retrieve all inspection and maintenance records associated with the inspection and maintenance programs.

6. A qualified post construction inspector shall be retained by the Owner. His/her duties shall include preparing schedules for the Owner's maintenance, summarizing the results of this maintenance and preparing an annual report on the operation, maintenance, and repair of the stormwater system which must be copied to the City. (The Owner shall be responsible for retaining a separate entity to perform maintenance which cannot be performed by the management of building and property grounds.) This person shall also participate in troubleshooting of the stormwater management system if a problem develops.

If any of the above criteria cannot be met by the entity assigned inspection and maintenance responsibilities, it is likely that the system will fail to meet its water quality objectives at some point during its life. While each of the above criteria may be met by a variety of formats, it is critical to clearly establish the assigned administrative body in a responsible and sustainable manner.

B. Record Keeping

Records of all inspections and maintenance work accomplished must be kept and maintained to document facility operations. These records should be filed and retained for a minimum 5-year time span. The filing system should be capable of ready retrieval of data for periodic reviews by appropriate regulatory bodies. Where possible, copies of such records should also be filed with the designated primary regulatory agency for their review for compliance with permit conditions. Typical inspection and maintenance record forms are attached hereto as Appendix B.

Beyond the initial 5-year time span of the original approval and maintenance plan, the stormwater management system will need to be recertified through the Department every 5 years to confirm that there is conformance with the original permit documents. This process will ensure all systems function properly over time. This document will remain valid throughout any subsequent recertification processes.

C. Contract Services

In some instances, or at specific times, the Maintenance Personnel may not have the staff to conduct the required inspection and/or maintenance programs as outlined in this document. In such cases, the work should be accomplished on a contractual basis with a firm or organization that has the staff and equipment to accomplish the required work.

The service contract for inspection and maintenance should be formal, well-written legal document which clearly defines the services to be provided, the contractual conditions that will apply, and detailed payment schedules. Liability insurance should be required in all contracts.

APPENDIX A

Summary Checklist
Inspection and Maintenance

Stormwater Management System Maintenance Program Summary Checklist						
Item	**Commentary**	**Frequency**				
		Monthly	**Quarterly**	**Semi-Annual**	**Annual**	**Long Term**
Stormwater Inlets	Stormwater inlets allow flow entry from a surface swale to a piped system. Inspect entry for debris accumulation. Remove debris to allow unimpeded entry. Lawn clippings and leaves should be removed from yard areas.		X		X Clearing	
Tributary Drainage System	Inspect to assure that the carrying capacity has not been diminished by debris, sediment or other hydraulic impediments.				X	
Porous Pavement	Inspect after storm events >1" to ensure the pavement is not plugged with debris. Vacuum semi-annually.			X		X
Subsurface Sand Filter	Inspect maintenance ports after rain events >1" and remove sediment. Check for signs of clogging and flush underdrains if necessary.			X		X
Proprietary Device (FocalPoint®)	Filters should be inspected semi-annually and maintained as needed. **Snow Storage within the filter should be prohibited by Maintenance Personnel.**			X		
Proprietary Device (Filter Cartridge)	Filters should be inspected semi-annually and maintained as needed. **Snow Storage within the filter should be prohibited by Maintenance Personnel.**			X		
Orifice Control Devices	Inspect after major storm events and clear debris from orifice. May require flushing of pipes.			X		
Litter	Litter should be removed daily.					

APPENDIX B

Sample Inspection Logs

VA CLINIC
PORTLAND, MAINE

STORMWATER MANAGEMENT
SAMPLE STORMWATER INSPECTION & MAINTENANCE LOG

This log is intended to accompany the Operation and Maintenance Manual for Stormwater Management and Related Facilities. All stormwater BMPs shall be maintained in effective operating condition. A person with knowledge of erosion and stormwater control, including the standards and conditions of the DEP Stormwater Permit, shall conduct inspections of the facilities as described in the O&M Manual and on this form, and identified deficiencies must be corrected. This log shall be kept on file for a minimum of five (5) years.

A. General Information			
Project Name:		**Inspection Date:**	
Parcel/Lot:		**Current Weather:**	
BMP Owner:		**Date/Amount Last Precip.:**	
Owner Mailing Address:		**Inspection Company:**	
Owner Phone #:		**Inspection Co. Mailing Address:**	
Owner Email:		**Inspector Name:**	
		Inspector Phone #:	
		Inspector Email:	

B. Stormwater Inlets	**Observations**
Frequency: Annually in the spring	
Accumulated sediments from inflow channels and pipes between basins have been removed and legally disposed of	☐ Yes ☐ No ☐ NA
Floating debris and large sediment particles have been removed from inlets.	☐ Yes ☐ No ☐ NA
Stormwater Inlet Notes:	

C. Tributary Drainage System	**Observations**
Frequency: Annually spring or late fall and after heavy rains	
Remove and legally dispose of sediments	☐ Yes ☐ No ☐ NA
Remove floatables and other objects	☐ Yes ☐ No ☐ NA
Check for overgrown vegetation impeding flow	☐ Yes ☐ No ☐ NA
Check pipelines for siltation and clogging	☐ Yes ☐ No ☐ NA
Repair any slumping side slopes or erosion	☐ Yes ☐ No ☐ NA
Replace any riprap on areas where any underlying fabric or underlying gravel is exposed.	☐ Yes ☐ No ☐ NA
Tributary Drainage System Notes:	

D. Porous Pavement	Observations
Frequency: Semi-Annually	
Vacuum any sediment and debris from pavement surface	☐ Yes ☐ No ☐ NA
Check that underdrain system is functioning properly	☐ Yes ☐ No ☐ NA
Check for pooling or signs that pavement is clogged and doesn't pass water	☐ Yes ☐ No ☐ NA
Porous Pavement Notes:	

E. Subsurface Sand Filter	Observations
Frequency: Semi-annually	
Check that inlets are clear and flow into pretreatment row is not obstructed	☐ Yes ☐ No ☐ NA
Inspect maintenance ports and clear debris or buildup	☐ Yes ☐ No ☐ NA
Check for signs of clogging, or water is not draining within 48-72 hours	☐ Yes ☐ No ☐ NA
Bio-Retention Filters Notes:	

F. Orifice Control Devices	Observations
Frequency: Semi-Annually	
Check for debris blocking orifice	☐ Yes ☐ No ☐ NA
If applicable, flush underdrain pipe	☐ Yes ☐ No ☐ NA
Orifice Control Devices Notes:	

G. Proprietary Device (FocalPoint®)	Observations
Frequency: Semi-Annually	
Check for debris blocking orifice	☐ Yes ☐ No ☐ NA
Check overflow structure and clear debris	☐ Yes ☐ No ☐ NA
Check for signs of clogging, or water is not draining freely through filter media	☐ Yes ☐ No ☐ NA
If applicable, flush underdrain pipe	☐ Yes ☐ No ☐ NA
Proprietary Device Notes:	

H. Proprietary Device (Filter Cartridge)	Observations
Frequency: Semi-Annually	
Check for debris blocking orifice	☐ Yes ☐ No ☐ NA
Check for signs of clogging and that runoff is passing freely or at specified rate	☐ Yes ☐ No ☐ NA
Proprietary Device Notes:	

APPENDIX C

Stormwater Drainage System Maintenance Agreement

STORMWATER DRAINAGE SYSTEM
MAINTENANCE AGREEMENT

VA Community Based Outpatient Clinic and Park Garage at 113 West Commercial Street

IN CONSIDERATION OF the site plan approval granted by the Planning Board of the City of Portland to the proposed Community Based Outpatient Clinic and Parking Garage Project ID PL-000927-2019 shown on the Site Layout Plan submitted by Gorrill Palmer Consulting Engineers and associated Grading, & Drainage Plan (Exhibits A and B) prepared by Gorrill Palmer Consulting Engineers of 707 Sable Oaks Drive, South Portland, Maine dated last revised _____ and pursuant to a condition thereof, FDS JBB Portland LLC, a Maine limited liability company with a principal place of business in Portland, Maine, and having a mailing address of c/o FD Stonewater, LLC 1001 19th Street North, Suite 1401, Arlington VA 22209, the owner of the subject premises, does hereby agree, for itself, its successors and assigns (the "Owner"), as follows:

Maintenance Agreement

That it, its successors and assigns, will, at its own cost and expense and at all times in perpetuity, maintain in good repair and in proper working order the porous pavement systems, Subsurface sand filter systems, Roof drains and loading dock drain Filter Cartridge system, Oil-Water Separator and related onsite drainage infrastructure, (hereinafter collectively referred to as the "stormwater system"), as shown on the Grading, & Drainage Plan in Exhibit B and in strict compliance with the approved Stormwater Inspection and Maintenance Manual prepared for the Owner by Gorrill Palmer Consulting Engineers (copy attached in Exhibit C) and Chapter 32 of the Portland City Code.

Owner of the subject premises further agrees, at its own cost, to keep a Stormwater Maintenance Log. Such log shall be made available for inspection by the City of Portland upon reasonable notice and request.

Said agreement is for the benefit of the said City of Portland and all persons in lawful possession of said premises and abutters thereto; further, that the said City of Portland and said persons in lawful possession may enforce this Agreement by an action at law or in equity in any court of competent jurisdiction; further, that after giving the Owner written notice and a stated time to perform, the said City of Portland, by its authorized agents or representatives, may, but is not obligated to, enter upon said premises to maintain, repair, or replace said stormwater system in the event of any failure or neglect thereof, the cost and expense thereof to be reimbursed in full to the said City of Portland by the Owner upon written demand. Any funds owed to the City under this paragraph shall be secured by a lien on the property.

This Agreement shall also not be construed to allow any change or deviation from the requirements of the subdivision and/or site plan most recently and formally approved by the Planning Board of the City of Portland.

This agreement shall bind the undersigned only so long as it retains any interest in said premises, and shall run with the land and be binding upon the Owner's successors and assigns as their interests may from time to time appear.

The Owner agrees to record a copy of this Agreement in the Cumberland County Registry of Deeds within thirty (30) days of final execution of this Agreement. The Owner further agrees to provide a copy of this Agreement to any successor or assign and to forward to the City an Addendum signed by any successor or assign in which the successor or assign states that the successor or assign has read the Agreement, agrees to all its terms and conditions and the successor or assign will obtain and forward to the City's Department of Public Services and Department of Planning and Urban Development a similar Addendum from any other successor or assign.

For the purpose of this agreement and release "Owner" is any person or entity who is a successor or assign and has a legal interest in part, or all, of the real estate and any building. The real estate shown by chart, block and lot number in the records on file in the City Assessor's office shall constitute "the property" that may be entered by the City and liened if the City is not paid all of its costs and charges following the mailing of a written demand for payment to the owner pursuant to the process and with the same force and effect as that established by 36 M.R.S.A. §§ 942 and 943 for real estate tax liens.

Any written notices or demands required by the agreement shall be complete on the date the notice is attached to one or more doors providing entry to any buildings and mailed by certified mail, return receipt requested or ordinary mail or both to the owner of record as shown on the tax roles on file in the City Assessor's Office.

If the property has more than one owner on the tax rolls, service shall be complete by mailing it to only the first listed owner. The failure to receive any written notice required by this agreement shall not prevent the City from entering the property and performing maintenance or repairs on the stormwater system, or any component thereof, or liening it or create a cause of action against the City.

ENVIRONMENTAL AND LANDSCAPE FEATURES

The following statements are provided in accordance with the Section 14-526 of the ordinance.

(b) Environmental Quality Standards

Preservation of Significant Natural Features (14-526 (b) 1), if applicable

- *Trees, plants, habitats listed on State or Federal list of endangered or threatened*
- *High and moderate value waterfowl and wading habitat*
- *Aquifers on Casco Bay Islands*
- *Waterbodies (including wetlands, watercourses, significant vernal pools and floodplains)*
- *Proposed preservation areas and protection measures*
- *Documentation from environmental consultants, determinations from applicable state agencies*

1. *Preservation of Significant Natural Features:*

   - In 2015, Rich Jordan, then of TRC Solutions completed an onsite investigation to identify wetlands or vernal pools that might exist on the site. He did not identify any of these features on the property. A copy of his December 17, 2015 letter outlining this finding accompanies this narrative.

     The existing site was historically used as a railyard among other land uses. The site is currently vacant and contains some low-level vegetation and sparse tree coverage within the development area. The steeper slopes at the rear of the property are also covered with ground cover and shrub vegetation. The owner cut larger trees on the slopes several years ago, to discourage transient use and encampments.

   - The site does not contain any population of trees or plants that are on the official list of endangered and threatened plans in Maine. Nor does the site contain any habitat for endangered or threatened species, high or moderate value waterfowl and wading bird habitat or significant wetlands or vernal pools.

Landscaping and Landscape Preservation (14-526 (b) 2 a)

- *Preservation of trees and preservation within required zoning setbacks (Technical Manual, Section 4)*
- *Protection measures of existing vegetation during construction*
- *Protection measures within Shoreland Zone, if applicable*

2. *Landscaping and Landscape Prevention:*

   a. *Landscape Preservation.*

      (i) The existing tree coverage within the development area is minimal and does not warrant protection in our opinion.

      (ii) Not applicable as the maximum front yard setback is 10'. Existing vegetation on the steeper slopes that will remain undeveloped will be retained.

(iii) There is no specific vegetation protection required on the site.

(iv) The Applicant will request a waiver from this standard.

(v) Not applicable.

Landscaping and Landscape Preservation (14-526 (b) 2 b i)

a. Screening and buffering of service areas and between non-residential and residential uses
b. Planting plans with plant schedule and sizes

2. Landscaping and Landscape Prevention:

b. Site Landscaping:

(i) Landscaped Buffers:

(a) The Clinic loading dock will be positioned at the rear of the building, and clear of view from the Street. A solid waste collection area will also be located at the rear of the site and it will be screened with a solid enclosure around its perimeter. The transformer pad and an emergency generator will also be located behind the building and thus screened from view of the public along the street. The existing slope and vegetation at the rear of the site will provide suitable screening from residential property along Danforth Street.

(b) The site development area will contain landscaping of the parking lot and project perimeter. A limited amount of landscaping will be provided along the building front since there is only a narrow space between the building and the street line, based on the maximum building setback provision for the B-5b zone.

(c) The applicant is requesting a waiver of these provisions due to the site topography. The residential sites to the north (rear) of the property are elevated greater than 50' above the site grades where the development activity will occur. Existing vegetation along the hillside behind the building is expected to provide sufficient screening of the proposed buildings from the residential neighbors.

(d) Not applicable.

Landscaping and Landscape Preservation (14-526 (b) 2 b ii)

Parking Lot Landscaping, if applicable

- *Landscaped islands within parking areas (Technical Manual, Section 4)*

2. Landscaping and Landscape Preservation:

a. Site Landscaping.

(ii) Parking Lot Landscaping:

a) thru d) The proposed parking lots will contain landscaping that is consistent with the City's technical standards. This landscaping will maintained in a well-manicured manner.

Street Trees (14-526 (b) 2 b iii)

- *Existing Heritage or Feature Trees on site and measures to preserve*
- *Identify street trees on the plan meeting the site plan and Technical Manual standards (Section 4) or identify alternative measures, if applicable*

2. Landscaping and Landscape Preservation:

b. Site Landscaping.

(iii) Street Trees:

(a) The site landscaping plan contains tree plantings long the front of the property, within the site and not within the Public right of way. The plans include the development of a 5' wide esplanade and the 10' wide pathway within the right of way. Unfortunately, the esplanade is generally located over the existing 115 KVA high voltage underground power transmission line and also below the overhead lines, thus the placement of trees in this zone is basically prohibited because of these conflicts. To offset these restrictions, the plan includes the tree plantings on the site.

From: Rich Jordan - TRC
(rjordan@trcsolutions.com)

Subject: Wetlands Survey – West Commercial Street, Portland, Maine

Date: 2015-Dec-17

CC: -

Barry –

As requested by your email to me on December 14, this morning I surveyed an area of land located on the north side of the west end of Commercial Street in Portland (indicated in red on Figure 1). The purpose of my visit was to review the site for the presence of wetlands, streams or potential vernal pools. There are none of these features on the property.

I will attach some photographs from my site visit to this memo. Please let me know if you need any additional information. Thanks again!

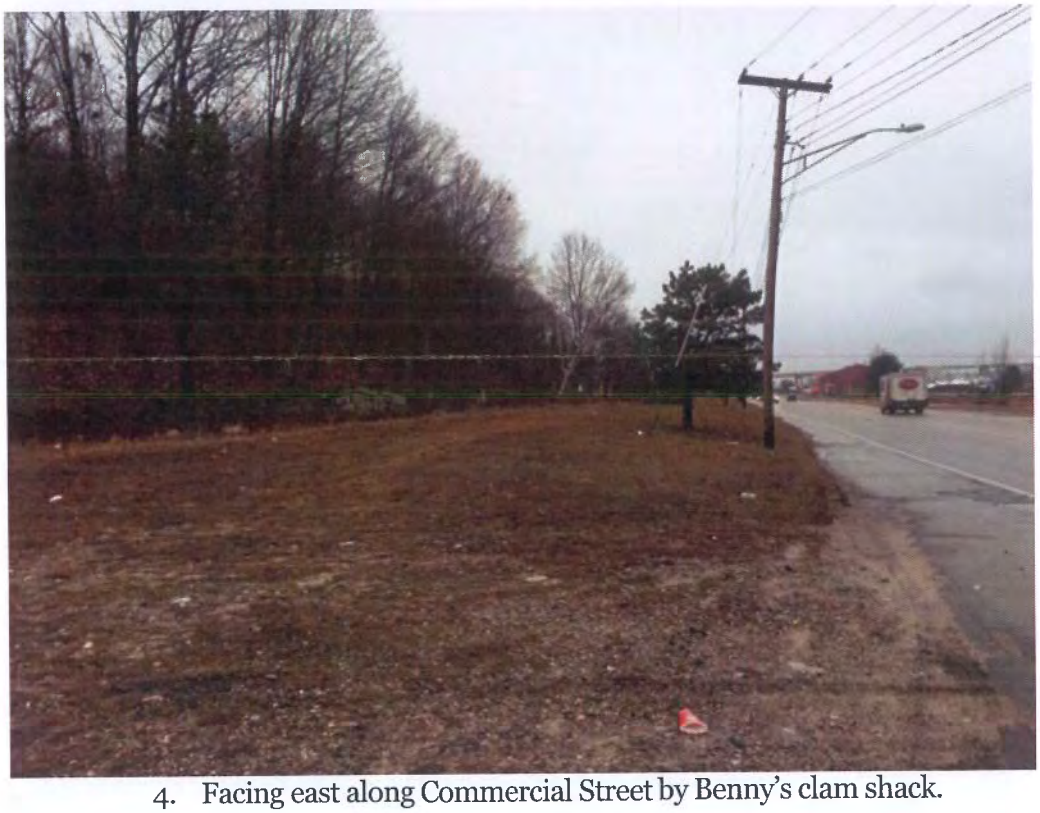
Figure 1. Survey Site on West Commercial Street, Portland.

Respectfully submitted,

Rich Jordan, PWS/CPESC

Cell: 207-317-3583 Office: 207-274-2624
Email: rjordan@trcsolutions.com

ATTACHMENT (1 - photos)



1. Facing east toward eastern end of subject area.

2. Facing north into subject area.

3. Facing west within subject area.

4. Facing east along Commercial Street by Benny's clam shack.

ENVIRONMENTAL AND STORMWATER

The following statements are provided in accordance with the submission checklist and Section 14-526 of the ordinance.

(b) Environmental Quality Standards

Water Quality, Stormwater Management and Erosion Control (14-526 (b) 3 a)

- *Stormwater report in compliance with Section 5 of Technical Manual and DEP Chapter 500 stormwater for basic, general and flooding standards, as applicable*
- *Erosion control plan and measures*
- *Evidence of compliance with Urban Impaired Stream Standards pursuant to DEP Chapter 500 stormwater, as applicable*
- *Subsurface sanitary sewage disposal and groundwater protection*

3. Water Quality, Stormwater Management and Erosion Control:

a. Stormwater:

(i) The development site does not currently contain a defined stormwater management system nor does it lie in a manner that influences offsite drainage patterns from neighboring properties, thus the proposed development is not expected to impede or otherwise cause flooding onto adjacent properties. Generally, the site conditions allow for minor absorption of runoff into the ground based on the site site's soils conditions or otherwise stormwater runoff sheets to the street and is captured within catch basins located in the street. The exact conveyance route of the existing street system is unknown and the development team is coordinating with DPW on these existing conditions. The existing 48" Fore River interceptor sewer is located along the site frontage. An existing overflow control structure is located just west of the site and that structure contains a 24" overflow pipe to the Fore River. Similarly, there is a control structure along the Interceptor opposite the Emery Street right of way and that CSO structure regulates flows to multiple overflow pipes out to the Fore River. Each of these CSO systems remains active. The site is proximate to the Fore River tidal conditions and only the Canal Landing Boat Yard is between the site and the river.

(ii) The site's stormwater runoff will be collected by several means. The proposed clinic building roof will contain drains that will tie into a subsurface chamber storage system and below grade treatment device. These systems will provide both water quality treatment and flood control

(iii) The development drainage systems will minimize impacts on the volume or rate of stormwater draining offsite. These systems will include runoff storage within the porous pavement sections of the parking lot and within underground proprietary chamber storage for building roof runoff.

(iv) The existing drainage systems within West Commercial Street are adequately sized to handle the increase in runoff volume and peak discharge.

b. Flooding Standards:

The project will ultimately meet the General Standards under Chapter 500, Stormwater Law (City of Portland Technical Manual, Section 5 – Portland Stormwater Management and MaineDEP Ch. 500, 3 (e)). The Basic Standards will apply to this project and a detailed Soil Erosion and Sediment Control Plan has been developed to address this.

c. Not applicable, not located within an Urban Impaired Stream.

d. Not applicable – not a residential development.

e. Construction at the site will be required to follow Local, State and Federal regulations and will be undertaken under the supervision of a suitably qualified environmental professional. Post-construction activities at the site do not pose a risk of groundwater contamination.

f. The project will be connected to the public sanitary sewer system which is adequately sized for the anticipated project flows.

Drawing No. C–1.0

U:\3572_VA Clinic West Commercial St-Portland, ME\Z – CAD\DWG\3572–COVER.dwg 12/5/2019 10:40 AM

GENERAL NOTES:

1. THE CONTRACTOR SHALL REFER TO THE PROJECT MANUAL FOR CONSTRUCTION SPECIFICATIONS AND BIDDING PROCEDURES.
2. THIS PROJECT WILL BE SUBJECT TO THE TERMS AND CONDITIONS OF ALL PERMITS ISSUED BY LOCAL UTILITY COMPANIES AND THE CITY OF PORTLAND.
3. THE CONTRACTOR SHALL REFER TO THE ARCHITECTURAL PLANS FOR EXACT LOCATIONS AND DIMENSIONS OF THE ENTRANCE, PAVING, PRECISE BUILDING DIMENSIONS, AND EXACT BUILDING UTILITY ENTRANCE POINTS. ENTRANCES IN MOST LOCATIONS REQUIRE STRUCTURAL SLABS. REFER TO THE ARCHITECTURAL AND STRUCTURAL DRAWINGS FOR INFORMATION ON THE STRUCTURAL SLAB ENTRANCES.
4. ALL REQUIRED AND NECESSARY INSPECTIONS AND/OR CERTIFICATIONS REQUIRED BY CODES AND/OR UTILITY SERVICE COMPANIES SHALL BE PERFORMED PRIOR TO ANNOUNCED BUILDING POSSESSIONS AND THE FINAL SERVICE CONNECTIONS.
5. THE CONTRACTOR IS SPECIFICALLY CAUTIONED THAT THE LOCATION AND/OR THE ELEVATION OF THE EXISTING UTILITIES AS SHOWN ON THESE PLANS IS BASED ON RECORDS OF THE VARIOUS UTILITY COMPANIES AND, WHERE POSSIBLE, MEASUREMENTS TAKEN IN THE FIELD. THIS INFORMATION IS NOT TO BE RELIED ON AS BEING EXACT OR COMPLETE. THE CONTRACTOR MUST CALL THE APPROPRIATE UTILITY COMPANY AND DIG SAFE AT LEAST 72 HOURS PRIOR TO ANY EXCAVATION TO REQUEST EXACT FIELD LOCATION OF UTILITIES. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO RELOCATE ALL EXISTING UTILITIES WHICH CONFLICT WITH THE PROPOSED IMPROVEMENTS SHOWN ON THE PLANS.
6. MAINTENANCE OF EROSION CONTROL MEASURES IS OF PARAMOUNT IMPORTANCE TO THE APPLICANT AND THE CONTRACTOR IS RESPONSIBLE FOR COMPLYING WITH ALL EROSION CONTROL MEASURES SHOWN ON THE PLANS. ADDITIONAL EROSION CONTROL MEASURES SHALL BE INSTALLED IF DEEMED NECESSARY BY ONSITE INSPECTIONS OF THE OWNER, THEIR REPRESENTATIVES, OR THE CITY, AT NO ADDITIONAL COST TO THE OWNER.
7. ALL MATERIAL SCHEDULES SHOWN ON THE PLANS ARE FOR GENERAL INFORMATION ONLY. THE CONTRACTOR SHALL PREPARE HIS OWN MATERIAL SCHEDULES BASED UPON HIS PLAN REVIEW. ALL SCHEDULES SHALL BE VERIFIED IN THE FIELD BY THE CONTRACTOR PRIOR TO ORDERING MATERIALS OR PERFORMING WORK.
8. ALL MATERIALS AND CONSTRUCTION METHODS SHALL CONFORM TO THE PROJECT SPECIFICATIONS, THE CITY OF PORTLAND AND SERVICING UTILITY REQUIREMENTS, IN CASES WHERE THESE CONFLICT THE MOST STRINGENT SHALL APPLY AT NO EXTRA COST TO THE OWNER.
9. THE CONTRACTOR IS RESPONSIBLE FOR MAINTAINING RECORD DRAWINGS THROUGHOUT THE PROJECT AND PROVIDING THE OWNER WITH A SET OF THE FINAL RECORD DRAWINGS WHEN THE PROJECT IS COMPLETE.
10. THE CONTRACTOR IS RESPONSIBLE FOR MAINTAINING ACCESS AT ALL TIMES. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ALL TEMPORARY MARKINGS, SIGNAGE AND INCIDENTALS TO MAINTAIN SAFE VEHICLE AND PEDESTRIAN ACCESS THROUGH OUT THE LIFE OF THE PROJECT.

SITE LAYOUT NOTES:

1. ALL HANDICAP PARKING SPACES ARE TO RECEIVE HANDICAP SIGNS AND PAVEMENT MARKINGS AS ILLUSTRATED ON THE DETAIL SHEETS.
2. BITUMINOUS CONCRETE CURB AND GRANITE CURB SHALL MEET THE REQUIREMENTS OF MDOT 702.01, 703.07, AND 609.04.
3. ALL DIMENSIONING, UNLESS NOTED OTHERWISE, IS TO THE FACE OF CURB OR THE FACE OF THE BUILDING.
4. EXCEPT WHERE INDICATED OTHERWISE, THE PAVEMENT IS TO BE STANDARD DUTY PAVEMENT.
5. ALL TRAFFIC CONTROL SIGNS INDICATED ON THE SITE LAYOUT PLAN ARE TO MEET ALL REQUIREMENTS AND STANDARDS OF THE MAINE DEPARTMENT OF TRANSPORTATION, AND THE MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES, LATEST EDITIONS AND THE AMERICANS WITH DISABILITIES ACT REQUIREMENTS.
6. STRIPE PARKING AREAS, DRIVES AND ROADWAY AS SHOWN, INCLUDING PARKING SPACES, STOP BARS, CROSSWALKS, HANDICAP SYMBOLS, PAINTED ISLANDS AND FIRE LANES. (ALL MARKINGS EXCEPT MEDIAN ISLANDS AND CENTERLINES TO BE CONSTRUCTED USING WHITE TRAFFIC PAINT.) ALL TRAFFIC PAINT SHALL MEET THE REQUIREMENTS OF AASHTO M248 TYPE `F'. MEDIAN ISLANDS AND CENTERLINES TO BE CONSTRUCTED USING YELLOW TRAFFIC PAINT.
7. SEE DETAILS FOR PARKING STALL DIMENSIONS, HANDICAP SYMBOLS, SIGNS AND SIGN POSTS.
8. STOP BARS SHALL BE 12" WIDE.
9. PAINTED ISLANDS SHALL BE 4" WIDE DIAGONAL LINES @ 3'-0" O.C. BORDERED BY 4" WIDE LINES.

GRADING & DRAINAGE NOTES:

1. ALL STORM DRAIN PIPE SHALL BE SMOOTH BORE INTERIOR PROVIDING A MANNINGS ROUGHNESS COEFFICIENT OF n = 0.013 OR LESS.
2. PROVIDE TURF REINFORCEMENT IN AREAS INDICATED ON THE PLANS.
3. AN "AS-BUILT" CERTIFICATION OF THE STORMWATER DRAINAGE SYSTEM BY A REGISTERED ENGINEER IS REQUIRED PRIOR TO THE OWNER ACCEPTING THE BUILDING AND PROPERTY. THE CONTRACTOR IS SPECIFICALLY CAUTIONED THAT ANY DEVIATION FROM THE PLANS MAY DELAY THE ACCEPTANCE OF THE PROJECT.
4. A DETAILED O&M MANUAL FOR STORMWATER MANAGEMENT SYSTEMS IS (WILL BE) FILED WITH THE CITY OF PORTLAND DURING THE PERMIT REVIEW PROCESS. A SPECIFIC MANUAL HAS BEEN PREPARED FOR O&M OF THE DRAINAGE SYSTEM.
5. SEE EXISTING CONDITIONS FOR BENCHMARK INFORMATION.
6. SEE GRADING, DRAINAGE AND EROSION/SEDIMENT CONTROL FOR PROPOSED GRADING AND EROSION CONTROL MEASURES.
7. ALL DISTURBED AREAS NOT TO BE PAVED, SODDED OR OTHERWISE TREATED SHALL RECEIVE 4" LOAM, SEED, FERTILIZER AND MULCH.
8. COMPACTION REQUIREMENTS:

LOCATION	MINIMUM COMPACTION
SUBBASE AND BASE GRAVEL BELOW PAVED OR CONCRETE AREAS	95%
SUBGRADE FILL BELOW PAVED AREAS	90%
TRENCH BEDDING MATERIAL AND SAND BLANKET BACKFILL	95%
BELOW LOAM AND SEED AREAS	90%
STRUCTURAL FILL WITHIN PROPOSED BUILDING AREA	95%
SELECT FILL ADJACENT BUILDING FOUNDATIONS, EXTERIOR FOUNDATIONS, AND WITHIN 8 INCHES OF THE SLAB-ON-GRADE	95%

*ALL PERCENTAGES OF COMPACTION SHALL BE OF THE MAXIMUM DRY DENSITY AT THE OPTIMUM MOISTURE CONTENT AS DETERMINED AND CONTROLLED IN ACCORDANCE WITH ASTM D-1557.

9. ADJUST ALL MANHOLES, CATCH BASINS, CURB BOXES, ETC. WITHIN LIMITS OF WORK TO FINISH GRADE.
10. CONTRACTOR SHALL PROVIDE A FINISH PAVEMENT SURFACE FREE OF LOW SPOTS AND PONDING AREAS. CRITICAL AREAS INCLUDE BUILDING ENTRANCE AND EXIT RAMPS ADJACENT TO THE BUILDING AND ALONG NEW CURBED AREAS. ALL ADA COMPLIANT PARKING SPACES SHALL BE PAVED WITH A MAXIMUM SLOPE OF 2% IN ANY DIRECTION.
11. PROVIDE STABILIZATION OR SEPARATION GEOTEXTILE FABRIC OVER WETLAND AREAS TO BE FILLED OR OVER UNSTABLE SOILS AS DIRECTED BY THE OWNER'S REPRESENTATIVE AND IN ACCORDANCE WITH THE FINAL GEOTECHNICAL RECOMMENDATIONS.
12. NATIVE SOILS RANGE FROM GRANULAR TO CLAYEY AND SILTY. CARE MUST BE EXERCISED TO LIMIT DISTURBANCE OF THE BEARING SOILS. THE NATIVE CLAYEY OR SILTY SOILS SHOULD NOT BE PROOF-ROLLED. SHOULD THE SUBGRADE BECOME YIELDING OR DIFFICULT TO WORK, DISTURBED AREAS SHOULD BE EXCAVATED AND BACKFILLED WITH COMPACTED SELECT FILL OR CRUSHED STONE AT NO EXTRA EXPENSE TO THE OWNER.
13. FIVE (5.0) FEET OF CLEAN GRANULAR SOIL MEETING THE SELECT FILL GRADATION SPECIFICATIONS SHALL BE PROVIDED BELOW THE ENTRANCE SLABS AND ADJACENT SIDEWALKS. GRADUAL TRANSITION (3 HORIZONTAL TO 1 VERTICAL) OF SELECT FILL THICKNESS SHALL BE PROVIDED FROM THE 5.0 FOOT DEPTH TO THE GRAVEL BASE THICKNESS AT THE SIDEWALKS AND PAVED AREAS AWAY FROM THE BUILDINGS.

LOCAL APPROVALS, WAIVERS, AND VARIANCES:
(ADDITIONAL INFORMATION TO BE PROVIDED UPON RECEIPT OF APPROVALS)

THE CONSTRUCTION PLANS ARE TO BE SUBMITTED TO THE CITY OF PORTLAND FOR THEIR REVIEW AND APPROVAL.

UTILITY NOTES:

1. ALL REQUIRED UTILITIES SERVING THE PROJECT SHALL BE COORDINATED AND CONSTRUCTED BY THE SITE WORK CONTRACTOR TO WITHIN 5 FEET OF THE BUILDINGS, AT A LOCATION COORDINATED WITH THE MEP CONTRACTOR AND THE BUILDING PLANS. SITE WORK WITHIN 5 FEET OF UNDERSLAB UTILITIES SHALL CONSIST OF TRENCHING AND BACKFILLING. ACTUAL UTILITY INSTALLATION SHALL BE BY THE MEP CONTRACTOR. ALL REQUIRED CONNECTION FEES SHALL BE PAID BY THE GENERAL CONTRACTOR.
2. THE CONTRACTOR SHALL COORDINATE THE INSTALLATION OF AND/OR RELOCATION OF OVERHEAD AND UNDERGROUND TELEPHONE WITH CONSOLIDATED COMMUNICATIONS. CONTRACTOR SHALL BE RESPONSIBLE FOR CONDUITS, PULL WIRES, TRENCHING AND BACKFILLING NECESSARY TO COMPLETE THE WORK.
3. ALL SANITARY SEWER WORK SHALL MEET THE STANDARDS OF THE MAINE STATE PLUMBING CODE AND CITY OF PORTLAND PUBLIC WORKS DEPARTMENT.
4. THE CONTRACTOR SHALL COORDINATE THE INSTALLATION OF ELECTRIC SERVICE WITH CENTRAL MAINE POWER.
5. COORDINATE ALL UTILITY WORK WITH THE APPROPRIATE UTILITY COMPANY. ALL UTILITY WORK SHALL CONFORM TO THE STANDARDS OF THE UTILITY COMPANY AND PROJECT SPECIFICATIONS.
6. THE LOCATIONS OF THE NEW UTILITY SERVICES AND CONNECTIONS SHALL BE COORDINATED WITH THE SERVING UTILITY COMPANY.
7. UNDERGROUND ELECTRICAL, CONDUIT MATERIAL AND INSTALLATION SHALL CONFORM TO UTILITY COMPANY STANDARDS AND PROJECT SPECIFICATIONS, WHICH EVER IS MORE STRINGENT.
8. ADJUST ALL MANHOLES, CATCH BASINS, CURB BOXES, ETC. WITHIN LIMITS OF WORK TO FINISH GRADE.
9. ALL UNDERGROUND CONDUITS SHALL HAVE NYLON PULL ROPES TO FACILITATE PULLING CABLES.
10. THE CONTRACTOR SHALL OBTAIN, PAY FOR, AND COMPLY WITH ALL REQUIRED PERMITS, ARRANGE FOR ALL INSPECTIONS, AND SUBMIT COPIES OF ACCEPTANCE CERTIFICATES TO THE OWNER PRIOR TO COMPLETION OF THE PROJECT.
11. THE CONTRACTOR SHALL PROVIDE AND INSTALL ALL BOXES, FITTINGS, CONNECTORS, COVER PLATES AND OTHER MISCELLANEOUS ITEMS NOT NECESSARILY DETAILED ON THE DRAWINGS TO RENDER INSTALLATION OF UTILITIES COMPLETE AND OPERATIONAL, AT NO EXTRA EXPENSE TO THE OWNER.
12. A 10 FOOT MINIMUM EDGE TO EDGE HORIZONTAL SEPARATION SHALL BE PROVIDED BETWEEN ALL WATER AND SANITARY SEWER LINES. AN 18 INCH OUTSIDE TO OUTSIDE VERTICAL SEPARATION SHALL BE PROVIDED AT ALL WATER AND SANITARY SEWER CROSSINGS.
13. THE CONTRACTOR SHALL PHASE UTILITY CONSTRUCTION AND PROVIDE TEMPORARY SERVICES AS REQUIRED TO PROVIDE CONTINUOUS SERVICE TO THE JOBSITE. TEMPORARY SERVICES SHALL COMPLY WITH ALL FEDERAL, STATE, LOCAL AND UTILITY COMPANY STANDARDS. COORDINATE ALL TEMPORARY SERVICES WITH UTILITY COMPANY, OWNER AND AFFECTED BUSINESSES.

LANDSCAPE NOTES:

(SUBJECT TO COORDINATION WITH LANDSCAPE DRAWINGS. IN CASE OF CONFLICT, THE LANDSCAPING DRAWINGS SHALL GOVERN.)

1. ALL PLANTS SHALL BE NURSERY GROWN AND WORKMANSHIP SHALL CONFORM TO THE AMERICAN ASSOCIATION OF NURSERYMEN, STANDARDS AND SHALL BE SUBJECT TO THE APPROVAL OF THE OWNERS REPRESENTATIVE BEFORE AND AFTER PLANTING.
2. PLANTS SHALL BE GUARANTEED FOR A PERIOD OF ONE (1) YEAR AFTER INSPECTION AND ACCEPTANCE, AND SHALL HAVE AT LEAST 80% HEALTHY GROWTH AT THE END OF THE GUARANTEED PERIOD.
3. ALL DISTURBED AREAS NOT TO BE PAVED OR OTHERWISE TREATED SHALL RECEIVE 4" LOAM AND SEED.
4. THREE (3) INCH BARK MULCH IS TO BE USED AROUND THE TREE AND SHRUB PLANTING AS SPECIFIED IN THE DETAILS. WHERE BARK MULCH IS USED IN A CURBED ISLAND, THE BARK SHALL MEET THE TOP INSIDE EDGE OF THE CURB. ALL OTHER AREAS SHALL RECEIVE 4" LOAM AND SEED.
5. THE CONTRACTOR SHALL SUPPLY ALL PLANT MATERIALS IN QUANTITIES SUFFICIENT TO COMPLETE THE PLANTING AS SHOWN.
6. PARKING AREA PLANTED ISLANDS TO HAVE A MINIMUM OF 4" TOPSOIL. REMOVE ALL CONSTRUCTION DEBRIS BEFORE TOPSOILING. TOPSOIL SHALL BE PLACED TO TOP OF CURB.
7. ALL PLANT MATERIAL SHALL BE APPROVED BY THE OWNER OR THE OWNERS REPRESENTATIVE PRIOR TO ARRIVAL ON THE SITE.
8. PLANT MATERIAL SHALL BEAR THE SAME RELATIONSHIP TO FINISHED GRADE AS TO THE ORIGINAL PLANTING GRADE PRIOR TO DIGGING.
9. THE CONTRACTOR SHALL LOCATE, VERIFY, AND MARK ALL EXISTING AND NEWLY INSTALLED UNDERGROUND UTILITIES PRIOR TO ANY LAWN WORK OR PLANTING. ANY CONFLICTS WHICH MIGHT OCCUR BETWEEN PLANTINGS AND UTILITIES SHALL BE IMMEDIATELY REPORTED TO THE OWNER SO THAT ALTERNATE PLANTING LOCATIONS CAN BE DETERMINED.
10. NO SUBSTITUTION OF PLANT MATERIALS SHALL BE ALLOWED WITHOUT THE PRIOR WRITTEN APPROVAL OF THE OWNER.
11. THE CONTRACTOR SHALL BE RESPONSIBLE FOR PROTECTING ALL PLANTING AND LAWNS AGAINST DAMAGE FROM ONGOING CONSTRUCTION. THIS PROTECTION SHALL BEGIN AT THE TIME THE PLANT IS INSTALLED AND CONTINUE UNTIL THE FORMAL ACCEPTANCE OF ALL THE PLANTINGS.
12. SEE PLANTING DETAILS FOR WEED BARRIER INFORMATION.
13. ALL PLANTING LOCATED AT THE ENTRANCE TO THE PROJECT OR AT INTERSECTIONS WITHIN THE SITE WILL BE MAINTAINED AND WILL NOT EXCEED 3 FEET IN HEIGHT WITHIN A TRIANGLE FORMED 25' INTO THE DRIVEWAY AND 25' ALONG THE TRAVEL WAY.

EROSION CONTROL NOTES:

1. PRIOR TO BEGINNING ANY LAND DISTURBING ACTIVITIES. CLEARING AND GRADING LIMITS SHALL BE STAKED BY THE CONTRACTOR BASED ON THE LIMITS OF GRADING SHOWN ON THE DRAWINGS AND ACCEPTED BY THE OWNER'S REPRESENTATIVE IN THE FIELD. AFTER THE CLEARING AND GRADING LIMITS HAVE BEEN ACCEPTED, THE CONTRACTOR SHALL INSTALL THE PERIMETER SILT FENCES AND THE CONSTRUCTION ENTRANCES ASSOCIATED WITH THE PROJECT.
2. ALL GROUND AREAS GRADED FOR CONSTRUCTION SHALL BE GRADED, LOAMED, SEEDED AND MULCHED AS SOON AS POSSIBLE. TEMPORARY/PERMANENT SEED MIXTURES SHALL CONFORM TO THE SEEDING PLAN CONTAINED IN THE EROSION CONTROL PROJECT PREPARED FOR THIS PROJECT.
3. PRIOR TO PAVING, THE CONTRACTOR SHALL FLUSH SILT FROM ALL STORM LINES.
4. ALL STORM DRAIN INLETS AND OUTLETS NOT IN PAVED AREAS ARE TO RECEIVE RIPRAP PROTECTION APRONS DURING CONSTRUCTION.
5. SILT FENCES SHALL BE INSPECTED, REPAIRED AND CLEANED AS NOTED IN THE EROSION CONTROL NOTES SHOWN ON THE EROSION CONTROL DETAIL SHEET.
6. THE CONTRACTOR SHALL REPAIR AND ADD STONE TO THE CONSTRUCTION ENTRANCE AS IT BECOMES SATURATED WITH MUD TO ENSURE THAT IT FUNCTIONS TO CAPTURE MUD FROM THE TIRES OF CONSTRUCTION VEHICLES DURING CONSTRUCTION. THE PURPOSE OF THE CONSTRUCTION ENTRANCE IS TO KEEP ADJACENT STREETS CLEAR OF DIRT AND MUD, SWEEPING OF THE ROADWAYS SHALL BE PERFORMED BY THE CONTRACTOR.
7. SILT REMOVED FROM AROUND INLETS AND BEHIND THE SILT FENCES SHALL BE PLACED ON A TOPSOIL STOCKPILE AND MIXED INTO TOPSOIL FOR USE IN LANDSCAPING OPERATIONS.
8. LAND DISTURBING ACTIVITIES SHALL BE ACCOMPLISHED IN A MANNER AND SEQUENCE WHICH CAUSE THE LEAST PRACTICAL UNPROTECTED DENUDED AREAS ON THE SITE DURING CONSTRUCTION.
9. THE CONTRACTOR IS CAUTIONED THAT FAILURE TO COMPLY WITH THE SEQUENCE OF CONSTRUCTION, EROSION / SEDIMENT CONTROL PLAN, AND OTHER PERMIT REQUIREMENTS MAY RESULT IN MONETARY PENALTIES AS ENFORCED BY THE MEDEP OR LOCAL AGENCIES. THE CONTRACTOR SHALL BE ASSESSED ALL SUCH PENALTIES AT NO COST TO THE OWNER OR PERMITTEE.
10. A FULL EROSION/SEDIMENTATION CONTROL PLAN ACCOMPANIES THIS DRAWING SET AND IS ALSO CONTAINED IN THE SITE WORK SPECIFICATIONS.
11. PROVIDE INLET PROTECTION BARRIERS AROUND ALL EXISTING AND PROPOSED STORM DRAINAGE INLETS AS SHOWN AND MAINTAIN FOR THE DURATION OF THE PROJECT UNTIL PAVEMENT HAS BEEN INSTALLED.
12. INSPECT EROSION AND SEDIMENT CONTROL DEVICES AFTER EACH RAIN STORM OF 0.25 INCH OR GREATER. REPAIR/MODIFY PROTECTION AS NECESSARY TO MAXIMIZE EFFICIENCY FILTER. REPLACE ALL FILTERS WHEN SEDIMENT IS $\frac{1}{3}$ THE STRUCTURE HEIGHT.
13. INSTALL CURLEX EROSION CONTROL MAT OR EQUAL ON ALL SLOPES STEEPER THAN 3:1.
14. THE CONTRACTOR SHALL INSTALL ALL EROSION CONTROL MEASURES IN ACCORDANCE WITH THE "MAINE EROSION & SEDIMENT CONTROL HANDBOOK FOR CONSTRUCTION: BEST MANAGEMENT PRACTICES, CUMBERLAND COUNTY SOIL AND WATER CONVERSATION DISTRICT AND MAINE DEPARTMENT OF ENVIRONMENTAL PROTECTION, MARCH 1991"

CITY OF PORTLAND
SPACE AND BULK REQUIREMENTS

1. EXISTING ZONE: B5b - Urban Commercial Mixed-Use Zone; R-4 - Residential Zone
2. PARCEL SIZE: 8.40 ACRES
3. SPACE AND BULK:

	REQUIRED / ALLOWED	PROVIDED
MAXIMUM LOT COVERAGE	100%	< 100%
MAXIMUM BUILDING HEIGHT	55 FT. (62 FT. FOR ROOFTOP PROJECTIONS)	< 55 FT.
MINIMUM LOT SIZE	NONE	8.40 ACRES
MINIMUM SIDE YARD	NONE	5.3 FT.±
MINIMUM REAR YARD	NONE	120 FT.±
MINIMUM FRONTAGE	NONE	1,394 FT.
MAXIMUM FRONT YARD BUILDING SETBACK	10 FT.	< 10 FT.

4. PARKING REQUIREMENT:
   MEDICAL OFFICE - 1 SPACE/400SF
   PROPOSED OUTPATIENT CLINIC 62,300 SF — 156 SPACES — 400± SPACES (SATISFIES TENANT LEASE REQUIREMENTS)

DRAFT

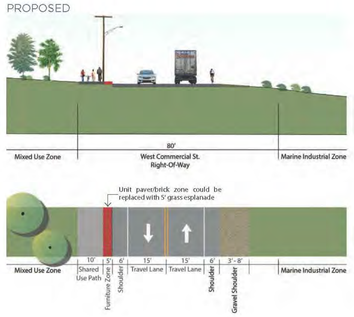
PROJECT RECOMMENDATIONS

PROJECT 2

INSTALL SHARED-USE PATH BETWEEN BENNY'S AND STAR MATCH BUILDING

A shared use path will run within the West Commercial Street ROW for an approximately 2000' stretch. The 10' wide path will be separated from the roadway by a minimum five foot buffer featuring tinted concrete or unit pavers or bricks with intermittent trees set in grates. (A cost-saving option is to use a 5' wide grassy esplanade to separate the path from the roadway.) This relatively-urban treatment will help prepare the north edge of West Commercial Street to accommodate future mixed use development. On the western half of the project area, the change in grade will require a small retaining wall along the north edge of the path (corresponds with the approximate property line). This project is currently funded by the Maine Department of Transportation (with match funding provided by the City of Portland) and is planned for implementation in the next two years.

TIMEFRAME: Short term



LEAD AGENCY(IES): MDOT + City of Portland (with funding provided by both)

COST ESTIMATE: $615,000 (grass strip)
$805,000 (5' brick strip)

EXISTING CONDITIONS

PROPOSED

WEST COMMERCIAL STREET EXISTING & PROPOSED SECTIONS FROM CASSIDY POINT SIGNAL TO STAR MATCH BUILDING
NOT TO SCALE

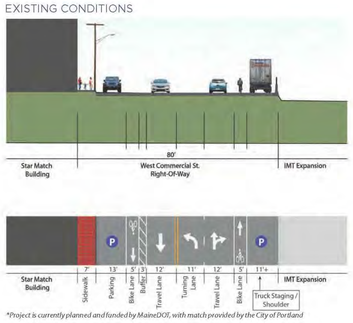
DRAFT

PROJECT RECOMMENDATIONS

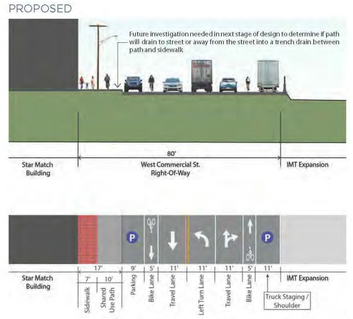
PROJECT 3

EXPAND SIDEWALK TO INCLUDE SHARED-USE PATH IN FRONT OF STAR MATCH BUILDING*

Current conditions in front of the Star Match building include a 7' brick sidewalk, 13' wide parking lane, 5' bike lane with 3' buffer and a 12' wide travel lanes. To maintain pedestrian access into and out of the multiple business entries, the current sidewalk should be maintained and the shared use path extended out into the street. This necessitates restriping the roadway with 11' wide travel lanes, a 9' parking lane and a bike lane without a buffer. That provides the necessary space for a shared use path of 10' in width. In the final design for this configuration, the cross slope of the path will need to be carefully considered to ensure appropriate drainage and placement of the utility poles. This project is currently funded by the Maine Department of Transportation (with match funding provided by the City of Portland) and is planned for implementation in the next two years.



TIMEFRAME: Short term



LEAD AGENCY(IES): MDOT + City of Portland (with funding provided by both)

COST ESTIMATE: $310,000

EXISTING CONDITIONS

PROPOSED

*Project is currently planned and funded by MaineDOT, with match provided by the City of Portland

WEST COMMERCIAL STREET EXISTING & PROPOSED SECTIONS FROM STAR MATCH BUILDING TO BEACH STREET
NOT TO SCALE

U:\3572_VA Clinic West Commercial St-Portland, ME\Z - CAD\DWG\3572-grading.dwg 1/21/2020 9:38 AM

NOTES:

1. **Pollution Prevention -** Minimize disturbed areas and protect natural downgradient buffer areas to the extent practicable. Control stormwater volume and velocity within the site to minimize soil erosion. Minimize the disturbance of steep slopes. Control stormwater discharges, including both peak flow rates and volume, to minimize erosion at outlets.
2. **Sediment Barriers -** Prior to construction, properly install sediment barriers at the downgradient edge of any area to be disturbed and adjacent to any drainage channels within the disturbed area. Sediment barriers should be installed downgradient of soil or sediment stockpiles and stormwater prevented from running onto the stockpile. Maintain the sediment barriers by removing accumulated sediment, or removing and replacing the barrier, until the disturbed area is permanently stabilized.
3. **Stabilized Construction Entrance -** Prior to construction, properly install a stabilized construction entrance (SCE) at all points of egress from the site.
4. **Temporary Stabilization -** Within 7 days of the cessation of construction activities in an area that will not be worked for more than 7 days, stabilize any exposed soil with mulch, or other non-erodible cover.
5. **Removal of Temporary Measures -** Remove any temporary control measures, such as silt fence, within 30 days after permanent stabilization is attained. Remove any accumulated sediments and stabilize.
6. **Permanent Stabilization -** If the area will not be worked for more than one year or has been brought to final grade, then permanently stabilize the area within 7 days by planting vegetation, seeding, sod, or through the use of permanent mulch, riprap, or road subbase.
7. **Winter Construction -** "Winter Construction" is construction activity performed during the period from November 1 through April 15. If disturbed areas are not stabilized with permanent measures by November 1 or new soil disturbance occurs after November 1, but before April 15, then these areas must be protected and runoff from them must be controlled by additional measures and restrictions.
8. **Inspection and Maintenance During Construction -** The following standards must be met during construction:
   (a) Inspection and Corrective Action: Inspect disturbed and impervious areas, erosion control measures, materials storage areas that are exposed to precipitation, and locations where vehicles enter or exit the site. Inspect these areas at least once a week as well as before and within 24 hours after a storm event (rainfall), and prior to completing permanent stabilization measures. A person with knowledge of erosion and stormwater control, including the standards and conditions in the permit, shall conduct the inspections.

   (b) Maintenance: If best management practices (BMPs) need to be repaired, the repair work should be initiated upon discovery of the problem but no later than the end of the next workday. If additional BMPs or significant repair of BMPs are necessary, implementation must be completed within 7 calendar days and prior to any storm event (rainfall). All measures must be maintained in effective operating condition until areas are permanently stabilized.

   (c) Documentation: Keep a log (report) summarizing the inspections and any corrective action taken. The log must include the name(s) and qualifications of the person making the inspections, the date(s) of the inspections, and major observations about the operation and maintenance of erosion and sedimentation controls, materials storage areas, and vehicles access points to the parcel. Major observations must include BMPs that need maintenance, BMPs that failed to operate as designed or proved inadequate for a particular location, and location(s) where additional BMPs are needed. For each BMP requiring maintenance, BMP needing replacement, and location needing additional BMPs, note in the log the corrective action taken and when it was taken.

   The log must be made accessible to City staff and a copy must be provided upon request. The contractor shall provide a copy to the owner who shall retain a copy of the log for a period of at least three years from the completion of permanent stabilization.
9. **Construction dewatering -** The contractor shall not discharge sediment-laden water from trench / excavation dewatering activities to City sewer / drainage systems. Dewatering effluent shall be discharged to onsite measures including, but not limited to, Dirtbag™ sediment bags, rocklined sediment sumps, roll-off canister sand filters, or Frac tanks, at no extra expense to the owner. All dewatering measures shall be reviewed and approved by the City DPW / DRC prior to implementation.

SECTION VIEW

NOTE:
CONTRACTOR SHALL SUBMIT A DEWATERING PLAN TO THE OWNER SHOWING THE PROPOSED LOCATION OF DIRTBAGS™.

SPECIFICATIONS AND REQUIREMENTS FOR DEWATERING

THIS PROJECT WILL REQUIRE THE DISCHARGE OF CONSTRUCTION DEWATERING AND TURBID LADEN RUNOFF FROM THE SITE TO BE DIRECTED AND DISCHARGED THROUGH A DIRTBAG™. THIS DESCRIPTION ALSO CONTAINS APPENDED MATERIALS DESCRIBING THE **DIRTBAGS** REFERRED TO IN THIS NARRATIVE.

OVERVIEW:

DISCHARGE OF SEDIMENT-LADEN WATER FROM THE CONSTRUCTION SITE SHALL NOT BE ACCEPTABLE. TRADITIONALLY, MEDEP PERMITS HAVE HAD A STANDARD CONDITION WHICH STATES:

"THE APPLICANT SHALL TAKE ALL NECESSARY ACTIONS TO ENSURE THAT ITS ACTIVITIES OR THOSE OF ITS AGENTS DO NOT RESULT IN NOTICEABLE EROSION OF SOILS OR FUGITIVE DUST EMISSIONS ON THE SITE DURING THE CONSTRUCTION AND OPERATION OF THE PROJECT COVERED BY THIS APPROVAL."

SUITABLE METHODS OF FILTERING WATER FROM DEWATERING OPERATIONS, OR CONSTRUCTION SITE RUNOFF, SHALL BE EMPLOYED PRIOR TO DISCHARGE TO THE STORM DRAIN SYSTEM. ACCEPTABLE METHODS OF FILTERING INCLUDE DIRTBAGS™, SAND BERM FILTERS, SEDIMENTATION PONDS OR OTHER APPROVED METHODS AS DETAILED IN THE CURRENT EDITION OF THE MDEP "MAINE EROSION AND SEDIMENT CONTROL PRACTICES FIELD GUIDE FOR CONTRACTORS".

REQUIREMENTS FOR DIRTBAGS:

THE SITE CONTRACTOR SHALL INCLUDE THE PRICE OF DEWATERING AND FILTERING OF THE CONSTRUCTION DEWATERING PRIOR TO DISCHARGE. REMOVAL OF **DIRTBAGS™** AND DISPOSAL OF SEDIMENT SHALL BE INCLUDED IN THE PRICE.

AT ALL TIMES THERE MUST BE AN UNUSED DIRTBAG AVAILABLE FOR EMERGENCY USE.

AT ALL TIMES (AFTER INITIAL SITE PREPARATION), THE CONTRACTOR SHALL HAVE ONE **DIRTBAG** ACTIVE OR READY FOR USE. THE **DIRTBAG** SHALL BE INSTALLED ON A PREPARED SUBGRADE. THIS SUBGRADE SHALL CONSIST OF THE INSTALLATION OF A LAYER OF MIRAFI 600X, AND 18 INCHES OF ¾ INCH CRUSHED STONE. THE PLAN DIMENSION OF THE CRUSHED STONE PAD SHALL EXCEED THE PLAN AREA OF THE **DIRTBAG** BY AT LEAST TWO FEET IN ALL DIRECTIONS. THE **DIRTBAG** SHALL NOT BE INSTALLED ON AN UNDERLYING SLOPE OF GREATER THAN 15 PERCENT.

CONSTRUCTION DEWATERING OPERATIONS:

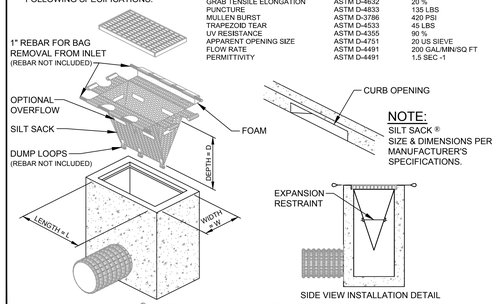
ALL CONSTRUCTION-DEWATERING OPERATIONS ARE THE RESPONSIBILITY OF THE SITE CONTRACTOR. IT SHALL BE THE SITE CONTRACTOR WHO IS RESPONSIBLE FOR SELECTING THE SITE FOR THE **DIRTBAG.**

WINTER OPERATIONS:

IN THE EVENT THAT WINTER OPERATIONS ARE REQUIRED, THE CONTRACTOR SHALL "POLY", ENCLOSE, AND PROVIDE TEMPORARY HEAT TO PREVENT THE **DIRTBAG** FROM SUBSTANTIAL FREEZING.

RECORD KEEPING

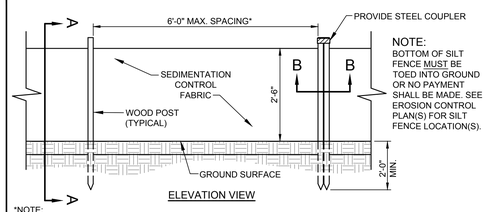
THE WEEKLY EROSION-SEDIMENT CONTROL REPORTS PREPARED IN ACCORDANCE WITH THE NPDES PERMIT SHALL MAINTAIN A LOG OF THE LOCATION, USE, AND REMOVAL OF **DIRTBAGS.** IN THE EVENT THAT THE STONE UNDER THE **DIRTBAG** BECOMES HIGHLY CONTAMINATED WITH FINES, THE NEXT **DIRTBAG** SHALL BE INSTALLED IN A DIFFERENT LOCATION.



D DIRTBAG® DETAIL AND SPECIFICATIONS
N.T.S.

NOTE: THE SILT SACK ® WILL BE MANUFACTURED FROM A WOVEN POLYPROPYLENE FABRIC THAT MEETS OR EXCEEDS THE FOLLOWING SPECIFICATIONS:

HIGH-FLOW SILT SACK ® (FOR USE IN LOW POINTS/SAGS)



(FOR AREAS OF MODERATE TO HEAVY PRECIPITATION AND RUN-OFF)

PROPERTIES	TEST METHOD	UNITS
GRAB TENSILE STRENGTH	ASTM D-4632	265 LBS
GRAB TENSILE ELONGATION	ASTM D-4632	20 %
PUNCTURE	ASTM D-4833	135 LBS
MULLEN BURST	ASTM D-3786	420 PSI
TRAPEZOID TEAR	ASTM D-4533	45 LBS
UV RESISTANCE	ASTM D-4355	90 %

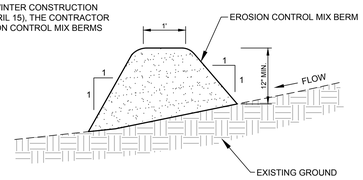
*NOTE:
THE SILT FENCE SHOULD HAVE A MAXIMUM STAKING DISTANCE OF 6', UNLESS THE FENCE IS SUPPORTED BY WIRE FENCE REINFORCEMENT, A MAXIMUM 14 GAUGE AND WITH A MINIMUM MESH SPACING OF 6".



SECTION B-B

SECTION A-A

C SILTATION FENCE DETAIL
N.T.S.

NOTE:
DURING PERIODS OF WINTER CONSTRUCTION (NOV. 15 THROUGH APRIL 15), THE CONTRACTOR SHALL INSTALL EROSION CONTROL MIX BERMS IN LIEU OF SILT FENCE.

EROSION CONTROL MIX:
EROSION CONTROL MIX SHALL CONTAIN A WELL-GRADED MIXTURE OF PARTICLE SIZES & MAY CONTAIN ROCKS LESS THAN 4" IN DIAMETER. EROSION CONTROL MIX MUST BE FREE OF REFUSE, PHYSICAL CONTAMINANTS, AND MATERIAL TOXIC TO PLANT GROWTH. THE MIX COMPOSITION SHALL MEET THE FOLLOWING STANDARDS:

- THE ORGANIC MATTER CONTENT SHALL BE BETWEEN 80 AND 100%, DRY WEIGHT BASIS.
- PARTICLE SIZE BY WEIGHT SHALL BE 100% PASSING A 6" SCREEN AND A MINIMUM OF 70%, MAXIMUM OF 85%, PASSING A 0.75" SCREEN.
- THE ORGANIC PORTION NEEDS TO BE FIBROUS AND ELONGATED.
- LARGE PORTIONS OF SILTS, CLAYS OR FINE SANDS ARE NOT ACCEPTABLE IN THE MIX.
- SOLUBLE SALTS CONTENT SHALL BE < 4.0 mmhos/cm.
- PH SHALL FALL BETWEEN 5.0 AND 8.0.

1.3.5 Erosion Control Measures and Site Stabilization

The primary emphasis of the erosion/sedimentation control plan, which will be implemented for this project, is as follows:

- Development of a careful construction sequence.
- Rapid revegetation of denuded areas to minimize the period of soil exposure.
- Rapid stabilization of drainage paths to avoid rill and gully erosion.
- The use of on-site measures to capture sediment (hay bales/ stone check dams/silt fence, etc.)

The following temporary and permanent erosion and sediment control devices will be implemented as part of the site development. These devices shall be installed as indicated on the plans or as described within this report. For further reference, see the latest edition of the Maine Erosion and Sediment Control Practices Field Guide for Contractors.

A. Dewatering

Water from construction trench dewatering shall pass first through a filter bag or secondary containment structure (e.g. hay bale lined pool) prior to discharge. The discharge site shall be selected to avoid flooding, icing, and sediment discharges to a protected resource. In no case shall the filter bag or containment structure be located within 50 feet of a protected natural resource. Dewatering discharge shall not be directed across adjacent properties in a concentrated manner.

B. Inspection and Monitoring

Maintenance measures shall be applied as needed during the entire construction season. After each rainfall, snow storm or period of thawing and runoff, the site contractor shall perform a visual inspection of all installed erosion control measures and perform repairs as needed to insure their continuous function. Following the temporary and/or final seeding and mulching, the contractor shall in the spring inspect and repair any damages and/or unestablished spots. Established vegetative cover means a minimum of 90% of areas vegetated with vigorous growth.

The following standards must be met during construction.

(a) **Inspection and corrective action**. Inspect disturbed and impervious areas, erosion control measures, materials storage areas that are exposed to precipitation, and locations where vehicles enter or exit the site. Inspect these areas at least once a week as well as before and within 24 hours after a storm event (rainfall), and prior to completing permanent stabilization measures. A person with knowledge of erosion and stormwater control, including the standards and conditions in the permit, shall conduct the inspections.

(b) **Maintenance**. If best management practices (BMPs) need to be repaired, the repair work should be initiated upon discovery of the problem but no later than the end of the next workday. If additional BMPs or significant repair of BMPs are necessary, implementation must be completed within 7 calendar days and prior to any storm event (rainfall). All measures must be maintained in effective operating condition until areas are permanently stabilized.

(c) **Documentation**. Keep a log (report) summarizing the inspections and any corrective action taken. The log must include the name(s) and qualifications of the person making the inspections, the date(s) of the inspections, and major observations about the operation and maintenance of erosion and sedimentation controls, materials storage areas, and vehicles access points to the parcel. Major observations must include BMPs that need maintenance, BMPs that failed to operate as designed or proved inadequate for a particular location, and location(s) where additional BMPs are needed. For each BMP requiring maintenance, BMP needing replacement, and location needing additional BMPs, note in the log the corrective action taken and when it was taken.

The log must be made accessible to City staff and a copy must be provided upon request. The permittee shall retain a copy of the log for a period of at least three years from the completion of permanent stabilization.

C. Temporary Erosion Control Measures

Temporary erosion control measures shall be installed by the Contractor as required by this report and as shown on the plan set for the project. Additional erosion control measures shall be installed if deemed necessary by on-site inspections of the Owner, the City of Portland, MDEP, or their representatives at no additional cost to the Owner.

The following measures are planned as temporary erosion/sedimentation control measures during construction:

1. Crushed stone-stabilized construction entrance shall be placed at any truck entrance to the project site from West Commercial Street.

2. Siltation fence or wood waste compost berms shall be installed downstream of any disturbed areas to trap runoff- borne sediments until grass areas are revegetated. The silt fence and/or wood waste compost berms shall be installed per the details provided in this package and inspected at least once a week and before and immediately after a storm event of 0.5 inches or greater, and at least daily during prolonged rainfall. Repairs shall be made if there are any signs of erosion or sedimentation below the fence or berm line. If there are signs of undercutting at the center or the edges, or impounding of large volumes of water behind the fence or berm, the barrier shall be replaced with a stone check dam. Wood waste compost berms are not to be used adjacent to wetland areas that are not to be disturbed.

3. Straw or hay mulch including hydroseeding is intended to provide cover for denuded or seeded areas until revegetation is established. Mulch placed between April 15th and October 15th on slopes of less then 15 percent shall be anchored by applying water; mulch placed on slopes of equal to or steeper than 15 percent shall be covered by a fabric netting and anchored with staples in accordance with manufacturer's recommendation. Mulch placed between October 15th and April 15th on slopes equal to or steeper than 8 percent shall be covered with a fabric netting and anchored with staples in accordance with the manufacturer's recommendations. Slopes steeper than 3:1 and equal to or flatter than 2:1, which are to be revegetated, shall receive curlex blankets by American Excelsior or equal. Slopes steeper than 2:1 shall receive riprap as noted on the plans. The mulch application rate for both temporary and permanent seeding is 75 lbs per 1000 sf as identified in the seeding plan. Mulch shall not be placed over snow.

4. Temporary stockpiles of stumps, grubbings, or common excavation will be protected as follows:

a) Temporary stockpiles shall not be located within 100 feet of any wetlands which will not be disturbed and shall be located away from drainage swales.

b) Stockpiles shall be stabilized within 7 days by either temporarily seeding the stockpile by a hydroseed method containing an emulsified mulch tackifier or by covering the stockpile with mulch, such as hay, straw, or erosion control mix.

c) Stockpiles shall be surrounded by sedimentation barrier at the time of formation.

5. For work, which is conducted between October 15th and April 15th of any calendar year, all denuded areas, shall be covered with hay mulch or erosion control mix, applied at twice the normal application rate and anchored with a fabric netting. The time period for applying mulch shall be limited to 2 days for all areas.

6. The paved access drives shall be swept to control mud and dust as necessary. Additional stone shall be added to the stabilized construction entrance to minimize the tracking of material off the site and onto the surrounding roadways.

7. During grubbing operations stone check dams shall be installed at any evident concentrated flow discharge points and as directed on the Erosion Control Plans.

8. Silt fencing with a maximum stake spacing of 6 feet shall be used, unless the fence is supported by wire fence reinforcement of minimum 14 gauge and with a maximum mesh spacing of 6 inches, in which case stakes may be spaced a maximum of 10 feet apart. The bottom of the fence shall be anchored. A double row of silt fence shall be used adjacent to wetlands.

9. Wood waste compost/bark berms may be used in lieu of siltation fencing. Berms shall be removed and spread in a layer not to exceed 3" thick once upstream areas are completed and a 90% catch of vegetation is attained.

10. Storm drain catch basin inlet protection shall be provided through the use of stone sediment barriers or approved sediment bags (such as Silt Sack). Installation details are provided in the plan set. The barriers shall be inspected after each rainfall and repairs made as necessary. Sediment shall be removed and the barrier restored to its original dimensions when the sediment has accumulated to ½ the design depth of the barrier. The barrier shall be removed when the tributary drainage area has been stabilized.

11. Water and/or calcium chloride shall be furnished and applied in accordance with MDOT specifications - Section 637 - Dust Control.

12. Loam and seed is intended to serve, as the primary permanent revegetative measure for all denuded areas not provided with other erosion control measures, such as riprap. Application rates are provided in the seeding plan. Seeding shall not occur over snow.

D. Permanent Erosion Control Measures

The following permanent erosion control measures have been designed as part of the Erosion/Sedimentation Control Plan:

1. All areas disturbed during construction, but not subject to other restoration (paving, riprap, etc.) will be loamed, limed, fertilized, mulched, and seeded. Fabric netting, anchored with staples, shall be placed over the mulch in areas as noted in Temporary Erosion Control Measures paragraph 3 of this report. Native topsoil shall be stockpiled and reused for final restoration when it is of sufficient quality.

2. Catch basins shall be provided with sediment sumps and inlet hoods (the Snout) for all outlet pipes that are 18" in diameter or less.

1.4 Implementation Schedule

The following construction sequence shall be required to ensure the effectiveness of the erosion and sedimentation control measures are optimized:

It is anticipated that construction of the VA Clinic, Parking Garage and related infrastructure will commence in Spring of 2020 and be completed by Winter of 2021.

Note: For all grading activities, the contractor shall exercise extreme caution not to overexpose the site, this shall be accomplished by limiting the disturbed area.

1. Install stabilized construction entrance at any truck entrance to the project site from West Commercial Street.
2. Install perimeter silt fence and/or wood waste berms prior to grubbing respective areas.
3. Remove and reset existing utilities in Right-of-Way.
4. Clear and grub site. Install stone check dams at any evident concentrated flow discharge points.
5. Commence cut slope installation of Retaining Wall. Install diversion berms at top of slopes.
6. Foundation area shall be excavated for installation of the building footings. Building work will be on going through the remainder of the project.
7. Commence installation of drainage appurtenances.
8. Commence earthwork and grading to subgrade.
9. Commence installation of water and sewer lines.
10. Continue earthwork and grading to subgrade as necessary for construction.
11. Complete installation of underground utilities to within 5' of the buildings.
12. Install light pole foundations and light poles.
13. Complete remaining earthwork operations.
14. Complete installation of catch basins and appurtenances.
15. Install sub-base and base gravel within parking fields, walkways, and all driveways.
16. Install curbing in parking fields, driveways, and along the streets as needed.
17. Install base course paving for access drive and parking area as well as concrete surfaces.
18. Loam, lime, fertilize, seed and mulch disturbed areas and complete all landscaping.
19. Install surface course paving for access drive and parking areas. Stripe per plan.
20. Once the site is stabilized and a 90% catch of vegetation has been obtained, remove all temporary erosion control measures.
21. Touch up loam and seed.

Note: All denuded areas not subject to final paving, riprap, or gravel shall be revegetated.

Prior to construction of the project, the contractor shall submit to the owner a schedule for the completion of the work, which will satisfy the following criteria:

1. The above construction sequence should generally be completed in the specified order; however, several separate items may be constructed simultaneously. Work must also be scheduled or phased to reduce the extent of the exposed areas as specified below. The intent of this sequence is to provide for erosion control and to have structural measures such as silt fence and construction entrances in place before large areas of land are denuded.

2. The work shall be conducted in sections which shall:

a) Limit the amount of exposed area to those areas in which work is expected to be undertaken during the proceeding 30 days.

b) Revegetate disturbed areas as rapidly as possible. All areas shall be permanently stabilized within 7 days of final grading or before a storm event.

c) Incorporate planned inlets and drainage system as early as possible into the construction phase. The ditches at the toe of cut slope shall be immediately lined or revegetated as soon as their installation is complete.

1.5 Erosion, Sedimentation and Stabilization Control Plan

The Erosion Control Plan is included in the plan set.

1.6 Details and Specifications

The Erosion Control details and specifications are included in the plan set.

1.7 Winter Stabilization Plan

The winter construction period is from November 1 through April 15. If the construction site is not stabilized with pavement, a road gravel base, 75% mature vegetation cover or riprap by November 15 then the site needs to be protected with over-winter stabilization. An area considered open is any area not stabilized with pavement; vegetation, mulching, erosion control mats, riprap or gravel base on a road, drive aisle, or parking lot.

Winter excavation and earthwork shall be completed such that any area left exposed can be controlled by the contractor. Limit the exposed area to those areas in which work is expected to be under taken during the proceeding 15 days and that can be mulched in one day prior to any snow event.

All areas shall be considered to be denuded until the subbase gravel is installed in roadway/parking areas or the areas of future loam and seed have been loamed, seeded and mulched. Hay and straw mulch rate shall be a minimum of 150 lbs./1,000 s.f. (3 tons/acre) and shall be properly anchored.

The contractor shall install any added measures which may be necessary to control erosion/sedimentation from the site dependent upon the actual site and weather conditions. Continuation of earthwork operations on additional areas shall not begin until the exposed soil surface on the area being worked has been stabilized, in order to minimize areas without erosion control protection.

1. Soil Stockpiles

Stockpiles of soil or subsoil shall be mulched for over winter protection with hay or straw at twice the normal rate or at 150 lbs/1,000 s.f. (3 tons per acre) or with a four-inch layer of woodwaste erosion control mix. This shall be done within 24 hours of stocking and re-established prior to any rainfall or snowfall.

2. Natural Resource Protection

Any areas within 100 feet from any natural resources, if not stabilized with a minimum of 75% mature vegetation catch, shall be mulched by December 1 and anchored with plastic netting or protected with erosion control mats. During winter construction, a double line of sediment barriers (i.e. silt fence backed with hay bales or erosion control mix) shall be placed between any natural resource and the disturbed area. Projects crossing the natural resource shall be protected a minimum distance of 100 feet on either side from the resource. Existing projects not stabilized by December 1 shall be protected with the second line of sediment barrier to ensure functionality during the spring thaw and rains.

3. Sediment Barriers

During frozen conditions, sediment barriers shall consist of woodwaste filter berms as frozen soil prevents the proper installation of hay bales and sediment silt fences.

4. Mulching

An area shall be considered denuded until areas of future loam and seed have been loamed, seeded and mulched. Hay and straw mulch shall be applied at a rate of 150 lb. per 1,000 square feet or 3 tons/acre (twice the normal accepted rate of 75-lbs./1,000 s.f. or 1.5 tons/acre) and shall be properly anchored. Mulch shall not be spread on top of snow. The snow shall be removed down to a one-inch depth or less prior to application. After each day of final grading, the area shall be properly stabilized with anchored hay or straw or erosion control matting. An area shall be considered to have been stabilized when exposed surfaces have been either mulched with straw or hay at a rate of 150 lb. per 1,000 square feet (3 tons/acre) and adequately anchored that ground surface is not visible though the mulch.

Between the dates of November 1 and April 15, all mulch shall be anchored by peg line, mulch netting, asphalt emulsion chemical, or wood cellulose fiber. When ground surface is not visible through the mulch then cover is sufficient. After November 1st, mulch and anchoring of all bare soil shall occur at the end of each final grading workday.

5. Mulching on Slopes and Ditches

Slopes shall not be left exposed for any extended time of work suspension unless fully mulched and anchored with peg and netting or with erosion control blankets. Mulching shall be applied at a rate of 230 lbs/1,000 s.f. on all slopes greater than 8%.

Mulch netting shall be used to anchor mulch in all drainage ways with a slope greater than 3% for slopes exposed to direct winds and for all other slopes greater that 8%. Erosion control blankets shall be used in lieu of mulch in all drainage ways with slopes greater than 8%. Erosion control mix can be used to substitute erosion control blankets on all slopes except ditches.

6. Seeding

Between the dates of October 15 and April 1st, loam or seed will not be required. During periods of above freezing temperatures finished areas shall be fine graded and either protected with mulch or temporarily seeded and mulched until such time as the final treatment can be applied. If the date is after November 1st and if the exposed area has been loamed, final graded with a uniform surface, then the area may be dormant seeded at a rate of 3 times higher than specified for permanent seed and then mulched. Dormant seeding may be selected to be placed prior to the placement of mulch and fabric netting anchored with staples. If dormant seeding is used for the site, all disturbed areas shall receive 4" of loam and seed at an application rate of 5 lbs/1,000 s.f. All areas seeded during the winter shall be inspected in the spring for adequate catch. All areas insufficiently vegetated (less than 75% catch) shall be revegetated by replacing loam, seed and mulch. If dormant seeding is not used for the site, all disturbed areas shall be revegetated in the spring.

Standards for Timely Stabilization of Construction Sites During Winter

1. Standard for the timely stabilization of ditches and channels -- The applicant shall construct and stabilize all stone-lined ditches and channels on the site by November 15. The applicant shall construct and stabilize all grass-lined ditches and channels on the site by September 1. If the applicant fails to stabilize a ditch or channel to be grass-lined by September 1, then the applicant will take one of the following actions to stabilize the ditch for late fall and winter.

Install a sod lining in the ditch -- The applicant shall line the ditch with properly installed sod by October 1. Proper installation includes the applicant pinning the sod onto the soil with wire pins, rolling the sod to guarantee contact between the sod and underlying soil, watering the sod to promote root growth into the disturbed soil, and anchoring the sod with jute or plastic mesh to prevent the sod strips from sloughing during flow conditions.

Install a stone lining in the ditch --The applicant shall line the ditch with stone riprap by November 15. The applicant shall hire a registered professional engineer to determine the stone size and lining thickness needed to withstand the anticipated flow velocities and flow depths within the ditch. If necessary, the applicant shall regrade the ditch prior to placing the stone lining so to prevent the stone lining from reducing the ditch's cross-sectional area.

2. Standard for the timely stabilization of disturbed slopes -- The applicant shall construct and stabilize stone-covered slopes by November 15. The applicant shall seed and mulch all slopes to be vegetated by September 1. The department shall consider any area having a grade greater than 15% to be a slope. If the applicant fails to stabilize any slope to be vegetated by September 1, then the applicant shall take one of the following actions to stabilize the slope for late fall and winter.

Stabilize the soil with temporary vegetation and erosion control mats -- By September 1 the applicant shall seed the disturbed slope with winter rye at a seeding rate of 3 pounds per 1,000 square feet and apply erosion control mats over the mulched slope. The applicant shall monitor growth of the rye over the next 30 days. If the rye fails to grow at least three inches or cover at least 75% of the disturbed slope by November 1, then the applicant shall cover the slope with a layer of woodwaste compost as described in item iii of this standard or with stone riprap as described in item iv of this standard.

Stabilize the slope with sod -- The applicant shall stabilize the disturbed slope with properly installed sod by September 1. Proper installation includes the applicant pinning the sod onto the slope with wire pins, rolling the sod to guarantee contact between the sod and underlying soil, and watering the sod to promote root growth into the disturbed soil. The applicant shall not use late-season sod installation to stabilize slopes having a grade greater than 33% (3H:1V).

Stabilize the slope with woodwaste compost -- The applicant shall place a six-inch layer of woodwaste compost on the slope by November 15. Prior to placing the woodwaste compost, the applicant shall remove any snow accumulation on the disturbed slope. The applicant shall not use woodwaste compost to stabilize slopes having grades greater than 50% (2H:1V) or having groundwater seeps on the slope face.

Stabilize the slope with stone riprap -- The applicant shall place a layer of stone riprap on the slope by November 15. The applicant shall hire a registered professional engineer to determine the stone size needed for stability and to design a filter layer for underneath the riprap.

3. Standard for the timely stabilization of disturbed soils -- By September 15 the applicant shall seed and mulch all disturbed soils on areas having a slope less than 15%. If the applicant fails to stabilize these soils by this date, then the applicant shall take one of the following actions to stabilize the soil for late fall and winter.

Stabilize the soil with temporary vegetation -- By September 1 the applicant shall seed the disturbed soil with winter rye at a seeding rate of 3 pounds per 1000 square feet, lightly mulch the seeded soil with hay or straw at 75 pounds per 1000 square feet, and anchor the mulch with plastic netting. The applicant shall monitor growth of the rye over the next 30 days. If the rye fails to grow at least three inches or cover at least 75% of the disturbed soil before November 1, then the applicant shall mulch the area for over-winter protection as described below.

Stabilize the soil with sod -- The applicant shall stabilize the disturbed soil with properly installed sod by September 15. Proper installation includes the applicant pinning the sod onto the soil with wire pins, rolling the sod to guarantee contact between the sod and underlying soil, and watering the sod to promote root growth into the disturbed soil.

Stabilize the soil with mulch -- By November 15 the applicant shall mulch the disturbed soil by spreading hay or straw at a rate of at least 150 pounds per 1000 square feet on the area so that no soil is visible through the mulch. Prior to applying the mulch, the applicant shall remove any snow accumulation on the disturbed area. Immediately after applying the mulch, the applicant will anchor the mulch with plastic netting to prevent wind from moving the mulch off the disturbed soil.

1.8 Maintenance of facilities

The stormwater facilities will be maintained by the Applicant, JB Brown or their assigned heirs. The contract documents will require the contractor to designate a person responsible for maintenance of the sedimentation control features during construction as required by the Erosion Control Report. Long-term operation/maintenance recommended for the stormwater facilities is presented below.

The responsible party may contract with such professionals, as may be necessary in order to comply with this provision and may rely on the advice of such professionals in carrying out its duty hereunder, provided, that the following operation and maintenance procedures are hereby established as a minimum for compliance with this section. A maintenance log of the inspections shall be kept by the responsible party.

Inspection and Maintenance Frequency and Corrective Measures:
The following areas, facilities, and measures will be inspected and the identified deficiencies will be corrected. Clean-out must include the removal and legal disposal of any accumulated sediments and debris.

Catch Basins:
Inspect catch basins 2 times per year (preferably in Spring and Fall) to ensure that the catch basins are working in their intended fashion and that they are free of debris. Clean structures when sediment depths reach 12" from invert of outlet. If the basin outlet is designed with a hood to trap floatable materials (i.e. Snout), check to ensure watertight seal is working. At a minimum, remove floating debris and hydrocarbons at the time of the inspection.

Inlet/Outlet Control Structures:
Inspect structures and piping 2 times per year (preferably in Spring and Fall) to ensure that the structures are working in their intended fashion and that they are free of debris. Remove any obstructions to flow; remove accumulated sediments and debris within the structure.

Stone Bermed Level Lip Spreaders:
Inspect 2 times per year (preferably in Spring and Fall) to ensure that they are free of debris and no undesirable growth is impeding water flow through the berm. In addition, the stone bermed level lip spreaders shall be inspected to ensure that runoff is not bypassing the bermed spreader.

Vegetated Areas:
Inspect slopes and embankments early in the growing season to identify active or potential erosion problems. Replant bare areas or areas with sparse growth. Where rill erosion is evident, armor the area with an appropriate lining or divert the erosive flows to on-site areas able to withstand the concentrated flows. The facilities will be inspected after major storms and any identified deficiencies will be corrected.

Ditches, Swales and other Open Stormwater Channels:
Inspect 2 times per year (preferably in Spring and Fall) to ensure they are working in their intended fashion and that they are free of sediment and debris. Remove any obstructions to flow, including accumulated sediments and debris and vegetated growth. Repair any erosion of the ditch lining. Vegetated ditches will be mowed at least annually or otherwise maintained to control the growth of woody vegetation and maintain flow capacity. Any woody vegetation growing through riprap linings must also be removed. Repair any slumping side slopes as soon as practicable. If the ditch has a riprap lining, replace riprap on areas where any underlying filter fabric or underdrain gravel is showing through the stone or where stones have dislodged. Correct any erosion of the channel's bottom or sideslopes. The facilities shall be inspected after major storms and any identified deficiencies shall be corrected.

Roadways and Parking Surfaces: Clear accumulations of winter sand in parking lots and along roadways at least once a year, preferably in the spring. Accumulations on pavement may be removed by pavement sweeping. Accumulations of sand along road shoulders may be removed by grading excess sand to the pavement edge and removing it manually or by a front-end loader. Repair potholes and other roadway obstructions and hazards. Plowing and sanding of paved areas shall be performed as necessary to maintain vehicular traffic safety.

Recertification

As part of the Stormwater Permit, the applicant is required to meet the standards in Appendix B of the Chapter 500 Rules. Appendix B states that a project must submit a certification of the following to the department within three months of the expiration of each five-year interval from the date of issuance of the permit.

(a) Identification and repair of erosion problems. All areas of the project site have been inspected for areas of erosion, and appropriate steps have been taken to permanently stabilize these areas.
(b) Inspection and repair of stormwater control system. All aspects of the stormwater control system have been inspected for damage, wear, and malfunction, and appropriate steps have been taken to repair or replace the system, or portions of the system.
(c) Maintenance. The erosion and stormwater maintenance plan for the site is being implemented as written, or modifications to the plan have been submitted to and approved by the department, and the maintenance log is being maintained.
(d) Proprietary Systems. All proprietary systems have been maintained according to the manufacturer's recommendations. Where required by the Department, the permittee shall execute a 5-year maintenance contract with a qualified professional for the coming 5-year interval. The maintenance contract must include provisions for routine inspections, cleaning, and general maintenance.

Housekeeping

As part of the Stormwater Permit, the applicant is required to meet the standards in Appendix C of the Chapter 500 Rules. The following procedures are hereby established as a minimum for compliance with this section. For further information on the procedures listed below, refer to Chapter 500 rules - Appendix C.

Spill Prevention:
Appropriate spill prevention, containment, and response planning/implementation shall be used to prevent pollutants from being discharged from materials on site.

Groundwater Protection:
During construction, hazardous materials with the potential to contaminate groundwater shall not be stored or handled in areas of the site which drain to an infiltration area.

Fugitive Sediment and Dust:
Appropriate measures shall be taken to ensure that activities do not result in noticeable erosion of the soils and water and/or calcium chloride shall be used to ensure that activities do not result in fugitive dust emissions during or after construction.

Debris and Other Materials:
Litter, construction debris, and chemicals exposed to stormwater must be prevented from becoming a pollutant source.

Trench or Foundation De-watering:
Water collected through the process of trenching and/or de-watering must be removed from the ponded area, and must be spread through natural wooded buffers or other areas that are specifically designed to collect the maximum amount of sediment possible.

Non-stormwater Discharges:
Identify and prevent contamination by non-stormwater discharges.

.

NOTE: THIS PLAN SET IS ISSUED FOR PERMITTING PURPOSES AND SHALL NOT BE USED FOR CONSTRUCTION.

GENERAL SHEET NOTES

A. REFER TO THE A0.X SERIES SHEETS FOR ARCHITECTURAL GENERAL NOTES, DRAWING, REFERENCE AND MATERIAL SYMBOLS, ABBREVIATIONS, AS WELL AS DIMENSIONING CONVENTIONS USED ON THIS SHEET.

B. FOR BASIC LIFE SAFETY AND CODE INFORMATION APPLYING TO THIS PROJECT, REFER TO THE G2.X SERIES SHEETS LOCATED PER THE PROJECT SHEET INDEX.

C. REFER TO THE A3.X SERIES SHEETS FOR THE REFLECTED CEILING PLANS.

D. REFER TO THE A9.2.X SERIES SHEETS FOR PARTITION SYSTEMS TYPES AND DETAILS.

E. REFER TO THE A9.3.X SERIES SHEETS FOR THE INTERIOR OPENING SCHEDULE(S), TYPES, AND DETAILS.

F. REFER TO THE 'AF' SERIES SHEETS FOR INTERIOR FINISH INFORMATION.

G. REFER TO THE 'AI' SERIES SHEETS FOR INTERIOR FURNISHING INFORMATION.

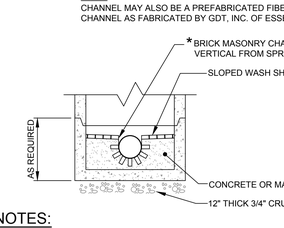
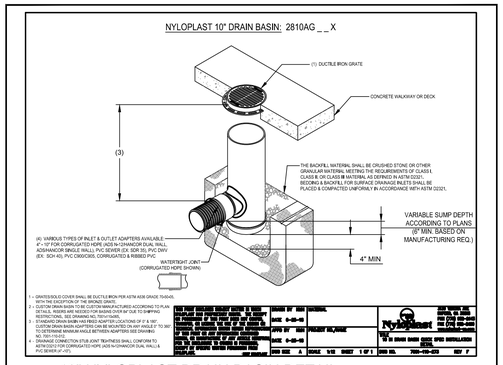
U:\3572_VA Clinic West Commercial St-Portland, ME\Z – CAD\DWG\3572–UTILITY.dwg 12/5/2019 11:07 AM



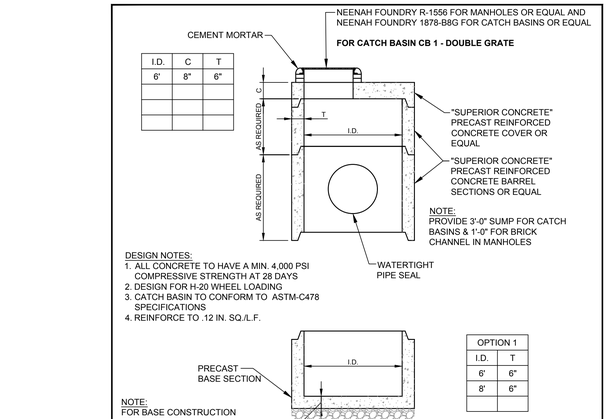
NOTE:
WHERE DEPTH OF COVER IS NOT SUFFICIENT TO USE CONCENTRIC OR TRUNCATED CONE, A FLAT TOP MAY BE USED.

(A) 4'-0" PRECAST CATCH BASIN
N.T.S.



NOTE:
LOCATIONS AS NOTED ON PLANS - COORDINATE WITH ARCHITECTURAL AND / OR STRUCTURAL PLANS.

(D) TYPICAL FOUNDATION DRAIN DETAIL
N.T.S.



NOTES:
1. BRICK CHANNEL TO BE AASHTO M-91-42 GRADE SA SEWER BRICK.*
2. MANHOLE TEST TO BE ACCOMPLISHED AFTER CHANNEL INSTALLATION IS COMPLETE.
3. WHERE THE ALIGNMENT CHANGES OR SIDE FLOW ENTERS THE MANHOLE, CONSTRUCT CHANNEL WITH A SMOOTH RADIAL CHANNEL TO ACCOMPLISH ALL JUNCTIONAL CHANGE OF ALIGNMENT WITHIN MANHOLE.

(H) MANHOLE BRICK CHANNEL INSTALLATION DETAIL
N.T.S.

(L) 10" NYLOPLAST DRAIN BASIN DETAIL
N.T.S.

DESIGN NOTES:
1. ALL CONCRETE TO HAVE A MIN. 4,000 PSI COMPRESSIVE STRENGTH AT 28 DAYS
2. DESIGN FOR H-20 WHEEL LOADING
3. CATCH BASIN TO CONFORM TO ASTM-C478 SPECIFICATIONS
4. REINFORCE TO .12 IN. SQ./L.F.

NOTE:
PROVIDE 3'-0" SUMP FOR CATCH BASINS & 1'-0" FOR BRICK CHANNEL IN MANHOLES

OPTION 1	
I.D.	T
6'	6"
8'	6"

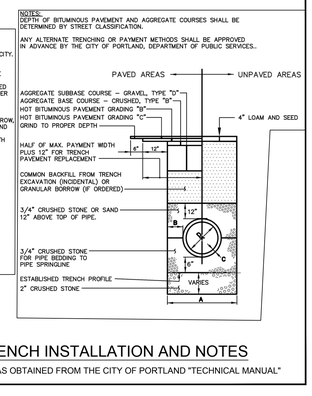
NOTE:
FOR BASE CONSTRUCTION SEE BASE DETAIL

BASE DETAIL OPTION 1

OPTION 2	
I.D.	W
6'	9'
8'	11'-4"

BASE DETAIL OPTION 2

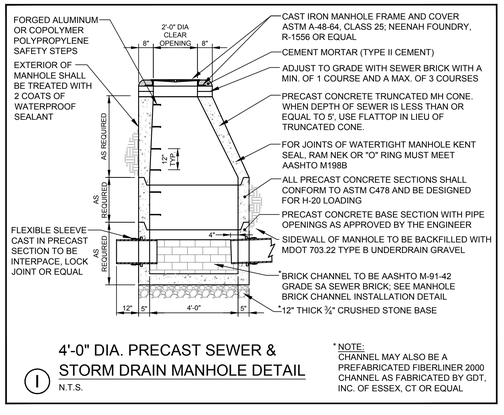
NOTE:
THE CONTRACTOR SHALL USE BASE OPTION 2 UNLESS ANTIFLOATATION COMPUTATIONS ARE PROVIDED BY THE CONTRACTOR DEMONSTRATING OPTION 1 CAN BE USED AT THIS SITE. APPROVAL IS SUBJECT TO REVIEW OF THE ENGINEER.



(B) LARGE DIAMETER STORM DRAIN MANHOLE AND CATCH BASIN WITH FLAT TOP
N.T.S.

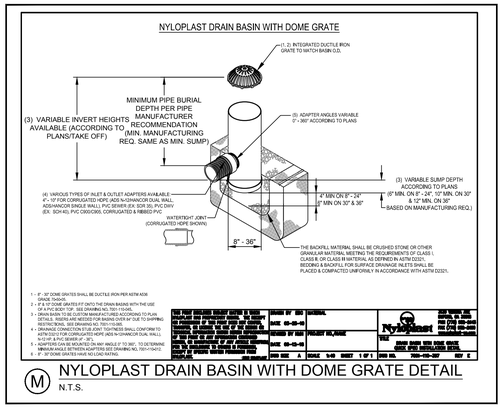
NOTES
1. ALTERNATIVE CONSTRUCTION METHODS OR PAYMENT METHODS SHALL BE APPROVED IN ADVANCE BY THE CITY.
2. IN PAVED AREAS, DEPTHS OF GRAVEL AND HOT MIX ASPHALT SHALL BE THE DEPTHS GREATER OF EXISTING CONDITIONS OR THE REQUIREMENTS FOR THE CORRESPONDING STREET CLASSIFICATION.
3. DIMENSION **B** SHALL BE SUFFICIENT TO ALLOW CRUSHED STONE BEDDING TO BE PLACED AND COMPACTED UNDER THE HAUNCHES OF THE PIPE, BUT IN ALL CASES DIMENSION **B** SHALL BE AT LEAST 8".
4. DIMENSION **A** IS THE MAXIMUM WIDTH ALLOWED FOR CALCULATING PAY QUANTITIES UNDER GRANULAR BORROW, CRUSHED STONE, STRUCTURAL EARTH EXCAVATION, AND STRUCTURAL ROCK EXCAVATION. DIMENSION **A** SHALL BE BASED ON PIPE DIAMETER **D**, AS SET FORTH IN THE FOLLOWING TABLE.

PIPE DIAMETER, D (INCHES)	MAX. TRENCH WIDTH, A (FEET)
4	4.0
6	4.0
8	4.0
10	4.0
12	5.0
15	5.0
18	5.0
21	5.0
24	6.0
27	6.0
30	6.0
36	6.0
42	7.0
48	7.0



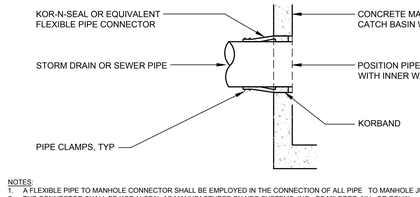
NOTE:
DEPTH OF BITUMINOUS PAVEMENT AND AGGREGATE COURSES SHALL BE DETERMINED BY STREET CLASSIFICATION.

ANY ALTERNATE TRENCHING OR PAYMENT METHODS SHALL BE APPROVED IN ADVANCE BY THE CITY OF PORTLAND, DEPARTMENT OF PUBLIC SERVICES..



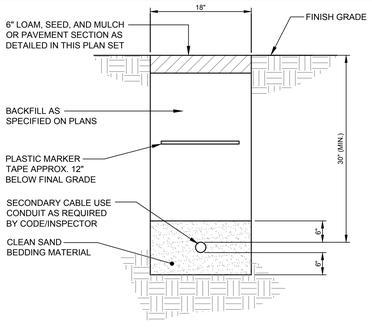
(E) TYPICAL PIPE TRENCH INSTALLATION AND NOTES
N.T.S.

AS OBTAINED FROM THE CITY OF PORTLAND "TECHNICAL MANUAL"



(I) 4'-0" DIA. PRECAST SEWER & STORM DRAIN MANHOLE DETAIL
N.T.S.

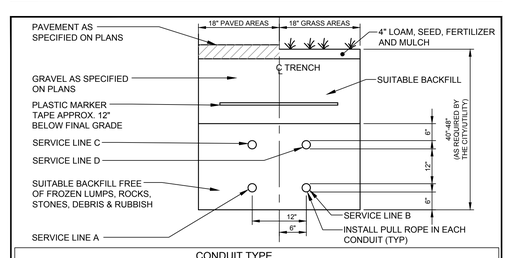
* NOTE:
CHANNEL MAY ALSO BE A PREFABRICATED FIBERLINER 2000 CHANNEL AS FABRICATED BY GDT, INC. OF ESSEX, CT OR EQUAL



(M) NYLOPLAST DRAIN BASIN WITH DOME GRATE DETAIL
N.T.S.

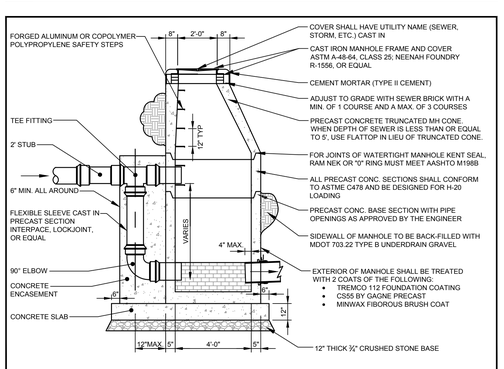
NOTES:
1. A FLEXIBLE PIPE TO MANHOLE CONNECTOR SHALL BE EMPLOYED IN THE CONNECTION OF ALL PIPE TO MANHOLE JUNCTIONS.
2. THE CONNECTOR SHALL BE KOR-N-SEAL AS MANUFACTURED BY NPC SYSTEMS, INC., OF MILFORD, NH OR EQUAL.
3. THE CONNECTOR SHALL BE THE SOLE ELEMENT RELIED ON TO ASSURE A FLEXIBLE WATERTIGHT SEAL OF THE PIPE TO MANHOLE. NO ADHESIVES OR LUBRICANTS SHALL BE EMPLOYED IN THE INSTALLATION OF THE CONNECTOR TO THE MANHOLE. THE RUBBER FOR THE CONNECTOR SHALL COMPLY TO ASTM C443 AND ASTM C923 AND CONSIST OF EPDM AND ELASTOMERS KNOWN TO BE RESISTANT TO OZONE, WEATHER ELEMENTS, CHEMICALS, INCLUDING ACIDS, ALKALIS, ANIMAL AND VEGETABLE FATS, OILS AND PETROLEUM PRODUCTS FROM SPILLS.
4. ALL STAINLESS STEEL ELEMENTS OF THE CONNECTOR SHALL BE TOTALLY NON-MAGNETIC SERIES 304 STAINLESS, EXCLUDING THE WORM SCREW USED FOR TIGHTENING THE STEEL BAND AROUND THE PIPE WHICH SHALL BE SERIES 305 STAINLESS. THE WORM SCREW USED FOR TIGHTENING THE STEEL BAND SHALL BE TORQUED BY A BREAK-AWAY TORQUE WRENCH AVAILABLE FROM THE PRECAST MANHOLE SUPPLIER, AND SET AT 60/70 in/lbs.
5. THE CONNECTOR SHALL BE INSTALLED IN THE MANHOLE WALL BY ACTIVATING THE EXPANDING MECHANISM IN STRICT ACCORDANCE WITH THE RECOMMENDATION OF THE CONNECTOR MANUFACTURER.
6. THE CONNECTOR SHALL BE OF A SIZE SPECIFICALLY DESIGNED FOR THE PIPE MATERIAL AND SIZE BEING UTILIZED ON THE PROJECT.
7. ALL CONNECTORS WHICH ARE CAPPED AWAITING PIPE INSTALLATION AT A LATER DATE MUST BE RESTRAINED.

PIPE CONNECTION TO PRECAST CONCRETE (C) SANITARY SEWER AND STORM DRAINAGE STRUCTURE
N.T.S.



(G) SECONDARY ELECTRICAL TRENCH DETAIL
N.T.S.

(K) CLEANOUT DETAIL
N.T.S.

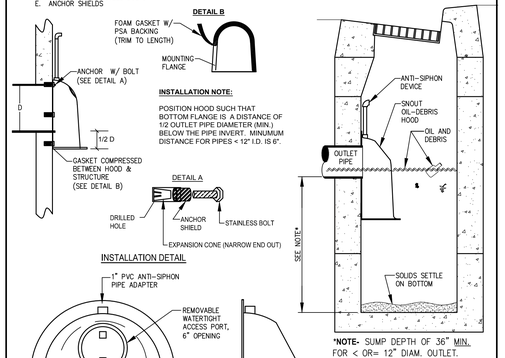


CONDUIT TYPE					
SERVICE	CONDUIT SIZE	GRASS AREAS	PAVED AREAS	UTILITY	REMARKS
A	2-6"	SCHEDULE 40 PVC ELECTRICAL GRADE	RIGID GALVANIZED STEEL, ASTM A120*	POWER	SEE NOTE
B	2-4"	SCHEDULE 40 PVC	RIGID GALVANIZED STEEL, ASTM A120*	TELEPHONE	SEE NOTE
C	2-4"	SCHEDULE 40 PVC	RIGID GALVANIZED STEEL, ASTM A120*	COMMUNICATION	SEE NOTE
D	2-4"	SCHEDULE 40 PVC	RIGID GALVANIZED STEEL, ASTM A120*	SPARES	SEE NOTE

*AS REQUIRED BY CITY /UTILITY

NOTES:
1. ONE CONDUIT CAPPED FOR SPARE, PROVIDE GALVANIZED STEEL LONG SWEEP AT RISER POLE AND EXTEND GALVANIZED CONDUIT TO 10' ABOVE GRADE AT POLE WITH STAND-OFF BRACKETS. COORDINATE WITH ELECTRICAL PLANS.
2. IN CITY RIGHT OF WAY, CONDUITS TO HAVE 36" MIN. COVER AND SHALL BE ENCASED WITH MIN. 3" CONCRETE ON ALL SIDES.

(F) UTILITY TRENCH - PRIMARY ELEC., TEL. & COMM.
N.T.S.



(J) 4'-0" DIA. DROP MANHOLE
N.T.S.

NOTES:
1. ALL HOODS AND TRAPS FOR CATCH BASINS AND WATER QUALITY STRUCTURES SHALL BE AS MANUFACTURED BY BEST MANAGEMENT PRODUCTS, INC. TOLL FREE: (800) 504- 8008 OR (888) 354- 7585 WEB SITE: www.bmpinc.com OR PRE-APPROVED EQUAL.
2. ALL HOODS SHALL BE CONSTRUCTED OF A GLASS REINFORCED RESIN COMPOSITE WITH ISO GEL COAT EXTERIOR FINISH WITH A MINIMUM 0.125" LAMINATE THICKNESS.
3. ALL HOODS SHALL BE EQUIPPED WITH A WATERTIGHT ACCESS PORT, A MOUNTING FLANGE, & AN ANTI-SIPHON VENT AS DRAWN. (SEE CONFIGURATION DETAIL)
4. THE SIZE AND POSITION OF THE HOOD SHALL BE DETERMINED BY OUTLET PIPE SIZE IN ACCORDANCE WITH THE FOLLOWING TABLE:

STRUCTURE OUTLET HOLE SIZE	SNOUT SIZE
11.9" O.D. OR LESS	12 F or R
12.0"–17.9" O.D.	18 F or R
18.0"–23.9" O.D.	24 F or R
24.0"–29.9" O.D.	30 F or R
30.0"–47.9" O.D.	48 F
48.0"–95.9" O.D.	96 F

5. THE BOTTOM OF THE HOOD SHALL EXTEND DOWNWARD A DISTANCE EQUAL TO 1/2 THE OUTLET PIPE DIAMETER WITH A MINIMUM DISTANCE OF 6" FOR PIPES <12" I.D.
6. THE ANTI-SIPHON VENT SHALL EXTEND ABOVE HOOD BY MINIMUM OF 3" AND A MAXIMUM OF 24" ACCORDING TO STRUCTURE CONFIGURATION.
7. THE SURFACE OF THE STRUCTURE WHERE THE HOOD IS MOUNTED SHALL BE FINISHED SMOOTH AND FREE OF LOOSE MATERIAL.
8. THE HOOD SHALL BE SECURELY ATTACHED TO STRUCTURE WALL WITH 3/8" STAINLESS STEEL BOLTS AND OIL-RESISTANT GASKET AS SUPPLIED BY MANUFACTURER. (SEE INSTALLATION DETAIL)
9. INSTALLATION INSTRUCTIONS SHALL BE FURNISHED WITH MANUFACTURER SUPPLIED INSTALLATION KIT, WHICH INCLUDES:
   A. INSTALLATION INSTRUCTIONS
   B. PVC ANTI-SIPHON VENT PIPE AND ADAPTER
   C. OIL-RESISTANT CRUSHED CELL FOAM GASKET WITH PSA BACKING
   D. 3/8" STAINLESS STEEL BOLTS
   E. ANCHOR SHIELDS

(N) SNOUT OIL–WATER–DEBRIS SEPARATOR DETAIL
N.T.S.

SNOUTS INSTALLED ON STORM DRAIN PIPES GREATER THAN 18" DIAMETER ARE REQUIRED TO BE INSTALLED PRIOR TO INSTALLATION OF CATCH BASIN FLAT TOP.

NOTE: THIS PLAN SET IS ISSUED FOR PERMITTING PURPOSES AND SHALL NOT BE USED FOR CONSTRUCTION.

LANDSCAPE NOTES

1. PLANTING OF TREES AND SHRUBS SHALL NOT OCCUR UNTIL ALL GRADING AND PAVING IS COMPLETED IN THE AREA.
2. ALL PLANTS SHALL HAVE A NORMAL HABIT OF GROWTH FOR THE SPECIES AND SHALL BE SOUND, HEALTHY AND FREE OF DISEASE AND INSECTS. THEY SHALL CONFORM TO THE SIZE SPECIFICATION INDICATED ON THE PLANT LIST AND SHALL CONFORM TO ANSI Z60.1 - NURSERY STOCK, LATEST REVISION.
3. ALL PLANTS SHALL HAVE ALL ROOTBALL WRAPPING MATERIALS (BURLAP, WIRE, STRING, ROPE, POTS, ETC.) REMOVED AT THE TIME OF PLANTING. REMOVE SOIL PLACED ABOVE ROOTS TO EXPOSE TRUNK FLARE AS NECESSARY TO DETERMINE SETTING LEVEL AND PIT DEPTH. CIRCLING ROOTS OR ROOTS THAT WOULD LATER GIRDLE THE PLANT SHALL BE STRAIGHTENED OR CUT OR THE ROOT BALL SHALL BE CUT UTILIZING THE "BUTTERFLY METHOD".
4. BACKFILL MIX FOR ALL PLANT MATERIAL, EXCEPT TREES, SHALL BE COMPOSED OF TWO PARTS EXISTING SOIL AMENDED WITH ONE PART COMPOST, OR WITH ONE PART SANDY FILL IF HEAVY SOILS. TREE PITS SHALL BE BACKFILLED WITH EXISTING SOIL. PLANTING PITS SHALL BE EXCAVATED TO TWICE THE DIAMETER AND TO THE SAME DEPTH OF THE PLANT ROOT BALL. BACKFILL 1/2 OF DEPTH OF PIT AT A TIME AND COMPACT. REFER TO FERTILIZER RATES AND INSTALL SLOW RELEASE FERTILIZER AFTER FIRST BACKFILL LIFT.
5. ALL PLANTINGS SHALL HAVE SLOW RELEASE FERTILIZER TABLETS INSTALLED. TABLETS SHALL BE AGRIFORM 21-GRAM 20-10-5 PLANTING TABLETS OR AN APPROVED EQUAL. APPLICATION RATE: PERENNIALS - 1 TABLET/PLANT, WOODY SHRUBS TO 3'-0" - 2 TABLETS/PLANT, SHRUBS AND TREES 3'-0" TO 6'-0"-3 TABLETS/PLANT AND TREES 6'-0" AND ABOVE - 4 TABLETS/PLANT. AFTER PLANTS ARE INSTALLED, LIQUID FEED ALL PLANTS WITH ROOTS OR AN APPROVED EQUAL. MIX ACCORDING TO MANUFACTURERS INSTRUCTIONS. APPLICATION RATE: PERENNIALS - 2 QT/PLANT, WOODY SHRUBS TO 4'-0" - 1.5 GAL/PLANT, TREES AND SHRUBS 4'-0" TO 10'-0" 3.0 GAL/PLANT AND TREES 10' AND ABOVE - 4.0 GAL/PLANT.
6. ALL TREES REQUIRE A MINIMUM OF 2 STAKES EACH AND ALL SHALL BE GUYED OR STAKED. TREE STAKING MATERIAL SHALL BE REMOVED BY THE LANDSCAPE CONTRACTOR AFTER ONE GROWING SEASON.
7. ALL PLANTINGS ARE IN MULCHED BEDS. ALL PLANTING BEDS SHALL BE FREE OF WEEDS OR GRASS PRIOR TO INSTALLATION OF MULCH. IF VEGETATION EXISTS, TREAT WITH HERBICIDE. MULCH SHALL BE MEDIUM SHREDDED BARK, 3" DEPTH. ALL PLANTINGS NOT IN BEDS OR ISLANDS SHALL HAVE MULCHED WATER RINGS ACCORDING TO THE DETAIL.
8. ALL PLANTS SHALL HAVE THEIR LOCATIONS STAKED AND APPROVED BY THE LANDSCAPE ARCHITECT OR OWNER PRIOR TO PLANT INSTALLATION. ALL PLANTS SHALL BE ORIENTED FOR BEST APPEARANCE.
9. PLANT SPECIES SUBSTITUTIONS WILL NOT BE ALLOWED UNLESS FIRST APPROVED BY THE LANDSCAPE ARCHITECT, OWNER, AND MUNICIPAL AUTHORITY (IF APPLICABLE). ANY CHANGE TO PLANT SPECIES, DUE TO LACK OF AVAILABILITY DURING CONSTRUCTION, SHALL BE APPROVED BY THE LANDSCAPE ARCHITECT.
10. ALL PLANTS SHALL BE GUARANTEED FOR ONE YEAR FROM DATE OF FINAL ACCEPTANCE BY THE OWNER. ANY PLANTS THAT DIE DURING THE GUARANTEE PERIOD SHALL BE REPLACED BY THE CONTRACTOR AT NO COST TO THE OWNER. A WRITTEN WARRANTY, WITH CONTRACTOR'S CONTACT INFORMATION, DATE OF ACCEPTANCE AND LENGTH OF GUARANTEE PERIOD SHALL BE SUBMITTED AS PART OF JOB CLOSEOUT.
11. ALL AREAS NOT IDENTIFIED WITH OTHER SURFACE TREATMENTS SHALL BE LAWN. THE LAWN AREA SHALL BE LOAMED, SEEDED AND STRAW MULCHED. THE CONTRACTOR SHALL BE RESPONSIBLE FOR LAWN MAINTENANCE. MAINTENANCE SHALL COMMENCE AT THE TIME OF PLANTING AND CONTINUE UNTIL GRASS IS FULL AND ESTABLISHED AND ACCEPTED BY THE OWNER. SEE SHEET C-7.7 FOR SEED MIX DETAILS.
12. ALLOW SHRUBS AND ORNAMENTAL GRASSES TO GROW TOGETHER TO FORM A NATURAL LOOKING PLANT MASS AND ALLOW EVERGREEN SHRUBS TO GROW TOGETHER TO FORM A SOLID GROUND COVER.
13. IF QUANTITIES OF PLANTS LISTED IN THE PLANT LIST DO NOT CORRELATE WITH THOSE INDICATED ON THE PLAN, THE QUANTITIES ON THE PLAN SHALL GOVERN.
14. REMOVE EXISTING GRASS AND WEEDS FROM ALL AREAS TO BE PLANTED PRIOR TO PLANT INSTALLATION. LOAM, SEED AND STRAW MULCH (OR OTHER SURFACE TREATMENT AS INDICATED) ALL AREAS DISTURBED BY CONSTRUCTION.

NOTE: THIS PLAN SET IS ISSUED FOR PERMITTING PURPOSES AND SHALL NOT BE USED FOR CONSTRUCTION.

Memorandum
Planning and Urban Development Department
Planning Division

To: Brandon Mazer, Chair and Members of the Portland Planning Board
From: Andrew Tufts, Planner
Date: February 21, 2020
Re: 100 Andover Street, Maine Behavioral Health
Project #: PL-000930-2019 CBL: 239A A003001
Meeting: February 24, 2020

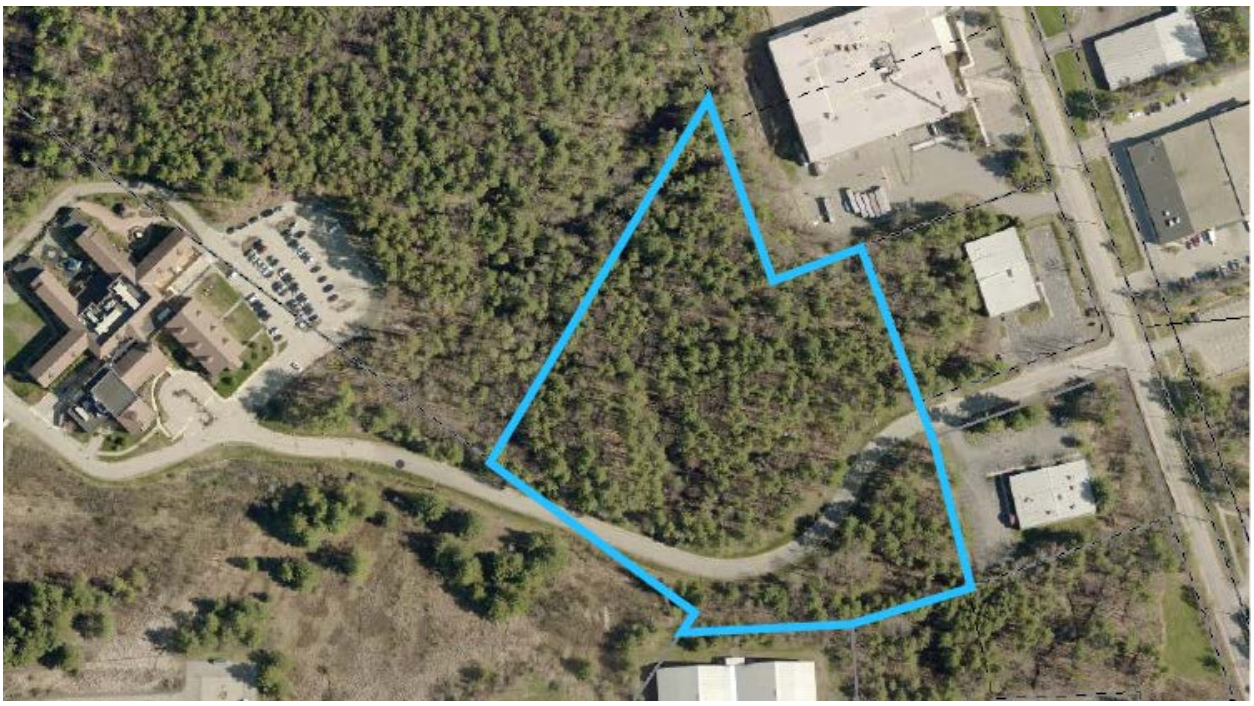

Figure 1: Parcel outline - Source: City of Portland Maine Parcel Viewer

I. INTRODUCTION

MaineHealth LLC, dba Maine Behavioral Healthcare has submitted a Level III Site Plan application for the development of a Center of Excellence in Autism and Developmental Disorders. The property is approximately 9.3 acres along 60' feet of street frontage on Andover Street. The site is located in the IM – Industrial Moderate zone. Medical clinics and professional offices are permitted uses in the IM Zone.

The Planning Department sent 41 notices advertising this meeting to property owners within 500 feet of the site. Legal advertisements ran in the February 15th & February 16th editions of the Portland Press Herald.

Applicant: Maine Behavioral Healthcare, LLC

Consultants: Barry J. Hosmer (Landscape Architect) David Titcomb (Titcomb Associates (Surveying)) Charlie Rizza (Architect) Maureen Mcglone (Ransom Consulting Engineers)

II. REQUIRED REVIEWS

Waiver Requests	*Applicable Standards*
The applicant is requesting a waiver of the required number of bicycle parking spaces as that would exceed over 50 bike spaces which is considered excessive for the clinic use.	Technical Standards – Transportation Standards –Bicycle Parking (14-526 (a) 4 b) b) Non-residential structures. Two (2) bicycle parking spaces for every ten (10) vehicle parking spaces for the first one hundred (100) required vehicle parking spaces, plus one (1) bicycle parking space for every twenty (20) required motor vehicle parking space over one hundred (100) required vehicle parking spaces.
4′ setback for a paved walking path around the playground, to better serve the users of the playground to allow for a loop walking path to lessen back and forth potential conflict among users.	Section 14-250 Dimensional Requirements (h) Pavement Setback from lot boundary; Ten (10) Feet
Review	*Applicable Standards*
Site Plan	*Section 14-526*

III. PROJECT DATA

Building Floor Area	NA	28,200 SF	+ 28,200 SF
Impervious Surface Area	NA	94,100 SF	+ 94,100 SF
Parking Spaces	0	119	+ 119
Bicycle Parking Spaces	0	3	+ 3

Figure 2: Existing conditions - Source: Andrew Tufts

IV. EXISTING CONDITIONS

The proposed development site is located on 100 Andover Street which is connected to outer Congress Street via Hutchins Drive. The parcel is approximately 9.3 acres in size. To the east of the property is Hydro International, the recently purchased MaineHealth warehouse and professional office building and Hutchins Drive. To the south is APEX Racket and Fitness Club, the American Red Cross and Cross Insurance.

The applicant is Maine Behavioral Healthcare and the owner of the parcel is MaineHealth, LLC. The site is currently undeveloped, and is part of the larger parcel of Spring Harbor Hospital, which was reviewed and approved by the City of Portland in 2002. The site is entirely forested, with a mix of pine and hardwood as the overstory, with wild blueberry and other acid loving shrubs covering much of the understory. Some invasive plants have been identified closer to Andover Street in areas of disturbance. The western portion of the property is a designated wetland. Approximately 1000' feet of wooded buffer is between the site and the Stroudwater River. The site is identified as a potential nesting/ roosting area of Long Nosed Bats, and as such any clearing must occur prior to April 19, 2020, or after September.

Owen Haskell, Inc. completed a boundary and topographic survey of the site. There were no existing or proposed easements identified.

Figure 3: Conceptual rendering – Entrance drive looking north - Source: Barry Hosmer

V. PROPOSED DEVELOPMENT

The proposed development includes a single story, 28,200 square foot building which would house outpatient services, professional offices as well as day treatment services and classrooms. The facility would be called the Center of Excellence in Autism and Developmental Disorders. Much of the care in this type of facility is on a one to one basis of provider and patient. The facility will be open from 8 AM to 5PM, with the school running from 9 AM to 2 PM. There are anticipated to be approximately 85 employees. The school would operate in its own wing of the building with its own entrance, occupying roughly 20-40% of the surface area, with the professional offices occupying the remaining space. A playground is proposed at the rear of the building, and is designed with a circuitous path so as to avoid conflict between users of the space. The parking field consists of 113 standard spaces and 6 handicap accessible spaces (85 employees, 39 visitors) comprising 51,530 square feet of impervious and permeable paving. The total area of the project is 93,700 square feet.

VI. PUBLIC COMMENT AND NEIGHBORHOOD MEETING

The applicant team held a neighborhood meeting on the evening of January 29, 2020 from 5:15 PM until approximately 6:35 PM at Spring Harbor Hospital. No one from the public attended the meeting. Attending on behalf of the development team were Barry Hosmer, project Landscape Architect, and Richard Gavin from Maine Behavioral Healthcare. **(See Attachment G)**

VII. RIGHT, TITLE, & INTEREST AND FINANCIAL & TECHNICAL CAPACITY

The owner of the property is MaineHealth, LLC. The applicant provided a copy of the warranty deed, recorded at the Cumberland County Registry of Deeds in CCRD Book 1740 page 106, which demonstrates their right, title and interest in the property. The applicant team cited their experience and qualifications to demonstrate capacity to design and construct the project. **(See Attachments C & D)**

IX. ZONING ANALYSIS

Dimensional requirements for this project are dictated by the IM – Moderate Impact Zone.

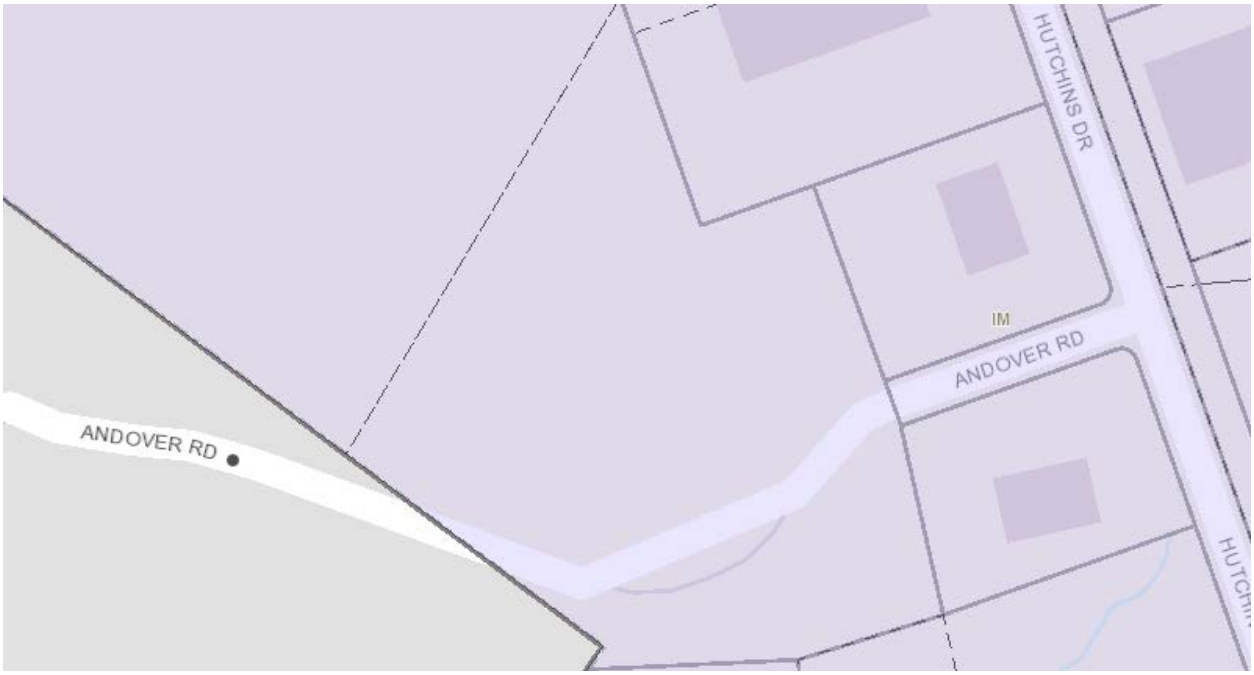

Figure 4: Zoning Map

Zoning Requirements	IM	Provided	+/-
Minimum Lot Size	None	9.3 AC	
Minimum Street Frontage	60 ft	60 ft	
Front Yard	Minimum: 27 ft	Minimum: 75 ft	
Minimum Side Yard	25 ft	39 ft	
Yard Left	25 ft	275 ft	
Minimum Rear Yard	25 ft	125 ft	
Maximum Lot Coverage	75%	23%	
Maximum Structure Height	75 ft	27 ft	
Parking	71	119	**+ 48**
Bicycle Parking	42 spaces	3 spaces	**- 39**

IX. DEVELOPMENT REVIEW

A. SITE PLAN SUBMISSION REQUIREMENTS (Section 14-527)

SITE PLAN STANDARDS (Section 14-526)

The proposed development has been reviewed by staff for conformance with the relevant review standards of Portland's site plan ordinance and applicable regulations. Staff comments are listed below.

1. *Transportation Standards*

a. Impact on Surrounding Street Systems and Access and Circulation

The site is located on Andover Street which is connected to outer Congress Street via Hutchins Drive. The site will be served primarily by passenger vehicles. A limited number of shuttle buses or vans may bring some students, and a trash vehicle will need to access the dumpster to the rear of the building. Deliveries would access the building through the front door. The parking lot system was designed to have a separate drop off lane for students and patients with limited parking just south of the building, for safety purposes. The main travel way for staff, patients and parents is located south of the landscaped island. The project has provided 6 universal handicap spaces.

Per ADA, an accessible route to a building entrance must be provided from the sidewalk serving the site. The applicant is working with City staff to meet this requirement.

Trip generation analysis shows that the new Maine Behavioral Health Center of Excellence in Autism and Development Disorders will generate in excess of 100 new peak hour trips. As a result, the project requires a Traffic Movement Permit (TMP) from the Maine Department of Transportation (MaineDOT). The City of Portland has Delegated Review Authority to review the application materials and issue the TMP on behalf of MaineDOT. A traffic study was submitted on January 28, 2020 and a Scoping Meeting was held on February 6, 2020. An initial traffic impact study has been submitted and is in review.

b. Sidewalks

Andover Street is a private drive and sidewalks do not exist.

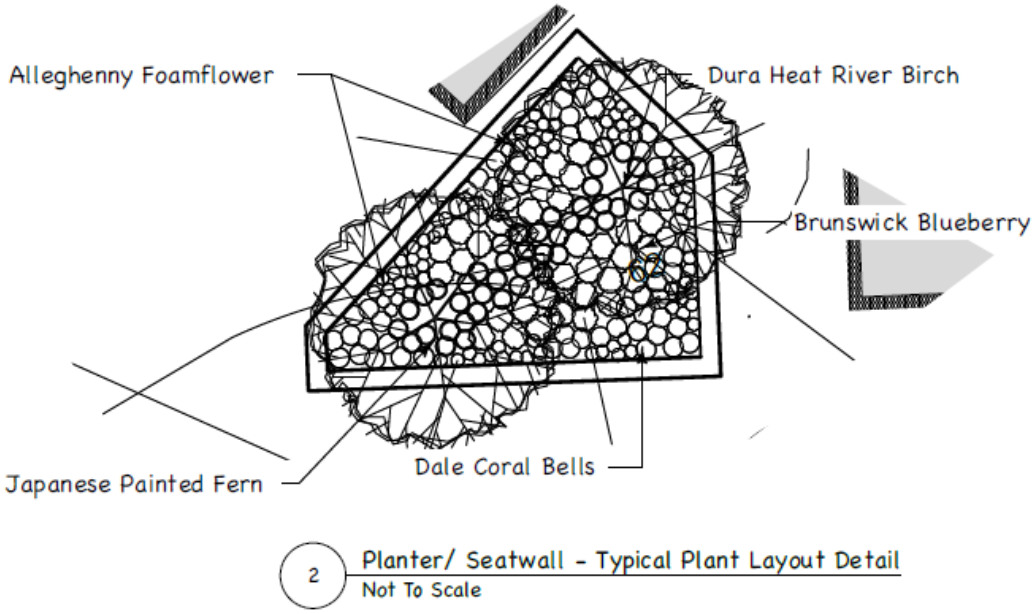
c. Public Transit Access

West Commercial Street does not currently fall within a METRO service route; therefore, service is not directly available at the site.

d. Parking

The proposed parking would provide 119 surface parking spaces consisting of 113 standard spaces and 6 handicap accessible spaces. The applicant is exploring the implementation of compact spaces in lieu of some standard spaces. The City Code requires 71 spaces based on a ratio of 1 space/400 SF. All new surface parking shall be paved. Porous pavement is proposed for much of the surface parking field.

e. Bicycle Parking



The applicant is proposing up to 20 bicycle spaces, and is requesting a waiver from the required 42 spaces. These changes have not yet been incorporated into the Site Plan, and will be subject to ongoing discussions.

2. Environmental Quality Standards

a. Preservation of Significant Natural Features

The site has been identified as habitat for the Long Nose Bat, which is a threatened species. The applicant has received the necessary permitting and paid a fee in lieu. The conditions of the permit state that any clearing must occur before April 19, 2020, which is the anticipated time the bats would return. Approximately 55 acres have been preserved to the north of the site as deer bed habitat.

b. Landscaping and Landscape Preservation

A landscaping plan was submitted by Barry Hosmer Landscape Architects as part of the application. The proposed parking lots will contain landscaping that is consistent with the City's technical standards. The applicant has attempted to reduce the footprint of the proposed development so as to limit disturbance to the existing landscape. The landscaping incorporates a variety of native plantings as well as other varieties. The landscape plan includes a note mandating that under no conditions may snow be plowed and piled on planting areas.

c. Water Quality, Storm Water Management and Erosion Control

The topography of the undeveloped site has several higher upland areas separated by pockets of wetlands. The native soil in this location are Hydrologic Soil Groups (HSG) C and D. Stormwater runoff from the site flows into the on-site wetlands and then off-site in 8 different locations. The site is in Zone X of FEMA's Flood Insurance Rate Map (FIRM), indicating that it is outside of the 500-year floodplain.

The proposed developed area which includes the proposed building, pavement and sidewalk (Post-Development sub catchments 9-20) totals 128,971 sf; of which 93,700 sf is new impervious surface and 35,270 sf is landscaped area. There will also be two outlet control structures that discharge to two analysis points. The runoff will discharge to the same points both pre and post development, with equal or decreased flows in the post development with no changes in existing channel geometry. Erosion and sedimentation control measures during construction are detailed within the design plans.

There is roughly 1,000 feet of vegetated buffer between the proposed site and the Stroudwater River, with pre-development flows exceeding the expected post-development flows for 2, 10, and 25-year storms. There is approximately 3,146 sf of wetland impact.

The project is required to comply with Maine DEP Chapter 500 and City of Portland Technical Manual Section 5 stormwater regulations. The project requires a Site Location of Development permit (SLODA). A Site Location of Development Act (SLODA) permit and a Natural Resources Protection Act (NRPA) Tier 2 Wetland Alteration permit were submitted on August 27, 2019. These permits were determined complete on September 18, 2019 and Jenifer McGill has been assigned as the project manager from the MDEP.

On November 13, 2019 Frank Del Giudice of the Army Corps of Engineers authorized the placement of fill in freshwater wetlands as indicated on the NRPA Wetland Alteration Permit.

3. Public Infrastructure and Community Safety Standards

a. Public Safety and Fire Prevention

The site would provide access from the primary driveway for emergency vehicles. Fire hydrants would be located along Andover Street. The facility would be fully sprinklered.

b. Availability and Adequate Capacity of Public Utilities

The Applicant is securing letters from the applicable utilities stating their ability to serve the site. The project will require new electrical, gas, sewer, and water services to the facility. An ability to serve letter has been requested from the Portland Water District, and a Wastewater Capacity Application has been approved by Brad Roland, P.E., Senior Project Engineer, at the City of Portland. (See Attachment I)

4. Site Design Standards

a. Snow and Ice Loading

Snow will be removed from the parking lots and stockpiled within the site perimeter or if necessary, removed from the site.

b. View Corridors

The site is not located within any corridors identified in the Downtown Vision View Corridor Protection Plan.

c. Historic Resources

The development is not located within a designated historic district.

d. Exterior Lighting

The applicant has submitted a photometric plan and has demonstrated that no light trespass will occur to neighboring properties. (See Attachment P.9 Lighting Photometric Plan)

e. Noise and Vibration

All heating, ventilation, air conditioning equipment including air handlers and generators are designed to meet local, state, and federal emissions and noise requirements. Most of the HVAC equipment is mounted in the middle of the roofs to minimize visibility. Any additional ground mounted equipment for the buildings will be screened.

f. Signage and Wayfinding

All signage shall meet the requirements of the Manual on Uniform Traffic Devices (MUTCD) and Division 22 of the City Code. The proposed hotel and commercial signage can be seen on the architectural renderings.

g. Zoning Related Design Standards

N/A

h. Construction Management Plan

The construction management plan continues to be reviewed by city staff. (See Attachment **P16. CONSTRUCTION MANAGEMENT PLAN)**

XII. NEXT STEPS

1. Address staff comments
2. Address additional comments of the Planning Board
3. Prepare final plan submission, including subdivision and site plan submittal requirements as included in 14-527(e) and (f) for review by the Planning Board
4. Hold Planning Board Hearing

Project Memo

Prepared for the City of Portland
Planning and Urban Development Department
Planning Division

Date: February 7, 2020

Project: 100 Andover Road – Maine Behavioral Healthcare
Project ID: PL-00030-2019

Attn: Andrew Tufts

Overview: This memo has been prepared in response to comments received from your office dated January 21, 2020 and amended on February 3, 2020. The responses follow the order in which that were written and will identify the reviewer and overall topic reviewed as well as a brief summary of the question with an answer to follow.

Mike Tremblay, DPW P.E. Senior Engineer

Site Plan/ Layout

Concrete sidewalk, north side of building: The site plan drawing has been revised and this revision is reflected on the January 22, 2020 submission.

Design vehicle: Passenger Vehicle: The site will be served primarily by passenger vehicles, a limited number of shuttle buses or vans may bring some students, and a trash vehicle will need to access the dumpster to the rear of the building. Deliveries are primarily anticipated to be from UPS, Fed Ex etc. and would access the building through the front door.

Mountable Curb: This is intended so that a service vehicle for the transformer or other mechanical equipment can back over the curb on to the path and proceed to the southeast corner of the building and park. Any vehicle will not block traffic.

Drop Off and Pick Up Circulation: The parking lot system was designed to have a separate drop off lane for students and patients with limited parking just south of the building, for safety purposes. The main travel way for staff, patients and parents is located south of the landscaped island. We feel for safety reasons this is a desirable layout.

Parking: The staff will use approximately 95 spaces, those would be to the rear of the building and along the periphery of the main travel way. The angular spaces in front, the handicap spaces, as well as a few spaces directly across from the handicap spaces will primary be used by patients, parents and visitors.

Sidewalk Ramp: This will be revised to 4' x 4' on the next drawing submission.

Bicycle Ramp: The project will utilized a "Dero" Bike Hitch and will be included in the next drawing submission.

ADA accessible parking spaces: This facility is not a hospital; it is a professional office building, medical use. Under US Access Board Chapter 5 Parking Spaces 208.2.1 *"Other types of medical facilities not located in hospitals, including doctors' offices, and independent clinics, are not subject to this requirement but to the regular scoping table".* The regular scoping table is "Minimum Number of Accessible Parking Spaces" Section 208.2. Based on this table we are required to provide 4 accessible spaces with 1 additional van space. This project has provided 6 universal handicap spaces.

Snow Storage: Snow storage is not intended to be placed in a wetland and the outline of the snow storage areas on drawing C-101 will be revised so that it does not overlap the wetland edge. We also encourage limited use of salt and anticipate it primarily being used in the sidewalk areas.

Grading and Drainage

Spot Grades: Most of the conflicts have been revised on the January 22, 2020 submission, but a couple more need to be revised.

Porous Pavement: We are aware that porous pavement requires maintenance and are entering into a 5 year maintenance agreement. The porous pavement was not considered pervious in the drainage calculations. See full stormwater management report with calculations submitted on January 30, 2020.

Diagonal Parking Spot Grades/ Drainage: See revised C-102 drawing submitted revised on the January 22, 2020.

Traffic

TMP: A traffic study was submitted on January 28, 2020 and a Scoping Meeting was held on February 6, 2020.

Ben Pearson, PE Water Resources Compliance Coordinator

Construction Management Plan (CMP): A dewatering plan needs to be added to the text of the CMP.

Lauren Swett - Civil

Building Footprint: These issues have been addressed and the revisions are reflected on drawing C-101 on the January 22, 2020 submission.

Grading/ Drainage structures: These issues have been addressed and the revisions are reflected on drawing C-102 on the January 22, 2020 submission.

Basic Standards: We will show the construction entrance on the Grading and Drainage plan in the next drawing submission.

General Standards: These issues have been addressed and the revisions are reflected on drawing C-102 on the January 22, 2020 submission.

Flooding Standards: See full stormwater management report with calculations submitted on January 30, 2020.

100 Andover Street

1 message

Mike Tremblay <mtremblay@portlandmaine.gov> Fri, Feb 21, 2020 at 10:28 AM
To: Andrew Tufts <atufts@portlandmaine.gov>

Andrew,

Here are my additional comments on 100 Andover Street:

- Per ADA, an accessible route to a building entrance must be provided from the sidewalk serving the site.

- While the site driveway is served by a private roadway and is thus not subject to the City of Portland's Technical Manual the driveway width is significantly wider than the 24-foot maximum width described in those standards. Excess driveway width encourages faster turning maneuvers and can be a safety issue, especially for pedestrians. Narrowing the driveway width is recommended. Given that the design vehicle is primarily passenger cars with some box trucks, a smaller driveway should be possible.

- Pick-up/drop-off activity, assumed circulation patterns, etc. should be marked on the site plan or, for clarity, a separate plan.

Mr. James Rather
Development Review Services Manager
4th Floor, City Hall
389 Congress Street
Portland, Maine 04101

Subject: Maine Behavioral Healthcare
Center of Excellence in Autism and Developmental Disorders
123 Andover Road
Chart, Block, Lot: 239A A003

Dear James,

On behalf of MaineHealth, dba Maine Behavioral Healthcare, we are pleased to submit this Level III Site Plan application along with supporting materials for your review and approval.

The subject property is part of the larger parcel of Spring Harbor Hospital, which was reviewed and approved by the City of Portland in 2002. The planned development will occupy a wooded and undeveloped portion of the site. The site is composed of a small knoll with surface water running off to the west to a small unnamed stream and to the north to the 50+ acre MDEP Deeryard. Approximately 1000' of wooded buffer is between the site and the Stroudwater River. To the east of the property is Hydro International, the recently purchased MaineHealth warehouse and professional office building and Hutchins Drive. To the south is APEX Racket and Fitness Club, the American Red Cross and Cross Insurance.

The proposed project consist of a 28,200 square foot single story building which will house outpatient services, professional offices as well as day treatment services and classrooms. Much of the care in this type of facility is on a one to one basis of provider and patient. The parking field consists of 113 standard spaces and 6 handicap accessible spaces comprising 51,530 square feet of impervious and permeable paving. The total area of the project is 93,700 square feet.

We look forward to working with the Planning Staff in the review of this project. Please feel free to contact me with any questions or concerns you may have regarding the uploaded application and materials.

LEVEL II AND LEVEL III SITE PLAN
STANDARDS AND SUBMISSION CHECKLIST

Provide assessment of compliance with standards and include supplemental documentation, as applicable
Please Submit each document as a separate PDF file

TRANSPORTATION

Yes	NA	
☑	☐	**Transportation Analysis- Traffic Impact (14-526 (a) 1)** • Provisions for pedestrian, bicycle, vehicle, and loading circulation and incremental volume of traffic impacts • Traffic Impact Study (Technical Manual, Section 1) if applicable
☑	☐	**Access and Circulation (14-526 (a) 2 a)** • Access and internal circulation, addressing ADA access • Access and egress impacts on traffic flows • Description and use of drive-up features, if applicable
☐	☑	**Loading and Servicing (14-526 (a) 2 b)** • Loading and servicing needs, route and travel way geometrics for deliveries • Turning templates for delivery vehicles, if applicable
☑	☐	**Sidewalks (14-526 (a) 2 c)** • Sidewalks and condition along street frontages and internal walkways • Engineered details for ADA ramps and public sidewalk details meeting sidewalk materials policy and ADA ramp construction details as applicable (Technical Manual, Section 1)
☐	☑	**Public Transit (14-526 (a) 3), if applicable** • Existing available transit services • Proposed site plan design details, such as easement, pad base, and shelter
☑	☐	**Off-Street Parking: Vehicle & Motorcycle/Scooter) (14-526 (a) 4 a and c)** • Expected parking demand, proposed parking supply, ADA parking, and applicable Zoning Requirements • Address Technical Manual standards (Section 1) for curb cut separation and parking lot layout and locate on site plan
☑	☐	**Bicycle Parking (14-526 (a) 4 b)** • Address bicycle parking requirements and identify locations on-site • Construction details for bike racks (Technical Manual, Section 1)
☑	☐	**Snow Storage (14-526 (a) 4 d)** • Management plan for snow removal and locate snow storage areas on plan
☐	☑	**Traffic Demand Management (TDM) (14-526 (a) 5), if applicable** • Develop TDM with Trip Reduction Targets and Strategies

ENVIRONMENTAL AND LANDSCAPE FEATURES	
Yes ☐ NA ☑	**Preservation of Significant Natural Features (14-526 (b) 1), if applicable** • Trees, plants, habitats listed on State or Federal list of endangered or threatened • High and moderate value waterfowl and wading habitat • Aquifers on Casco Bay Islands • Waterbodies (including wetlands, watercourses, significant vernal pools and floodplains) • Proposed preservation areas and protection measures • Documentation from environmental consultants, determinations from applicable state agencies
Yes ☑ NA ☐	**Landscaping and Landscape Preservation (14-526 (b) 2 a)** • Preservation of trees and preservation within required zoning setbacks (Technical Manual, Section 4) • Protection measures of existing vegetation during construction • Protection measures within Shoreland Zone, if applicable
Yes ☑ NA ☐	**Site Landscaping (14-526 (b) 2 b)** • Screening and buffering of service areas and between non-residential and residential uses • Planting plans with plant schedule and sizes (Technical Manual, Section 4)
Yes ☑ NA ☐	**Parking Lot Landscaping (14-526 (b) 2 b ii), if applicable** • Landscaped islands within parking areas (Technical Manual, Section 4)
Yes ☐ NA ☑	**Street Trees (14-526 (b) 2 b iii)** • Existing Heritage or Feature Trees on site and measures to preserve • Identify street trees on the plan meeting the site plan and Technical Manual standards (Section 4) or identify alternative measures, if applicable
ENVIRONMENTAL AND STORMWATER	
Yes ☑ NA ☐	**Water Quality, Stormwater Management and Erosion Control (14-526 (b)3 a)** • Stormwater report in compliance with Section 5 of Technical Manual and DEP Chapter 500 stormwater for basic, general and flooding standards, as applicable • Erosion control plan and measures • Evidence of compliance with Urban Impaired Stream Standards pursuant to DEP Chapter 500 stormwater, as applicable • Subsurface sanitary sewage disposal and groundwater protection

PUBLIC INFRASTRUCTURE AND SAFETY	
Yes ☐ NA ☑	**Consistency with City Master Plans (14-526 (c) 1)** • Identify consistency with master plans • Proposed easements, rights and improvements to connect or continue off-premises public infrastructure, as applicable
Yes ☑ NA ☐	**Public Safety and Fire Prevention (14-526 (c))** • Address Crime Prevention through Environmental Design (CPTED) (Technical Manual, Section 3) • Emergency vehicle access • Address consistency with public safety standards (Technical Manual, Section 3) • Submit a code summary referring NFPA 1 and all Fire Department standards (Technical Manual, Section 3) – Fire Checklist
Yes ☑ NA ☐	**Availability and Adequacy of Public Utilities (14-526 (c) 3) (Technical Manual, Sections 2 & 9)** • Electrical services, including providing underground services • Identify existing and proposed connections for public utilities and required public utility upgrades • Sewer line connections are required, if there is a main within 200 feet • Proposed solid waste management facilities on-site and management for the site • Written evidence of the ability to serve from utility companies, as applicable
SITE DESIGN	
Yes ☐ NA ☑	**Massing, Ventilations and Wind Impact (14-526 (d) 1)** • Wind and ventilation impacts on adjoining structures and/or adjacent public spaces. Wind study, if applicable • Bulk, location or height impacts on adjoining structures • Identify and locate HVAC equipment and venting away from public spaces and residential properties • Identify screening and manufacturing specifications for noise, if applicable
Yes ☐ NA ☑	**Shadows (14-526 (d) 2), if applicable** • Shadow analysis of impacts on publicly accessible open space (Technical Manual, Section 11)
Yes ☐ NA ☑	**Snow and Ice Loading (14-526 (d) 3)** • Building design to prevent snow and ice from loading or falling onto adjacent properties or public ways
Yes ☐ NA ☑	**View Corridors (14-526 (d) 4), if applicable** • Protection of designated view corridors (Portland Design Manual, Appen. 1)

Yes ☐ NA ☑	**Historic Resources (14-526 (d) 5), if applicable** • Identify developments within Historic Districts or affecting Designated Landmarks • Certificate of Appropriateness or other evidence • Identify Developments within 100 feet of Historic Districts or affecting Designated Landmarks. Advisory HP review may be required • Address preservation and documentation of Archaeological Resources
Yes ☑ NA ☐	**Exterior Lighting (14-526 (d) 6)** • Cut sheets of on-site light fixtures and any architectural or specialty lights (Technical Manual, Section 12) • Engineered details for any lights proposed in street right-of-way (Technical Manual, Section 10)
Yes ☐ NA ☑	**Noise and Vibration (14-526 (d) 7)** • Evidence of noise levels for equipment, such as equipment specifications, to demonstrate consistency with zoning requirements
Yes ☐ NA ☑	**Signage and Wayfinding (14-526 (d) 8), if applicable** • Signage plan showing the location, dimensions, height and setback of all existing and proposed signs. Signs in Historic Districts are reviewed by Historic Preservation staff • Proposed commercial and directional signage on site
Yes ☑ NA ☐	**Zone Related Design Standards (14-526 (d) 5)** • Address Historic Preservation Design Review, if applicable • Address any applicable design review standards by zone • Address submission requirements from Design Manual, page 1, addressing neighborhood context • Description of exterior materials, color, finish, and samples
Construction Management Plan	
Yes ☑ NA ☐	**Construction Management Plan** • Construction Management Document and Plan

LEVEL II AND LEVEL III SITE PLAN
DRAWINGS CHECKLIST

Please upload the following DRAWINGS with the listed details into e-Plan as separate pdfs

RECENT BOUNDARY SURVEY (stamped by Maine Licensed Surveyor)

- [x] Must be in compliance with Technical Manual, Section 13

SITE PLAN(s) (stamped by Maine Licensed Engineer) including:

Existing Conditions

- [x] Approximate location of structures on abutting property
- [x] Topography
- [x] Locate water courses
- [x] Delineate wetlands
- [x] Zone lines

Proposed Site Plan

- [x] Ground floor area, and grade elevations for all buildings

Access, Circulation, and Parking

- [ ] Streets and intersections adjacent to site, any proposed geometric modifications
- [x] Location, dimensions and materials of all existing and proposed driveways, vehicle, bicycle, & pedestrian access ways with corresponding curb lines
- [x] Engineered specifications/ cross-sections for proposed driveways, sidewalks & paved areas
- [ ] Location and dimensions of proposed loading areas
- [ ] Existing and proposed transit infrastructure with dimensions/ engineering specifications
- [x] Location of vehicle and bicycle parking with dimensions and engineering specifications

Site Considerations

- [x] Identify snow storage areas
- [x] Location of fire hydrants
- [x] Location of solid waste management facilities

UTILITY PLAN including:

- [x] Existing utilities on site and within public streets
- [x] Location, sizing and directional flows of all existing and proposed utilities
- [ ] Location and dimensions of off-premises public or publicly accessible infrastructure adjacent to site
- [x] Electric utility infrastructure

GRADING AND DRAINAGE PLAN including:

- [x] Existing grades and drainage
- [x] Proposed grades
- [x] Proposed stormwater management meeting Technical Manual (Section 5), standards
- [ ] Location and proposed alteration of a water course
- [x] Preservation or alteration of wetlands

EROSION CONTROL

- [x] Must be in compliance with Technical Manual, Section 5

LANDSCAPE PLAN including:

- [x] Existing vegetation to be preserved and preservation measures
- [x] Proposed landscaping and buffers
- [x] Planting schedule

RECORDING PLAT, if applicable
☐ If Subdivision, must be in compliance with requirements of Section 14-496 (b)
ARCHITECTURAL PLANS AND RENDERINGS including:
☑ Exterior building elevations, color renderings, illustrations of all sides
☑ Location and dimensions of all existing and proposed HVAC and mechanical equipment, all proposed screening
☐ Provide context drawings, if applicable (Design Manual, page 1)
☑ Floor plans

Section 2
Title, Right or Interest

Overview:

Chapter 372 §§ 9 of the Site Law Regulations requires that an applicant for approval has demonstrated sufficient title, right or interest in the property, which is proposed for development or use.

A. Conclusion

The deed between George M Hutchins and Spring Harbor Hospital, a member of MaineHealth, is attached Book 1740 Page 106 and executed and recorded on March 8 2002

B. Attachments

Warranty Deed with attached Exhibit A between George M Hutchins and Spring Harbor Hospital.

0019509 BK17401PG106

WARRANTY DEED

(Maine Statutory Short Form)

KNOW ALL MEN BY THESE PRESENTS, That **GEORGE M. HUTCHINS**, of Falmouth, Maine for consideration paid, grants to **SPRING HARBOR HOSPITAL**, a Maine Business Corporation with a place of business at 465 Congress St., Portland, Maine, with **WARRANTY COVENANTS**, the land located in Portland and Westbrook, County of Cumberland, State of Maine , bounded and described as follows:

SEE EXHIBIT "A" ATTACHED HERETO
MADE A PART HEREOF AND INCORPORATED BY REFERENCE HEREIN

MAINE REAL ESTATE TAX PAID

WITNESS my hand and seal this 8TH day of March, 2002

George M. Hutchins
GEORGE M. HUTCHINS

STATE OF MAINE
CUMBERLAND, ss.

March 8, 2002

Then personally appeared the above named George M. Hutchins and acknowledged the foregoing instrument to be his free act and deed.

Before me,

~~Notary Public~~
ATTORNEY

Printed Name: DANIEL J. DESMOND

EXHIBIT A

Three lots or parcels of land being located partially in the City of Portland and partially in the City of Westbrook, in the County of Cumberland, State of Maine, bounded and described as follows:

PARCEL 1

Being Lot 100 as shown on plan entitled, "Master Plan Standard Boundary Survey – Subdivision – Stroudwater Estates on Hutchins Drive & Harry Harmon Drive Portland, Maine made for George Hutchins", dated October 29, 1998 and updated to June 26, 2001 by Owen Haskell, Inc. to be recorded in the Cumberland County Registry of Deeds.

EXCEPTING a 35,279 square foot parcel as shown on the above mentioned plan as to be added to Lot 9.

PARCEL 2

Being Lot 200 as shown on plan entitled, "Master Plan Standard Boundary Survey – Subdivision – Stroudwater Estates on Hutchins Drive & Harry Harmon Drive Portland, Maine made for George Hutchins", dated October 29, 1998 and updated to June 26, 2001 by Owen Haskell, Inc. to be recorded in the Cumberland County Registry of Deeds.

PARCEL 3

Being Lot 34 as shown on plan entitled, "Master Plan Standard Boundary Survey – Subdivision – Stroudwater Estates on Hutchins Drive & Harry Harmon Drive Portland, Maine made for George Hutchins", dated October 29, 1998 and updated to June 26, 2001 by Owen Haskell, Inc. to be recorded in the Cumberland County Registry of Deeds.

EXCEPTING from Lot 34 such portion as was conveyed to the Portland Water District by deeds recorded in Book 2411, Page 133 and Book 2411, Page 136.

TOGETHER with another Lot or parcel of land adjacent to Lot 34 and being bounded and described as follows:

Beginning on the easterly side of Hutchins Drive at the northwesterly corner of land formerly of Robert Pazolt as described in the deed recorded in Book 7559, Page 210 of the Cumberland County Registry of Deeds;

Thence, North 86° 34' 35" East, along land formerly of Robert Pazolt, 270.00 feet to Lot 34 on the above mentioned plan;

Thence, North 12° 18' 20" West, along Lot 34 on the above mentioned plan, 297.56 feet;

Thence, North 72° 25' 25" West, along Lot 34 on the above mentioned plan, 240.00 feet to the easterly side of Hutchins Drive;

Thence, South 3° 25' 25" East, along the easterly side of Hutchins Drive, 380.00 feet to the point of beginning.

Containing 1.89 acres, more or less

Parcel 3 (Lot 34 and adjacent parcel of 1.89 acres) is subject to a "conservation easement" granted to the State of Maine Department of Inland Fisheries and Wildlife as described in deeds recorded in the Cumberland County Registry of Deeds in Book 11061, Page 285 and Book 11306, Page 220.

Parcel 3 as described above is a gift from George M. Hutchins to Spring Harbor Hospital.

Section 3
Financial Capacity

Overview:

Chapter 373 §§ 1 (B) of the Site Law Regulations requires that applications for project approval demonstrate that the developer has the financial capacity to construct, operate and maintain all aspects of the proposed development.

A. Estimated Cost

The total construction cost is anticipated to be 11,900,000

B. Financing

Attached is the Line of Credit Note from TD Bank, N.A. to MaineHealth in the amount of $50,000,000.

Conclusion

MaineHealth has demonstrated that they have the financial capacity to construct, operate and maintain all aspects of the development.

LOAN # 857482 - 0101

LINE OF CREDIT LOAN NOTE

Date of Note: January 1, 2019

Principal Amount: $50,000,000.00

Definitions	
Business Day:	Any day of the year other than (i) a day that is a Saturday or Sunday, (ii) a day that is a legal holiday or a day on which banking institutions located in Portland, Maine are required or authorized to remain closed, (iii) a day on which the Federal Reserve System is not in operation; or (iv) any day on which commercial banks are not open for general business (including dealings in foreign exchange and foreign currency deposits) in London, England.
Default Rate:	A rate of interest equal to the Interest Rate provided herein plus four (4%) percent per annum, but in no event to exceed the maximum rate allowed by law.
Interest Rate: (LIBOR)	An interest rate equal to Fifty Five Basis Points (0.55%) per annum (the "**Margin**") in excess of the rate of interest per annum of the one (1) month LIBOR (as defined below) for any LIBOR Interest Period (as hereinafter defined). The Bank shall not be required to notify Borrower of adjustments in said interest rate. Notwithstanding the foregoing, or any other provision of this Note, if Bank shall reasonably determine (which determination shall be conclusive and binding absent manifest error) that, (i) by reason of circumstances affecting the relevant market, reasonable and adequate means do not exist for ascertaining LIBOR, or (ii) LIBOR does not adequately and fairly reflect the cost to Bank of funding the loan evidenced hereby, or (iii) it is unlawful for Bank to extend or maintain any loan evidenced hereby as a loan subject to LIBOR, Bank shall give prompt written notice thereof to Borrower and after the giving of such notice, until any such notice has been withdrawn by Bank, any loan evidenced hereby the shall bear interest at another index and margin or rate of interest then designated by Bank, in its reasonable discretion, that provides a comparable rate of interest.

LIBOR	The London Interbank Offered Rate rate of interest in U.S. Dollars (rounded upwards, at the Bank's option, to the next 1/8th of one percent) equal to the rate established by the Intercontinental Exchange Benchmark Administration, Ltd. ("**ICE**" or the successor thereto if ICE is no longer making a London Interbank Offered Rate available) as published by Bloomberg (or such other commercially available source providing quotations of LIBOR), as determined by the Bank (as hereafter defined) and in effect two (2) Business Days before the date of this Note and before the commencement of each LIBOR Interest Period (as defined below), provided however, if more than one LIBOR is specified, the applicable rate shall be the arithmetic mean of all such rates. London Business Days means any day on which commercial banks are open for general business (including dealings in foreign exchange and foreign currency deposits) in London, England. If, for any reason, such rate is not available, the term LIBOR shall mean, with respect to any LIBOR Interest Period, the rate of interest per annum determined by Bank to be the average rate per annum at which deposits in dollars are offered for such Interest Period by major banks in London, England at approximately 11:00 A.M. (London time) two (2) Business Days prior to the commencement of each LIBOR Interest Period. Interest shall be computed on an actual/360 day basis (i.e., interest for each day during which the Principal Amount, or any part thereof, is outstanding shall be computed at Interest Rate divided by 360). Notwithstanding the foregoing, LIBOR rate loans shall be deemed to constitute "**eurocurrency liabilities**" and as such shall be deemed subject to reserve requirements without benefits of credits for proration, exceptions or offsets that may be available from time to time to Bank. The LIBOR rate shall be adjusted automatically on and as of the effective date of any change in the LIBOR Reserve Percentage or the LIBOR Interest Period for each LIBOR rate loan comprising part of the same borrowing (including conversions, extensions and renewals), to a per annum interest rate determined pursuant to the following formula: Adjusted LIBOR Rate = $\frac{\text{LIBOR Rate}}{\text{1 - LIBOR Reserve Percentage}}$ For purposes of this calculation **LIBOR Reserve Percentage** is defined as, for any day, that percentage (expressed as a decimal) which is in effect from time to time under Regulation D, as such regulation may be amended from time to time or any successor regulation, as the maximum reserve requirement (including, without limitation, any basic, supplemental, emergency, special, or marginal

	reserves) applicable with respect to eurocurrency liabilities as that term is defined in Regulation D (or against any other category of liabilities that includes deposits by reference to which the interest rate of LIBOR rate loans is determined), whether or not Bank has any eurocurrency liabilities subject to such reserve requirement at that time.
LIBOR Interest Period:	Initially, the first (1st) LIBOR Interest Period hereunder shall be the period (A) commencing on the date hereof and ending on (and including) the last day of the calendar month in which this Note is dated; or (B) the first day of the month selected by Borrower as the first month for which LIBOR will be the Interest Rate hereunder and ending on (and including) the last day of such calendar month. Thereafter, each LIBOR Interest Period shall commence on the first (1st) day of the calendar month immediately following the previous LIBOR Interest Period and shall end on (and include) the last calendar day of each such calendar month thereafter, provided however, no LIBOR Interest Period shall extend beyond the Maturity Date.
Maturity Date:	June 30, 2020
State:	The State of Maine

FOR VALUE RECEIVED, MaineHealth, a Maine nonprofit corporation (the "**Borrower**"), having an address as indicated below, **HEREBY PROMISES TO PAY** to the order of TD Bank, N.A., a national banking association, (hereinafter, together with its successors and assigns, referred to as the "**Bank**") at P.O. Box 5600, Lewiston, Maine 04243-5600, or at such other place as the holder hereof may from time to time designate in writing, in immediately available federal funds, the Principal Amount, which Principal Amount shall be due and payable on the Maturity Date, together with interest on the outstanding Principal Amount from time to time at the Interest Rate until this Note is paid in full, which interest shall be payable monthly commencing on the first day of the month following the Date of the Note and on the first day of each successive month thereafter until this Note is paid in full. On the Maturity Date the then outstanding Principal Amount, together with all accrued interest thereon, shall be due and payable.

If any present or future law, governmental rule, regulation, policy, guideline, directive or similar requirement (whether or not having the force of law) imposes, modifies, or deems applicable any capital adequacy, capital maintenance or similar requirement which affects the manner in which Bank allocates capital resources to its commitments (including any commitments hereunder), and as a result thereof, in the opinion of Bank, the rate of return on Bank's capital with regard to this Note is reduced to a level below that which Bank could have achieved but for such circumstances, then in such case and, upon notice from Bank to Borrower, from time to time, Borrower shall pay Bank such additional amount or amounts as shall compensate Bank for such

reduction in Bank's rate of return; provided, however, that Bank shall do so only if it is assessing such additional amount or amounts with respect to similarly situated borrowers. Such notice shall contain the statement of Bank with regard to any such amount or amounts which shall, in the absence of manifest error, be binding upon Borrower. Provided that Bank is acting as set forth above with respect to assessing such amount or amounts, in determining such amount, Bank may use any reasonable method of averaging and attribution that it deems applicable. For the avoidance of doubt, the foregoing provisions shall apply to all requests, rules, regulations, guidelines or directives concerning capital adequacy issued in connection with the Dodd–Frank Wall Street Reform and Consumer Protection Act and all requests, rules, regulations, guidelines or directives concerning capital adequacy promulgated by the Bank for International Settlements, the Basel Committee on Banking Regulations and Supervisory Practices (or any successor or similar authority) or the United States financial regulatory authorities, regardless of the date adopted, issued, promulgated or implemented.

If, after the date hereof, any (a) adoption of, or change in, United States federal, state or foreign laws, regulations or treaties, or any governmental or quasi-governmental rules, regulations, policies, guidelines, requests or directives (whether or not having the force of law), including the Dodd-Frank Wall Street Reform and Consumer Protection Act and all requests, rules, regulations, guidelines or directives issued in connection therewith regardless of the date enacted, adopted or issued, or (b) change in the interpretation, promulgation, implementation or administration of or under any United States federal, state or foreign laws, regulations or treaties, or any governmental or quasi-governmental rules, regulations, policies, guidelines, requests or directives (whether or not having the force of law), including the Dodd-Frank Wall Street Reform and Consumer Protection Act and all requests, rules, regulations, guidelines or directives issued in connection therewith regardless of the date enacted, adopted or issued, by any court, governmental, quasi-governmental, central bank or comparable agency or monetary authority that is charged with the interpretation or administration thereof, shall (1) subject Bank to any tax of any kind whatsoever with respect to any loans made by it, or change the basis of taxation of payments to Bank in respect thereof (except for changes in the rate of tax on the overall net income of Bank); (2) impose, modify, or hold applicable, any reserve, special deposit, compulsory loan, or similar requirement against assets held by, deposits or other liabilities in, or for the account of, advances, loans, or other extension of credit (including participations therein) by, or any other acquisition of funds by, any office of Bank which is not otherwise included in the determination of rate under the Note; or (3) shall impose on such Bank any other condition; and the result of any of the foregoing is to materially increase the cost to Bank of making or maintaining the loan evidenced by the Note, or to reduce any amount receivable under the Note, or any other Loan Document, then, in any such case, Borrower shall promptly pay Bank, upon its demand, any additional amounts necessary to compensate Bank for such additional costs or reduced amount receivable which Bank reasonably deems to be material as determined by Bank, with respect to the Loan. A certificate as to any additional amounts payable pursuant to this paragraph submitted by Bank to Borrower shall be presumptive evidence of such amounts owing.

Bank agrees to use reasonable efforts to avoid, or to minimize, any amounts which might otherwise be payable pursuant to this paragraph provided however, that such efforts shall not cause the imposition on Bank of any additional costs or legal regulatory burdens deemed by Bank in good faith to be material.

The Borrower and each endorser and guarantor hereof grant to the Bank a continuing lien on and security interest in any and all deposits or other sums at any time credited by or due from the Bank or any Bank Affiliate (as hereinafter defined) to the Borrower and/or each endorser or guarantor hereof and any cash, securities, instruments or other property of the Borrower and each endorser and guarantor hereof in the possession of the Bank or any Bank Affiliate, whether for safekeeping or otherwise, or in transit to or from the Bank or any Bank Affiliate (regardless of the reason the Bank or Bank Affiliate had received the same or whether the Bank or Bank Affiliate has conditionally released the same) as security for the full and punctual payment and performance of all of the liabilities and obligations of the Borrower and/or any endorser or guarantor hereof to the Bank or any Bank Affiliate and such deposits and other sums may be applied or set off against such liabilities and obligations of the Borrower or any endorser or guarantor hereof to the Bank or any Bank Affiliate at any time, whether or not such are then due, whether or not demand has been made and whether or not other collateral is then available to the Bank or any Bank Affiliate.

Notwithstanding anything to the contrary herein, whenever any payment to be made under this Note shall be stated to be due on a day that is not a Business Day, such payment may be made on the next succeeding Business Day, and such extension of time shall in such case be included in the computations of payment of interest.

This Note is secured by, and the holder is entitled to the benefits and security of, that certain Line of Credit Agreement (the **"Loan Agreement")** of even date herewith between Borrower and Bank.

Upon the occurrence of any Event of Default (as defined in the Loan Agreement), Bank may exercise any and all rights and remedies under the Loan Agreement (including without limitation, rights to accelerate the Loan), or available at law or equity, or both. Borrower shall be obligated to reimburse Bank for Bank's Expenses (as defined and provided for in the Loan Agreement), incurred by Bank. From and after the occurrence of any Event of Default, the interest rate of this Note shall be at the Default Rate.

In no event shall the total of all charges payable under this Note, the Loan Agreement and any other documents executed and delivered in connection herewith and therewith that are or could be held to be in the nature of interest exceed the maximum rate permitted to be charged by applicable law. Should Bank receive any payment that is or would be in excess of that permitted to be charged under any such applicable law, such payment shall have been, and shall be deemed to have been, made in error and shall thereupon be applied to reduce the principal balance outstanding on this Note.

This Note may be prepaid, in whole or in part without a prepayment premium, so long as (i) Bank is given not less than three (3) Business Days' notice of such prepayment, (ii) each prepayment is accompanied by the payment of accrued and unpaid interest on the principal amount prepaid together with all costs and expenses attributable to such prepayment (iii) each prepayment is made in immediately available federal funds and (iv) the prepayment occurs on the last day of a LIBOR Interest Period.

Borrower waives demand, presentment for payment, notice of dishonor, protest and notice of protest of this Note.

Any notice, demand or request relating to any matter set forth in this Note shall be given in the manner provided for in the Loan Agreement. Time is of the essence as to all dates set forth herein.

This Note may not be waived, changed, modified, terminated or discharged orally, but only by an agreement in writing signed by the party against whom enforcement of any such waiver, change, modification, termination or discharge is sought.

Bank is subject to the requirements of the USA Patriot Act (Title III of Pub. L. 107-56) (signed into law October 26, 2001)) (the "Act") and hereby notifies the Borrower that pursuant to the requirements of the Act, it is required to obtain, verify and record information that identifies the Borrower, which information includes the name and address of the Borrower and other information that will allow Bank to identify the Borrower in accordance with the Act.

BORROWER HEREBY KNOWINGLY, VOLUNTARILY AND INTENTIONALLY WAIVES THE RIGHT TO A TRIAL BY JURY TO THE EXTENT THAT ANY SUCH RIGHT SHALL NOW OR HEREAFTER EXIST IN RESPECT OF ANY LITIGATION BASED ON THIS NOTE, ARISING OUT OF, UNDER OR IN CONNECTION WITH THIS NOTE OR ANY OTHER LOAN DOCUMENTS CONTEMPLATED TO BE EXECUTED IN CONNECTION HEREWITH, OR ANY COURSE OF CONDUCT, COURSE OF DEALINGS, STATEMENTS (WHETHER VERBAL OR WRITTEN) OR ACTIONS OF ANY PARTY. THIS WAIVER IS INTENDED TO ENCOMPASS INDIVIDUALLY EACH INSTANCE AND EACH ISSUE AS TO WHICH THE RIGHT TO A TRIAL BY JURY WOULD OTHERWISE ACCRUE CONSTITUTES A MATERIAL INDUCEMENT FOR BORROWER AND BANK TO ENTER INTO THE TRANSACTIONS CONTEMPLATED HEREBY. BANK IS HEREBY AUTHORIZED TO FILE A COPY OF THIS PARAGRAPH IN ANY PROCEEDING AS CONCLUSIVE EVIDENCE OF THIS WAIVER.

BORROWER HEREBY EXPRESSLY AND UNCONDITIONALLY WAIVES, IN CONNECTION WITH ANY SUIT, ACTION OR PROCEEDING BROUGHT BY OR ON BEHALF OF BANK ON THIS NOTE, ANY AND EVERY RIGHT BORROWER MAY HAVE (I) TO OBJECT TO THE JURISDICTION OR VENUE OF ANY STATE COURT

SITTING IN PORTLAND, MAINE OR ANY FEDERAL COURT LOCATED IN THE STATE, (II) TO INJUNCTIVE RELIEF, (III) TO INTERPOSE ANY COUNTERCLAIM THEREIN (OTHER THAN COMPULSORY COUNTERCLAIMS), AND (IV) TO HAVE THE SAME CONSOLIDATED WITH ANY OTHER OR SEPARATE SUIT, ACTION OR PROCEEDING. BORROWER HEREBY AGREES AND CONSENTS, IN ADDITION TO ANY METHODS OF SERVICE OF PROCESS PROVIDED FOR UNDER APPLICABLE LAW, ALL TO SERVICE OF PROCESS IN ANY SUCH SUIT BEING MADE UPON BORROWER BY MAIL AT THE ADDRESS SET FORTH IN THE LOAN AGREEMENT, AND SERVICE SO MADE SHALL BE COMPLETE TEN (10) DAYS AFTER THE SAME SHALL HAVE BEEN SO MAILED. THE FOREGOING WAIVERS ARE GIVEN KNOWINGLY AND VOLUNTARILY BY BORROWER. BANK IS HEREBY AUTHORIZED TO FILE A COPY OF THIS PARAGRAPH IN ANY PROCEEDING AS CONCLUSIVE EVIDENCE OF ANY OR ALL OF THE FOREGOING WAIVERS.

This Note and the rights and obligations of the parties hereunder shall in all respects be governed by, and construed and enforced in accordance with, the laws of the State (without giving effect to the State's principles of conflicts of law).

This Note evidences a loan for business and commercial purposes, and not for personal, family or household purposes. No invalidity or unenforceability of any portion of this Note shall affect the validity or enforceability of the remaining portions hereof. This Note shall take effect as a sealed instrument, as of the date first set forth above, regardless of the actual date of execution and delivery.

[NO FURTHER TEXT ON THIS PAGE]

IN WITNESS WHEREOF, the Borrower has executed and delivered this Note on the Date set forth above.

NOTICE OF INTENT TO FILE

Please take notice that Maine Behavioral Healthcare, Attn: Dennis Morelli, 22 Bramhall Street, Portland, ME 04102 Telephone (207) 662-6149 is intending to file a Traffic Movement Permit application with the City of Portland Department of Planning and Urban Development pursuant to the provisions of 23 M.R.S.A. § 704-A on or about December 18, 2019.

The application is for the Maine Behavioral Health Center of Excellence in Autism and Development Disorders at 100 Andover Road in Portland, Maine. The proposed health center will be 29,104 square feet in size. Construction is expected to begin in April of 2020 with occupancy planned for July 2021. The health center is expected to generate approximately 114 one-way trips during their weekday AM peak hour and 128 trips during their PM peak hour.

A request for a public hearing must be received by The City of Portland, in writing, no later than 20 days after the application is found by the City to be complete and is accepted for processing. Public comment on the application will be accepted throughout the processing of the application.

The application will be filed for public inspection at Department of Planning and Urban Development, which is located Portland City Hall, 389 Congress Street, Portland, Maine 04101, during normal working hours. A copy of the application may also be seen at the Maine Department of Transportation Southern Region 1 Office, 51 Pleasant Hill Road, Scarborough, ME 04070-0358.

Written public comments may be sent to the Department of Planning and Urban Development, City of Portland, 389 Congress Street, Portland, Maine 04101.

INTRODUCTION

The purpose of this application is to summarize the information required in a Traffic Movement Permit application to request a Scoping Meeting for a proposed new medical facility on Andover Road in Portland, Maine. Trip generation analysis shows that the new Maine Behavioral Health Center of Excellence in Autism and Development Disorders will generate in excess of 100 new peak hour trips. As a result, the project requires a Traffic Movement Permit (TMP) from the Maine Department of Transportation (MaineDOT). The City of Portland has Delegated Review Authority to review the application materials and issue the TMP on behalf of MaineDOT.

SITE DESCRIPTION - SECTION 1A

The proposed site is located at 100 Andover Road in Portland. The overall parcel is approximately 10.16 acres in size, based upon the survey plan prepared by Owen Haskell, Inc., which is included with this application. The existing terrain has several small hills with wetlands located in between them towards the middle of the parcel.

EXISTING AND PROPOSED USES - SECTION 1B

This parcel is currently vacant. The proposed medical facility will be 29,104 square feet in size and is expected to employ 117 persons.

SITE VICINITY - SECTION 1C

The site location and vicinity are shown on the map in Figure 1.

OTHER DEVELOPMENT - SECTION 1D

The City of Portland Department of Planning and Urban Development was contacted to request information regarding other proposed or approved developments that are expected to significantly impact traffic volumes in the study area. The City has not yet responded so other development projects will be identified and discussed at the Scoping Meeting.

TRIP GENERATION - SECTION 1E

The number of trips to be generated by the new medical facility was estimated using both the Institute of Transportation Engineers (ITE) "Trip Generation, 7th Edition" report, the edition being utilized by MaineDOT for traffic permitting purposes, and the newer 10th edition report since it is based upon a greater amount of information and considered more current and up to date. The results, based upon land use code 720 – Medical-Dental Office Building, calculated on the bases of 29,104 sf and 117 employees, are shown below:

	ITE Trip Generation (one-way trip ends)					
	7th Ed.			**10th Ed.**		
Time Period	Emp.	S.F.	Avg.	S.F.	Emp.	Avg.
Weekday	1,042	1,052	1,048	1,012	1,018	1,016
AM Peak Hour – Adj. Street	62	72	67	81	80	80
Entering	49	57	53	61	62	62
Exiting	13	15	14	18	18	18
AM Peak Hour – Generator	94	105	100	103	125	114
Entering	61	69	65	64	76	70
Exiting	33	36	35	39	49	44
PM Peak Hour – Adj. Street	124	108	116	101	113	107
Entering	42	29	35	28	39	33
Exiting	82	79	81	73	74	74
PM Peak Hour – Generator	124	130	127	120	135	128
Entering	42	52	47	47	54	51
Exiting	82	78	80	73	81	77

As seen above, the employee and square footage bases yielded similar results so they were averaged. Based upon both the 7th Edition and the newer more current 10th Edition, the project is expected 100 or more trips during both the weekday AM and PM peak hour. As a result, the proposed medical facility requires a TMP. Given the proposed medical office type use it was assumed that all trips are primary (or new) trips with no pass-by trips. The newer 10th edition generally yielded higher results and is considered more current so it is expected that the traffic study and analysis will be based upon these trip estimates.

TRIP DISTRIBUTION AND ASSIGNMENT - SECTION 1F & G

Turning movement/classification counts were conducted by Sewall/Maine Traffic Resources during the AM (7:00 – 9:00 AM) and PM (3:00 – 6:00) peak hour periods at the intersection of Congress Street, Hutchins Drive and Skyway Drive. The AM peak hour occurred from 7:30 – 8:30 while the PM peak hour occurred from 4:15 – 5:15.
The count records are included in this application.

The count data was factored to 30th highest hour volumes, the volumes typically used for design and traffic analysis purposes, using published MaineDOT group mean urban factors. The existing 2019 volumes, expected to be representative of peak summer volumes in late July or early August, are shown in Figure 2.

The trips for the AM and PM peak hour periods were assigned to the area intersections based upon the traffic patterns recorded during the counts. The resulting trip assignments are shown in Figure 3 for the AM and PM peak hours.

ACCIDENT REVIEW - SECTION 2

The Maine Department of Transportation uses two criteria to determine high crash locations (HCLs). The first is the critical rate factor (CRF), which is a measure of the accident rate. A CRF greater than one indicates a location which has a higher than expected accident rate. The expected rate is calculated as a statewide average of similar facilities.

The second criterion, which must also be met, is based upon the number of accidents that occur at a particular location. Eight or more accidents must occur over the three-year study period for the location to be considered a high crash location. Accident data was obtained from MaineDOT for Congress Street and Hutchins Drive within the expected study area. The CRF and number of accidents are summarized by location for the most recent three-year period, 2016 to 2018, below:

Location Description	# of Acc.	CRF
Congress Street between Johnson Road and cut to Johnson Road	1	0.47
Congress Street cut to Johnson Road and Unum Drive	3	0.29
Intersection of Congress Street and Unum Drive	4	0.21
Congress Street between Unum Dr. and Blueberry Road	5	0.33
Intersection of Congress Street and Blueberry Road	6	1.10
Congress Street between Blueberry Road and Hutchins/Skyway	8	0.62
Intersection of Congress Street, Hutchins Drive & Skyway Drive	23	0.73
Congress Street between Hutchins/Skyway and Westbrook Town Line	12	0.52
County Road between town line and Thomas Drive	8	0.66
Intersection of County Road & Thomas Drive in Westbrook	3	0.39
County Road between Thomas Drive and Finch Street	19	0.49
Intersection of County Road & Finch Street in Westbrook	4	0.60
Intersection of County Road & Spring Street in Westbrook	28	0.73
Hutchins Drive between Congress Street and its dead end	2	0.41
At end of Hutchins Drive	1	2.94

As can be seen in the above accident table, there are no high crash locations on either Route 22 (Congress Street/County Road) or Hutchins Drive in the vicinity of the site. Hence, no additional accident analysis should be required.

ENTRANCES AND EXITS - SECTION 3

Access to and from the proposed facility will be provided by a single full movement drive to Andover Road. The sight distances were measured by Ransom Consulting, Inc. and are shown on their site plan, along with the posted speed limits, included in this application package.

TITLE, RIGHT OR INTEREST - SECTION 4

The deed for the parcel is included in this application package.

0019509

BK 17401 PG 106

MAINE REAL ESTATE TAX PAID

WARRANTY DEED

(Maine Statutory Short Form)

KNOW ALL MEN BY THESE PRESENTS, That **GEORGE M. HUTCHINS**, of Falmouth, Maine for consideration paid, grants to **SPRING HARBOR HOSPITAL**, a Maine Business Corporation with a place of business at 465 Congress St., Portland, Maine, with **WARRANTY COVENANTS**, the land located in Portland and Westbrook, County of Cumberland, State of Maine , bounded and described as follows:

SEE EXHIBIT "A" ATTACHED HERETO
MADE A PART HEREOF AND INCORPORATED BY REFERENCE HEREIN

WITNESS my hand and seal this 8TH day of March, 2002

George M. Hutchins
GEORGE M. HUTCHINS

STATE OF MAINE
CUMBERLAND, ss.

March 8, 2002

Then personally appeared the above named George M. Hutchins and acknowledged the foregoing instrument to be his free act and deed.

Before me,

~~Notary Public~~
ATTORNEY

Printed Name: DANIEL J. DESMOND

EXHIBIT A

Three lots or parcels of land being located partially in the City of Portland and partially in the City of Westbrook, in the County of Cumberland, State of Maine, bounded and described as follows:

PARCEL 1

Being Lot 100 as shown on plan entitled, "Master Plan Standard Boundary Survey – Subdivision – Stroudwater Estates on Hutchins Drive & Harry Harmon Drive Portland, Maine made for George Hutchins", dated October 29, 1998 and updated to June 26, 2001 by Owen Haskell, Inc. to be recorded in the Cumberland County Registry of Deeds.

EXCEPTING a 35,279 square foot parcel as shown on the above mentioned plan as to be added to Lot 9.

PARCEL 2

Being Lot 200 as shown on plan entitled, "Master Plan Standard Boundary Survey – Subdivision – Stroudwater Estates on Hutchins Drive & Harry Harmon Drive Portland, Maine made for George Hutchins", dated October 29, 1998 and updated to June 26, 2001 by Owen Haskell, Inc. to be recorded in the Cumberland County Registry of Deeds.

PARCEL 3

Being Lot 34 as shown on plan entitled, "Master Plan Standard Boundary Survey – Subdivision – Stroudwater Estates on Hutchins Drive & Harry Harmon Drive Portland, Maine made for George Hutchins", dated October 29, 1998 and updated to June 26, 2001 by Owen Haskell, Inc. to be recorded in the Cumberland County Registry of Deeds.

EXCEPTING from Lot 34 such portion as was conveyed to the Portland Water District by deeds recorded in Book 2411, Page 133 and Book 2411, Page 136.

TOGETHER with another Lot or parcel of land adjacent to Lot 34 and being bounded and described as follows:

Beginning on the easterly side of Hutchins Drive at the northwesterly corner of land formerly of Robert Pazolt as described in the deed recorded in Book 7559, Page 210 of the Cumberland County Registry of Deeds;

Thence, North 86° 34' 35" East, along land formerly of Robert Pazolt, 270.00 feet to Lot 34 on the above mentioned plan;

Thence, North 12° 18' 20" West, along Lot 34 on the above mentioned plan, 297.56 feet;

Thence, North 72° 25' 25" West, along Lot 34 on the above mentioned plan, 240.00 feet to the easterly side of Hutchins Drive;

Thence, South 3° 25' 25" East, along the easterly side of Hutchins Drive, 380.00 feet to the point of beginning.

Containing 1.89 acres, more or less

Parcel 3 (Lot 34 and adjacent parcel of 1.89 acres) is subject to a "conservation easement" granted to the State of Maine Department of Inland Fisheries and Wildlife as described in deeds recorded in the Cumberland County Registry of Deeds in Book 11061, Page 285 and Book 11306, Page 220.

Parcel 3 as described above is a gift from George M. Hutchins to Spring Harbor Hospital.

PUBLIC OR PRIVATE RIGHTS-OF-WAY - SECTION 5

No new public or private right-of-ways are proposed for this project.

SCHEDULE - SECTION 6

Construction of the new medical center is expected to begin in April of 2020 with occupancy planned for July of 2021.

Utilities

History

Maureen McGlone PE of Ransom Environmental Consultants on August 2, 2019 applied for a wastewater capacity application form the City of Portland. She has additonally contacted Jon Giles, Bradley Roland and Keith Gray concerning both the water and sanitary sewer service to the site. It is my understating that ability to serve letters could not be prepared until the Site Plan application has actually been submitted. Once I receive letters from Public Works and the Portland Water District I will forward them to the Planning Staff.

PORTLAND FIRE DEPARTMENT
SITE REVIEW
FIRE DEPARTMENT CHECKLIST

for

The Center of Excellence in Autism and Developmental Disorders

A separate drawing[s] shall be provided as part of the site plan application for the Portland Fire Department's review. Please refer to the following drawings included with this checklist

1. Name, address, telephone number of applicant (Cover Sheet)
2.
3. Name address, telephone number of architect (Cover Sheet)

4. Proposed uses of any structures [NFPA and IBC classification] (A-001)
5.
6. Square footage of all structures [total and per story] (A-001)

7. Elevation of all structures (A-200, A-201)

8. Proposed fire protection of all structures
   - ***As of September 16, 2010 all new construction of one and two family homes are required to be sprinkled in compliance with NFPA 13D. This is required by City Code. (NFPA 101 2009 ed.)***

9. Hydrant locations (C-100, C-101)

10. Water main[s] size and location (C-103)

11. Access to all structures [min. 2 sides] (C-101)

12. A code summary shall be included referencing NFPA 1 and all fire department. Technical standards. (A-001)

Some structures may require Fire flows using annex H of NFPA 1

Invue

DESCRIPTION

The EPIC Collection delivers custom luminaire flexibility with high quality, yet availability expectations of standard specification grade product. The EPIC Collection can be dressed to suit any application. Recognizing evolving environmental and legislative trends, the EPIC Collection delivers world class LED optical and performance solutions to the decorative luminaire marketplace.

Catalog #		Type

SPECIFICATION FEATURES

Construction

TOP: Cast aluminum top housing attaches to cast aluminum mounting arm hub with four stainless steel fasteners. One-piece silicone gasket between mounting hub and top casting seals out moisture and contaminants. (See the mounting accessories section for a full selection of mounting arms. (Only these arms are compatible with the Epic luminaire). MIDSECTION: Continuous silicone gaskets seal lens to top casting and shade. The mid section features cast aluminum construction and stainless steel assembly. SHADES: Heavy gauge precision spun aluminum shades offer superior surface finish and consistency in form. DOORFRAME: Die-cast aluminum 1/8" thick door and doorframe seal to underside of shade with a thick wall continuous silicone gasket. Mounting hub ships attached to mounting arm.

Optics

Choice of twelve patented, high-efficiency AccuLED Optic™ technology manufactured from injection-molded acrylic. Optics are precisely designed to shape the optics, maximizing efficiency and application spacing. AccuLED Optic technology, creates consistent distributions with the scalability to meet customized application requirements. Offered Standard in 4000K (+/- 275K) CCT and nominal 70 CRI. Optional 3000K CCT and 5000K CC. For the ultimate level of spill light control, an optional house-side shield accessory can be field or factory installed. The house-side shield is designed to seamlessly integrate with the SL2, SL3 or SL4 optics.

Electrical

LED drivers mount to die-cast aluminum back housing for optimal heat sinking, operation efficacy, and prolonged life. Standard drivers feature electronic universal voltage (120-277V 50/60Hz), 347V 60Hz or 480V 60Hz operation, greater than 0.9 power factor, less that 20% harmonic distortion, and is suitable for operation in -40°C to 40°C ambient environments. All fixtures are shipped standard with 10kV/10kA common – and differential – mode surge protection. LightBARs feature and IP66 enclosure rating and maintain greater than 95% lumen maintenance at 60,000 hours per IESNA TM-21. Occupancy sensor and dimming options available.

Finish

Housing is finished in five-stage super TGIC polyester powder coat paint, 2.5 mil nominal thickness for superior protection against fade and wear. LightBAR™ cover plates are standard white and may be specified to match finish of luminaire housing. Standard colors include black, bronze, grey, white, dark platinum and graphite metallic. RAL and custom color matches available. Consult Outdoor Architectural Colors brochure for a complete selection.

Warranty

Five-year warranty.

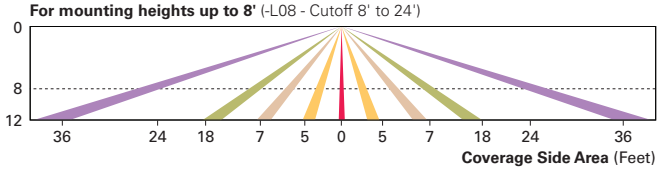
Specifications and dimensions subject to change without notice.

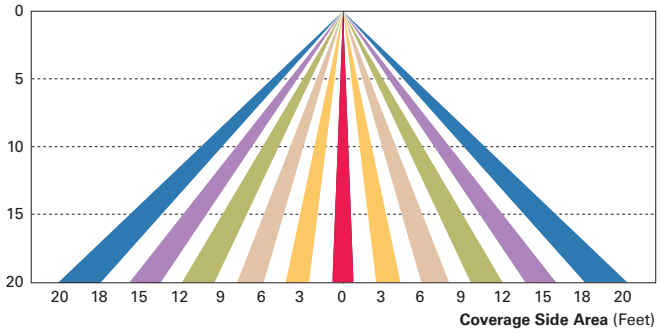
CONTROL OPTIONS

0-10V (DIM)
This fixture is offered standard with 0-10V dimming driver(s). The DIM option provides 0-10V dimming wire leads for use with a lighting control panel or other control method.



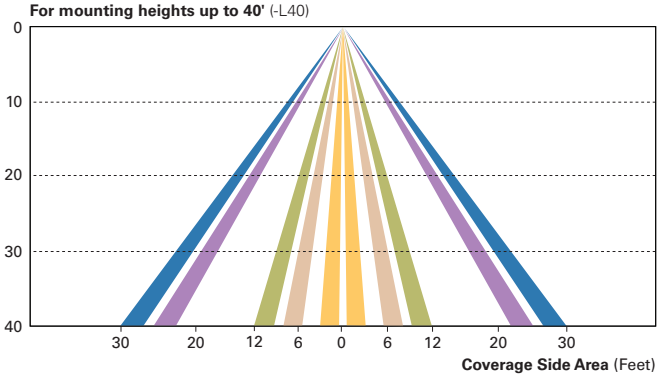
Photocontrol (PC, PER and PER7)
Optional button-type photocontrol (PC) and photocontrol receptacles (PER and PER7) provide a flexible solution to enable "dusk-to-dawn" lighting by sensing light levels. Advanced control systems compatible with NEMA 7-pin standards can be utilized with the PER7 receptacle.

Dimming Occupancy Sensor (MS/DIM-LXX, MS/X-LXX and MS-LXX)
These sensors are factory installed in the luminaire housing. When the MS/DIM-LXX sensor option is selected, the occupancy sensor is connected to a dimming driver and the entire luminaire dims when there is no activity detected. When activity is detected, the luminaire returns to full light output. The MS/DIM sensor is factory preset to dim down to approximately 50 percent power with a time delay of five minutes. The MS-LXX sensor is factory preset to turn the luminaire off after five minutes of no activity. The MS/X-LXX is also preset for five minutes and only controls the specified number of light engines to maintain steady output from the remaining light engines.

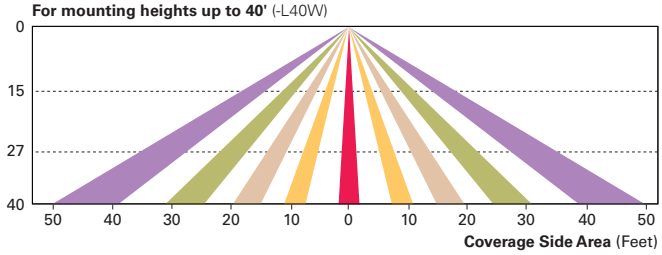


These occupancy sensors includes an integral photocell that can be activated with the FSIR-100 accessory for "dusk-to-dawn" control or daylight harvesting - the factory preset is OFF. The FSIR-100 is a wireless tool utilized for changing the dimming level, time delay, sensitivity and other parameters.

A variety of sensor lens are available to optimize the coverage pattern for mounting heights from 8'-40'.

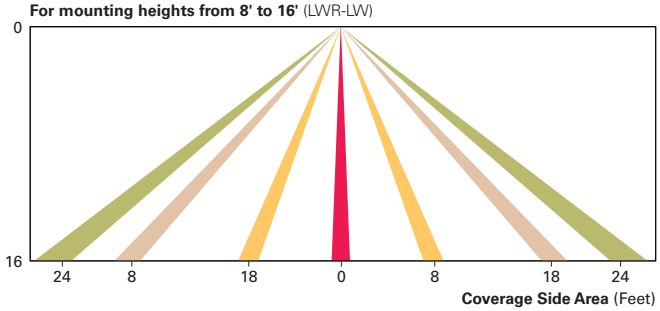


For mounting heights up to 8' (-L08 - Cutoff 8' to 24')

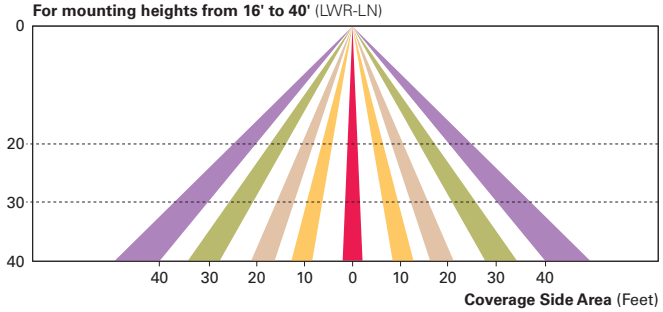


For mounting heights up to 20' (-L20)

For mounting heights up to 40' (-L40)



For mounting heights up to 40' (-L40W)



LumaWatt Pro Wireless Control and Monitoring System (LWR-LW and LWR-LN)
The LumaWatt Pro system is a peer-to-peer wireless network of luminaire-integral sensors for any sized project. Each sensor is capable of motion and photo sensing, metering power consumption and wireless communication. The end-user can securely create and manage sensor profiles with browser-based management software. The software will automatically broadcast to the sensors via wireless gateways for zone-based and individual luminaire control. The LumaWatt Pro software provides smart building solutions by utilizing the sensor to provide easy-to-use dashboard and analytic capabilities such as improved energy savings, traffic flow analysis, building management software integration and more.

For additional details, refer to the LumaWatt Pro product guides.

For mounting heights from 8' to 16' (LWR-LW)

For mounting heights from 16' to 40' (LWR-LN)

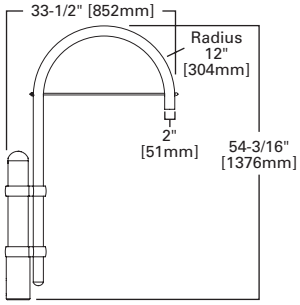
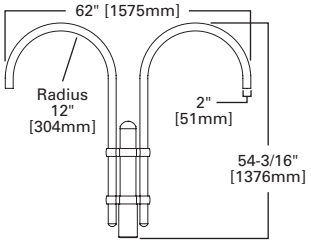
V=Victorian Finial [18]
M=Modern Finial [18]
A=Architectural Finial [18]
N=Nostalgic Finial [18]
R=NEMA Twistlock Photocontrol Receptacle [19]

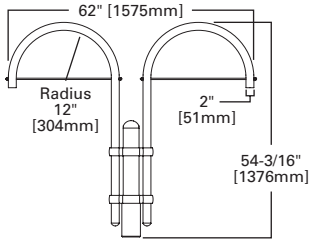


NOTES:
1. Arm not included. Order separately. See accessories.
2. Standard 4000K CCT and greater than 70 RI.
3. 21 LED LightBAR powered by 350mA and 7 LED LightBAR powered by 1A.
4. Only for use with 480V Wye systems. Per NEC, not for use with ungrounded systems, impedance grounded systems or corner grounded systems (commonly known as Three Phase Three Wire Delta, Three Phase High Leg Delta and Three Phase Corner Grounded Delta systems).
5. Custom and RAL color matching available upon request. Consult your lighting representative at Eaton for more information.
6. Low-level output varies by bar count. Consult factory. Requires quantity of two or more LightBARs.
7. Consult customer service for lead times and multiplier.
8. Sensor mounted to the luminaire. Available in E01-E04 and F01-F04 configurations. Replace "XX" with mounting height in feet for proper lens selection, (e.g., MS-L25). Consult factory for additional information.
9. Sensor mounted to the luminaire. Available in E02-E04 and F02-F04 configurations. Replace "X" with number of LightBARs operating in low output mode and replace XX with mounting height in feet for proper lens selection, (e.g., MS/3-L25). Maximum four bars in low output mode. Consult factory for additional information.
10. Pendant mount option "PMXX" must be used with Invue Pendant mount kit only. Includes pendant pipe, swivel hangar and canopy cover. Other pendant lengths can be specified in inches (XX). Minimum pendant length is 9-1/2". For lengths above 48", consult your lighting representative at Eaton for more information.
11. Only for use with SL2, SL3 and SL4 distributions.
12. Dimming leads provide for external 0-10V control system (by others).
13. LumaWatt wireless sensors are factory installed only, requiring network components LWP-EM-1, LWP-GW-1, and LWP-PoE8 in appropriate quantities. See www.eaton.com/lighting for LumaWatt application information.
14. Replace XX with color suffix.
15. Only available with traditional arms.
16. One required for each LightBAR.
17. Add as suffix to accessory. Example: VA6109-BK-R.
18. Not available with finials, pendant mount "PM48" or bishop wall mounts.
19. Requires use of 4" O.D. round straight pole.

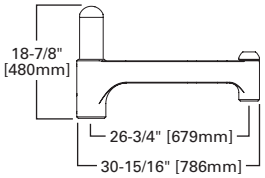
MOUNTING ACCESSORIES



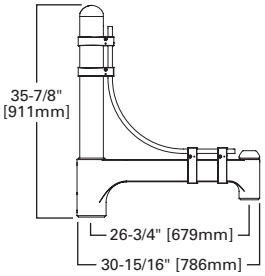
Pole mount arms are designed to fit both medium ECM/EMM housings. (Only these arms are compatible with the Epic luminaire). Arms feature a precision welded cast aluminum mounting hub for attachment of fixture head to arm with four stainless steel fasteners. Wall mount arms are designed to fit both medium ECM/EMM housings. Arms feature a precision welded cast aluminum mounting hub for attachment of fixture head to arm with four stainless steel fasteners.



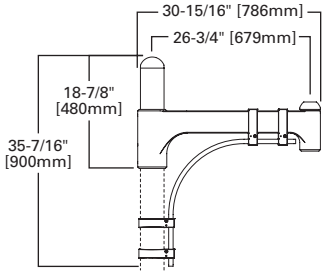
BISHOP SINGLE POLE MOUNT ARM
VA6105 (Modern), VA6154 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 24 lbs. E.P.A: 0.92



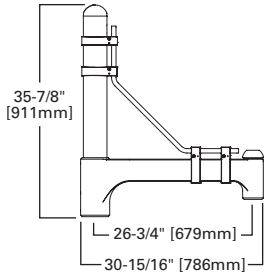
BISHOP SINGLE POLE MOUNT ARM WITH CROSS ROD
VA6106 (Modern), VA6155 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 25 lbs. E.P.A: 0.98



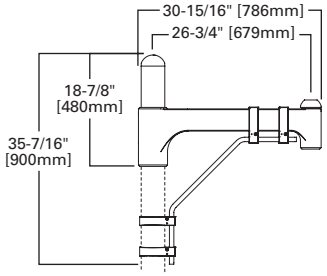
BISHOP TWIN POLE MOUNT ARM
VA6107 (Modern), VA6156 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 37 lbs. E.P.A: 1.43



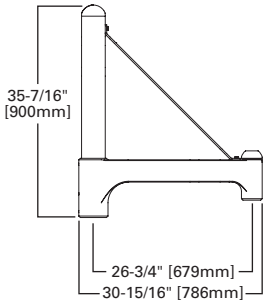
BISHOP TWIN POLE MOUNT ARM WITH CROSS RODS
VA6108 (Modern), VA6157 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 39 lbs. E.P.A: 1.55



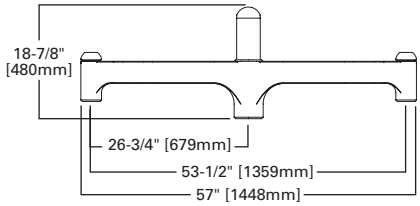
TRADITIONAL SINGLE POLE MOUNT ARM
VA6109 (Modern), VA6158 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 20 lbs. E.P.A: 0.86



TRADITIONAL SINGLE POLE MOUNT ARM WITH ROUNDED UPPER BAR
VA6110 (Modern), VA6159 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 28 lbs. E.P.A: 1.4

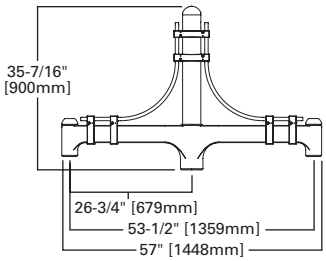


TRADITIONAL SINGLE POLE MOUNT ARM WITH ROUNDED LOWER BAR
VA6111 (Modern), VA6160 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 25 lbs. E.P.A: 1.16

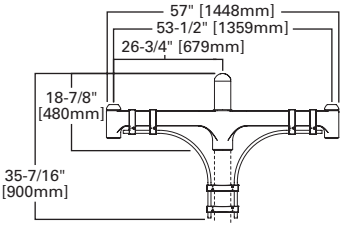


TRADITIONAL SINGLE POLE MOUNT ARM WITH 45° UPPER BAR
VA6112 (Modern), VA6161 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 28 lbs. E.P.A: 1.38

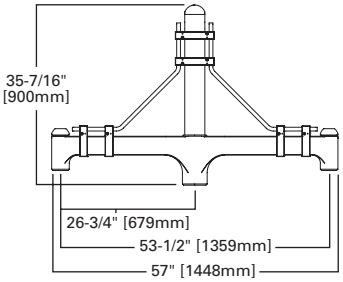
TRADITIONAL SINGLE POLE MOUNT ARM WITH 45° LOWER BAR
VA6113 (Modern), VA6162 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 24 lbs. E.P.A: 1.17



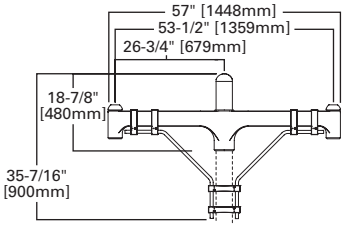
TRADITIONAL SINGLE POLE MOUNT ARM WITH 45° UPPER STRAP
VA6114 (Modern), VA6163 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 24 lbs. E.P.A: 1.17



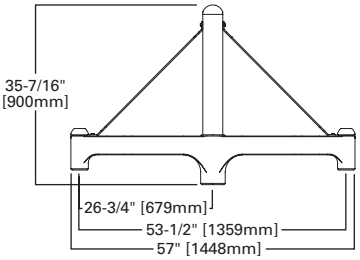
TRADITIONAL TWIN POLE MOUNT ARM
VA6116 (Modern), VA6165 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 30 lbs. E.P.A: 1.44



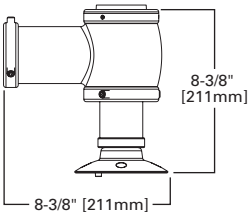
MOUNTING ACCESSORIES



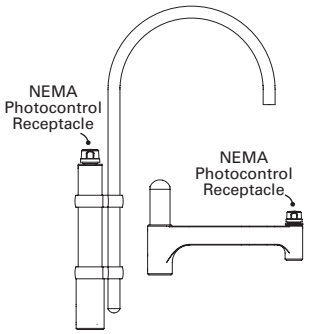
TRADITIONAL TWIN POLE MOUNT ARM WITH ROUNDED UPPER BARS
VA6117 (Modern), VA6166 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 43 lbs. E.P.A: 2.28



TRADITIONAL TWIN POLE MOUNT ARM WITH ROUNDED LOWER BARS
VA6118 (Modern), VA6167 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 40 lbs. E.P.A: 2.04

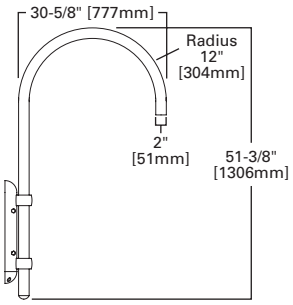


TRADITIONAL TWIN POLE MOUNT ARM WITH 45° UPPER BARS
VA6119 (Modern), VA6168 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 43 lbs. E.P.A: 2.24

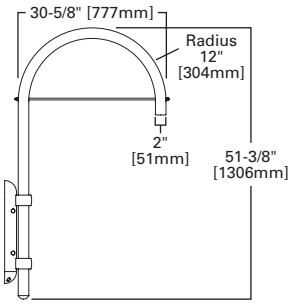


TRADITIONAL TWIN POLE MOUNT ARM WITH 45° LOWER BARS
VA6120 (Modern), VA6169 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 40 lbs. E.P.A: 2.0

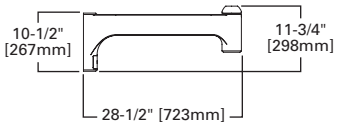
TRADITIONAL TWIN POLE MOUNT ARM WITH 45° UPPER STRAPS
VA6121 (Modern), VA6170 (Classical)
Slipfits over 4" round straight pole, or 4" O.D. by 6" tall tenon.
Weight: 37 lbs. E.P.A: 1.81



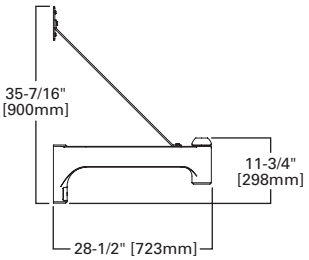
MAST ARM ADAPTER
VA6122 (Modern), VA6171 (Classical)
Secures fixture to nominal 2" pipe (2-3/8" horizontal O.D.)
Weight: 4 lbs.



NEMA TWISTLOCK PHOTOCONTROL (R)
Order separately (Not compatible with finials or wall mount bishop arms)



Wall Mount Accessories



BISHOP WALL MOUNT ARM
VA6101 (Modern), VA6150 (Classical)
Mounts to wall with four stainless steel lag bolts (provided by other).
Weight: 16 lbs.

BISHOP WALL MOUNT ARM WITH CROSS ROD
VA6102 (Modern), VA6151 (Classical)
Mounts to wall with four stainless steel lag bolts (provided by other).
Weight: 17 lbs.

TRADITIONAL WALL MOUNT ARM
VA6103 (Modern), VA6152 (Classical)
Mounts to wall with four stainless steel lag bolts (provided by other).
Weight: 17 lbs.

TRADITIONAL WALL MOUNT ARM WITH 45° STRAP
VA6104 (Modern), VA6153 (Classical)
Mounts to wall with four stainless steel lag bolts (provided by other).
Weight: 18 lbs.

Streetworks

DESCRIPTION

The Galleon™ LED luminaire delivers exceptional performance in a highly scalable, low-profile design. Patented, high-efficiency AccuLED Optics™ system provides uniform and energy conscious illumination to walkways, parking lots, roadways, building areas and security lighting applications. IP66 rated and UL/cUL Listed for wet locations.

Catalog #		**Type** SL
Project		
Comments		**Date**
Prepared by		

SPECIFICATION FEATURES

Construction
Extruded aluminum driver enclosure thermally isolated from Light Squares for optimal thermal performance. Heavy-wall, die-cast aluminum end caps enclose housing and die-cast aluminum heat sinks. A unique, patent pending interlocking housing and heat sink provides scalability with superior structural rigidity. 3G vibration tested and rated. Optional tool-less hardware available for ease of entry into electrical chamber. Housing is IP66 rated.

Optics
Patented, high-efficiency injection-molded AccuLED Optics technology. Optics are precisely designed to shape the distribution maximizing efficiency and application spacing. AccuLED Optics create consistent distributions with the scalability to meet customized application requirements. Offered standard in 4000K (+/- 275K) CCT 70 CRI. Optional 3000K, 5000K and 6000K CCT.

Electrical
LED drivers are mounted to removable tray assembly for ease of maintenance. 120-277V 50/60Hz, 347V 60Hz or 480V 60Hz operation. 480V is compatible for use with 480V Wye systems only. Standard with 0-10V dimming. Shipped standard with Eaton proprietary circuit module designed to withstand 10kV of transient line surge. The Galleon LED luminaire is suitable for operation in -40°C to 40°C ambient environments. For applications with ambient temperatures exceeding 40°C, specify the HA (High Ambient) option. Light Squares are IP66 rated. Greater than 90% lumen maintenance expected at 60,000 hours. Available in standard 1A drive current and optional 600mA, 800mA and 1200mA drive currents (nominal).

Mounting
STANDARD ARM MOUNT: Extruded aluminum arm includes internal bolt guides allowing for easy positioning of fixture during mounting. When mounting two or more luminaires at 90° and 120° apart, the EA extended arm may be required. Refer to the arm mounting requirement table. Round pole adapter included. For wall mounting, specify wall mount bracket option. QUICK MOUNT ARM: Adapter is bolted directly to the pole. Quick mount arm slide into place on the adapter and is secured via two screws, facilitating quick and easy installation. The versatile, patent pending, quick mount arm accommodates multiple drill patterns ranging from 1-1/2" to 4-7/8". Removal of the door on the quick mount arm enables wiring of the fixture without having to access the driver compartment. A knock-out enables round pole mounting.

Finish
Housing finished in super durable TGIC polyester powder coat paint, 2.5 mil nominal thickness for superior protection against fade and wear. Heat sink is powder coated black. Standard housing colors include black, bronze, grey, white, dark platinum and graphite metallic. RAL and custom color matches available.

Warranty
Standard five-year warranty. Optional ten-year warranty, please see your Eaton Streetworks sales representative for more information.

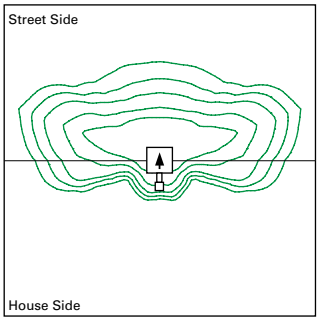
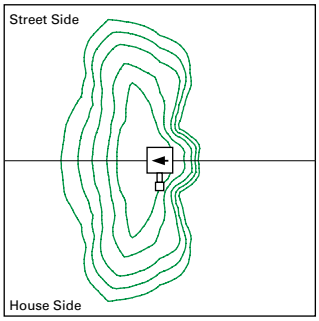
QMEA Quick Mount Arm (Extended)

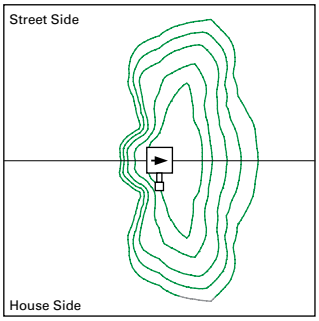


QUICK MOUNT ARM DATA



Number of Light Squares [1, 2]	**"A" Width**	**Weight with QM Arm** (lbs.)	**Weight with QMEA Arm** (lbs.)	**EPA** (Sq. Ft.)
1-4	15-1/2" (394mm)	35 (15.91 kgs.)	38 (17.27 kgs.)	1.11
5-6 [3]	21-5/8" (549mm)	46 (20.91 kgs.)	49 (22.27 kgs.)	
7-8	27-5/8" (702mm)	56 (25.45 kgs.)	59 (26.82 kgs.)	

NOTES: 1 QM option available with 1-8 light square configurations. **2** QMEA option available with 1-6 light square configurations. **3** QMEA arm to be used when mounting two fixtures at 90° on a single pole.



OPTIC ORIENTATION

Standard

Optics Rotated Left @ 90° [L90]

* Nominal data for 70 CRI.

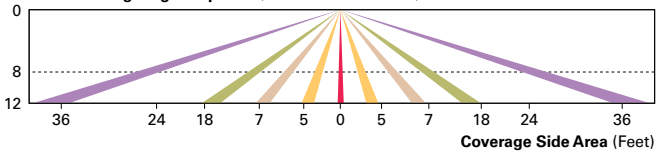
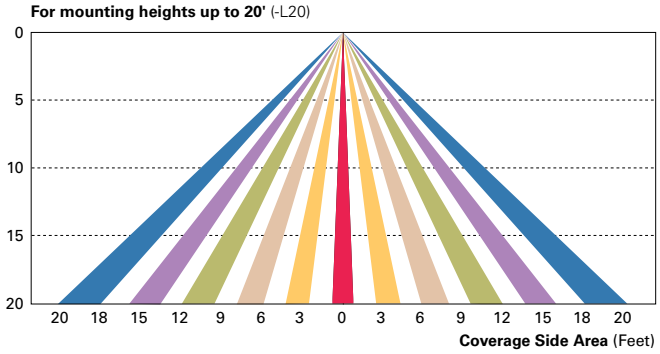
CONTROL OPTIONS

0-10V (DIM)
This fixture is offered standard with 0-10V dimming driver(s). The DIM option provides 0-10V dimming wire leads for use with a lighting control panel or other control method.



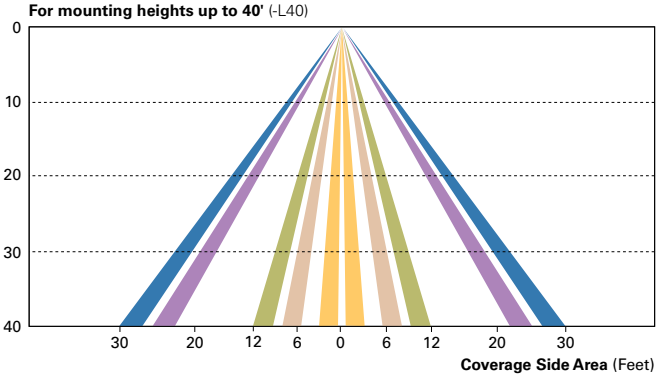
Photocontrol (P, 4 and 4N7)
Optional button-type photocontrol (P) and photocontrol receptacles (4 and 4N7) provide a flexible solution to enable "dusk-to-dawn" lighting by sensing light levels. Advanced control systems compatible with NEMA 7-pin standards can be utilized with the 4N7 receptacle.

After Hours Dim (AHD)
This feature allows photocontrol-enabled luminaires to achieve additional energy savings by dimming during scheduled portions of the night. The dimming profile will automatically take effect after a "dusk-to-dawn" period has been calculated from the photocontrol input. Specify the desired dimming profile for a simple, factory-shipped dimming solution requiring no external control wiring. Reference the After Hours Dim supplemental guide for additional information.

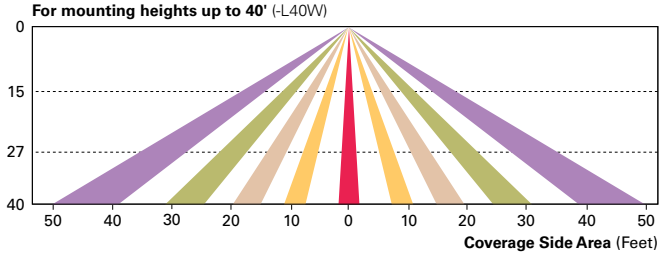


Dimming Occupancy Sensor (MS/DIM-LXX, MS/X-LXX and MS-LXX)
These sensors are factory installed in the luminaire housing. When the MS/DIM-LXX sensor option is selected, the occupancy sensor is connected to a dimming driver and the entire luminaire dims when there is no activity detected. When activity is detected, the luminaire returns to full light output. The MS/DIM sensor is factory preset to dim down to approximately 50 percent power with a time delay of five minutes. The MS-LXX sensor is factory preset to turn the luminaire off after five minutes of no activity. The MS/X-LXX is also preset for five minutes and only controls the specified number of light engines to maintain steady output from the remaining light engines.

These occupancy sensors includes an integral photocell that can be activated with the FSIR-100 accessory for "dusk-to-dawn" control or daylight harvesting - the factory preset is OFF. The FSIR-100 is a wireless tool utilized for changing the dimming level, time delay, sensitivity and other parameters. A variety of sensor lens are available to optimize the coverage pattern for mounting heights from 8'-40'.

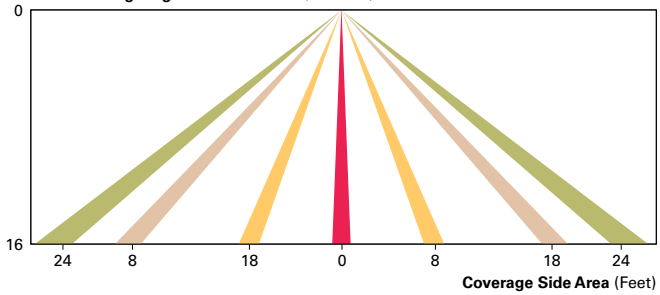


For mounting heights up to 8' (-L08 - Cutoff 8' to 24')

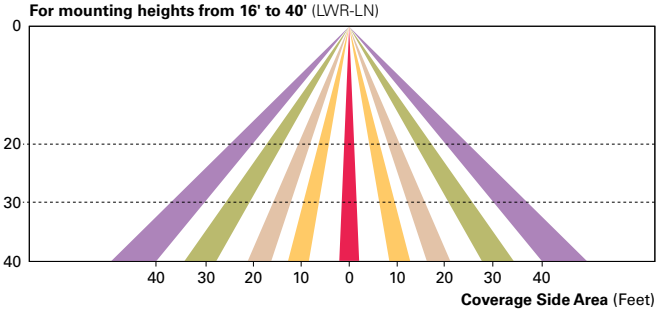


For mounting heights up to 20' (-L20)

For mounting heights up to 40' (-L40)



For mounting heights up to 40' (-L40W)



LumaWatt Pro Wireless Control and Monitoring System (LWR-LW and LWR-LN)
The LumaWatt Pro system is a peer-to-peer wireless network of luminaire-integral sensors for any sized project. Each sensor is capable of motion and photo sensing, metering power consumption and wireless communication. The end-user can securely create and manage sensor profiles with browser-based management software. The software will automatically broadcast to the sensors via wireless gateways for zone-based and individual luminaire control. The LumaWatt Pro software provides smart building solutions by utilizing the sensor to provide easy-to-use dashboard and analytic capabilities such as improved energy savings, traffic flow analysis, building management software integration and more. For additional details, refer to the LumaWatt product guides.

For mounting heights from 8' to 16' (LWR-LW)

For mounting heights from 16' to 40' (LWR-LN)

LumenSafe Integrated Network Security Camera (LD)
Eaton brings ease of camera deployment to a whole new level. No additional wiring is needed beyond providing line power to the luminaire. A variety of networking options allows security integrators to design the optimal solution for active surveillance. As the ideal solution to meet the needs for active surveillance, the LumenSafe integrated network camera is a streamlined, outdoor-ready fixed dome that provides HDTV 1080p video. This IP camera is optimally designed for deployment in the video management system or security software platform of choice.

GLEON-QM=Quick Mount Arm Kit [11]
GLEON-QMEA=Quick Mount Extended Length Arm Kit [12]
LS/HSS=Field Installed House Side Shield [25, 26]

NOTES:
1. Customer is responsible for engineering analysis to confirm pole and fixture compatibility for all applications. Refer to our white paper WP513001EN for additional support information.
2. DesignLights Consortium® Qualified. Refer to www.designlights.org Qualified Products List under Family Models for details.
3. Standard 4000K CCT and minimum 70 CRI.
4. Not compatible with MS/4-LXX or MS/1-LXX sensors.
5. Not compatible with extended quick mount arm (QMEA).
6. Not compatible with standard quick mount arm (QM) or extended quick mount arm (QMEA).
7. Requires the use of a step down transformer when combined with sesnor options. Not available with sensor at 1200mA. Not available in combination with the HA high ambient and sensor options at 1A.
8. Only for use with 480V Wye systems. Per NEC, not for use with ungrounded systems, impedance grounded systems or corner grounded systems (commonly known as Three Phase Three Wire Delta, Three Phase High Leg Delta and Three Phase Corner Grounded Delta systems).
9. May be required when two or more luminaires are oriented on a 90° or 120° drilling pattern. Refer to arm mounting requirement table.
10. Factory installed.
11. Maximum 8 light squares.
12. Maximum 6 light squares.
13. Use dedicated IES files for 2700K, 3000K, 5000K, 6000K when performing layouts. These files are published on the Galleon luminaire product page on the website.
14. 1 Amp standard. Use dedicated IES files for 600mA, 800mA and 1200mA when performing layouts. These files are published on the Galleon luminaire product page on the website.
15. Not available with HA option.
16. 2L is not available with MS/X or MS/DIM at 347V or 480V. 2L in AF-02 through AF-04 requires a larger housing, normally used for AF-05 or AF-06.
17. Not available with LumaWatt Pro wireless sensors.
18. Requires the use of P photocontrol or the 4N7 or 4 photocontrol receptacle with photocontrol accessory. See After Hours Dim supplemental guide for additional information.
19. The FSIR-100 accessory is required to adjust parameters.
20. Available in 2, 3, 4 or 6 Light Square configurations. Replace "X" with number of Light Squares in low output mode. Not available with dimming leads. No terminal block with bi-level operation.
21. LumaWatt Pro wireless sensors are factory installed only requiring network components LWP-EM-1, LWP-GW-1, and LWP-PoE8 in appropriate quantities. See www.eaton.com/lighting for LumaWatt Pro application information.
22. Not available with house side shield (HSS).
23. Only for use with SL2, SL3, SL4 and AFL distributions. The Light Square trim plate is painted black when the HSS option is selected.
24. CE is not available with the LWR, MS, MS/X, MS/DIM, P, 4 or 4N7 options. Available in 120-277V only.
25. This tool enables adjustment of parameters including high and low modes, sensitivity, time delay, cutoff and more. Consult your lighting representative at Eaton for more information.
26. One required for each Light Square.

Aluminum Poles

SSA SQUARE STRAIGHT ALUMINUM

Catalog #		**Type** SL
Project		
Comments		**Date**
Prepared by		

FEATURES
- Straight square shaft 6005-T6 aluminum alloy polished
- 356-T6 cast aluminum alloy base with aluminum knock-in bolt covers
- 8'-35' mounting heights
- Drilled or tenon (specify)

DESIGN CONSIDERATIONS

Wind induced vibrations resulting from steady, unidirectional winds and other aerodynamic forces, as well as vibration and coefficient of height factors for non-grounded mounted installations (e.g., installations on bridges or buildings) are not included in this document. The information contained herein is for general guidance only and is not a replacement for professional judgement. Consult with a professional, and local and federal standards, before ordering to ensure product is appropriate for the intended purpose and installation location. Also, please review Eaton's Light Pole White Paper for risk factors and design considerations. Learn more.

Specifications and dimensions subject to change without notice. Consult your lighting representative at Eaton or visit www.eaton.com/lighting for available options, accessories and ordering information.

NOTES:

1. Catalog number includes pole with hardware kit. Anchor bolts not included. Before installing, make sure proper anchor bolts and templates are obtained.

2. Tenon size or machining for rectangular arms must be specified. Hand hole position relative to drill location.

3. Shaft size, base square, anchor bolts and projections may vary slightly. All dimensions nominal.

4. EPAs based on shaft properties with wind normal to flat. EPAs calculated using base wind velocity as indicated plus 30% gust factor.

5. Factory installed vibration damper.

ECO NU6" Round Adjustable

COB

LUTRON OEM ADVANTAGE ACCOUNT

eldoLED your product | our drive

SS

DESCRIPTION

The EcoNU6RA is an economical and highly efficient spec grade 6" recessed adjustable with thoughtful construction and pleasing aesthetics. Standard with premium dimming using EldoLED 1% flicker free drivers in 120V, 277V, and step down transformer for 347V. A minimalistic look is achieved with an ultrathin 1/16" trim that is only 5/16" wide. Color choices of both trim and bezel are offered for a customized look. An adjustable hot-aiming system allows tilt adjustments from 0° to 40° with 360° rotation. The aiming adjustment and locking mechanisms are accessible from below the ceiling while the reflector is installed. A complex tilting mechanism positions the tilting axis for the maximum optical performance at all angles.

HOUSING

Electrocoated 16-gauge cold-rolled steel provides enhanced structural reinforcement and rust prevention. Superior, flame-retardant, UL-certified, injection-molded commercial-grade Lexan™ (PC) is used for the frame and regressed bezel trim. Lexan provides unmatched durability and impact resistance, 270°F heat deflection temperature, and is tested for UV resistance and water exposure in outdoor applications. The thermally-advanced, anodized heat sink uses 6063 aluminum alloy. A 90-minute constant-power IOTA emergency battery backup is available.

MOUNTING

An advanced mounting system allows for quick and secure installation with LED and driver serviceability from below the ceiling. The LED assembly uses die-cast aluminum mounting clamp grips (MCG) that swing out to tighten onto variable ceiling thicknesses ranging from 1/8" to 1-5/8". Integrated rubber feet on each MCG provide a non-slip vibration-resistant installation. The hidden MCG system is accessible from below ceiling by removing the snap-in lens/bezel assembly with either the included suction cup or a screwdriver blade. Integrated bar hangers feature integral toothed nails, T-bar mounting slots with locking holes, tabs for joist positioning, and extendibility from 14-3/4" to 26". Retrofit mounting option allows for installation from below ceiling by use of compact driver box. Ceiling cutout size is 6-3/8" diameter.

LISTINGS

- ETLus Listed to UL1598, cETL Listed to CSA C22.2 #250.0
- Type Non-IC, IC, CP, Airtight ASTM Standard E283
- Suitable for damp locations without lens
- Non-conductive, Lexan dead-front construction
- Made in the USA – meets the requirements of the Buy American provision within the ARRA

LED INFO

- 90 CRI: SDCM = 2-step MacAdam Ellipse, Lumen Maintenance: L_{70} > 38,500 hrs
- 80 CRI: SDCM = 3-step MacAdam Ellipse, Lumen Maintenance: L_{70} > 38,500 hrs

ORDERING CODE

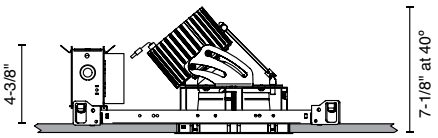
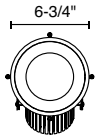
Follow the steps to specify your fixture, example:
NU6 - RA - SW - 30LM - 35K - 90 - D50 - 120 - DIM10 - NC - WH - WH - EM7

SW (LED)	POWER
DELIVERED LM	W (80CRI)
630	7
830	8
1025	11
1635	16
2465	26
3320	32

Power Factor ≥ 0.9



NOTES



1. 90 CRI not available in 5000K.
2. IC/ICAT/CP not available in 40LM.
3. Driver uses logarithmic dimming curve as standard. For linear dimming curve add “LIN” after dimming code, i.e. DIM10LIN.
4. Triac/ELV dimming available in 120V only.
5. For integrated test switch add “ITS” after emergency backup code, i.e. EM12ITS. Test switch is mounted in the bezel of the fixture.
6. LUTP not available in 30LM or 40LM.

In a continuing effort to offer the best product possible we reserve the right to change, without notice, specifications or materials that in our opinion will not alter the function of the product.

Notes:

Gardco 101 LED wall sconces feature a low-profile design that provides wide flexibility in high performance exterior wall illumination. Full cutoff performance, usable illumination patterns, and powerful wattages combine into a compact and architecturally pleasing design. 101L sconces are available in Type 2, 3, and 4 distributions, and provide output of up to 9500 lumens. Energy saving control options increase energy savings and offer California Title 24 compliance. Emergency Battery Backup option available for path of egress.

1. 650mA only available with Emergency Battery Pack Cold Rated (EBPC) option
2. 32L rated for 30°C at 1000mA
3. Available for use with 16L and 32L in 530mA or 650mA only. Rated for -20°C to 35° C.
4. Available in 120 or 277V only.
5. Not available with Dual Circuit Control (DCC) option.
6. EBPC is not available with DCC.
7. Not available with Dimming Driver (DD) option.
8. Available in 32L with 530mA. Consult technical support center for use with photocell and CS/CM/CE/DA.
9. Available in 120-277V (UNV) only.
10. Not available with LLC, TLR and DCC.
11. Not available with 480V.
12. Must specify input voltage.
13. TLRD5/7 option not available with LLC, PCB, DCC. Works with 3 or 5 pin NEMA photocell dimming. Dimming will not be connected to TLR if ordering with DD, CS/CM/CE/DA and IMRI.
14. Not available with DD, DCC or LLC.
15. LLC2/3 Not available with TLR, PCB, IMRI, CS/CM/CE/DA. Ships with WS accessory attached to wireless module. Not for use with LLCR accessory.
16. Not available with PCB, TLRD5/7, DCC, LLC.
17. SW option is not available with any other control options with the exception of IMRI2, IMRI3 motion response options.

Wireless system remote controller accessory

Wireless system offers a remote radio/sensor module that allows to connected to a Limelight system (sold by other). Remote module can be mounted to wall or pole with j-box supplied. May be specified by choosing one of two different lenses to accommodate a variety of mounting heights/sensor detection ranges. Must specify option DD on luminaires that are planned to be used with remote mount controllers. See page 4 for Wireless system details.

LED Wattage and Lumen Values (Emergency Mode)[3]

Ordering Code	LED Qty	LED Current (mA)	Color Temp.	Ave. System Watts (charging mode)	Type 2	Type 3	Type 4
101L-16L-NW-EBPC	16	N/A	4000K	14	1345	1228	1255
101L-32L-NW-EBPC	32	N/A	4000K	14	1754	1600	1636

1. Wattage and lumen output may vary by +/- 8% due to LED manufacturer forward volt specification and ambient temperature. Wattage shown is average for 120V through 277V input. Actual wattage may vary by an additional +/- 10% due to actual input voltage.
2. Lumen values based on photometric tests performed in compliance with IESNA LM-79.
3. For emergency EBPC option, publish values are based on initial lumens.

Luminaire options

DD: 0-10V dimming driver with leads supplied through back of luminaire (for secondary dimming controls by others).

Dynadimmer Automatic Profile Dimming: Automatic dimming profiles (CS50/CM50/CE50) offer safety, median, or economy settings, for shorter or longer duration. Dimming profiles provide flexibility towards energy savings goals while optimizing light levels during specific dark hours. 50% dimming is standard. DA50 offers 50% instantaneous dimming all night (during all dark hours). Other dimming settings are also available if different light levels are required (contact Technical Support for details).

Profile	Dimming		
	Schedule	Duration	Level
Economy	9 PM - 6 AM	9 hours	50%
Median	10 PM - 6 AM	8 hours	50%
Safety	11 PM - 6 AM	7 hours	50%
Reactive 50	all night	dynamic	50%

TLRD5: Twist Lock Receptacle with 5 pins enabling dimming, can be used with a twistlock photoelectric cell or a shorting cap. Can also be used with third party control system.

TLRD7: Twist Lock Receptacle with 7 pins enabling dimming and additional functionality, can be used with twistlock photoelectric cell or a shorting cap. Can also be used with third party control system.

TLRDPC: Receptacle with twistlock photoelectric cell (must specify voltage). Receptacle located on top of luminaire housing.

IMRI2, IMRI3: Infrared Motion Response Integral (IMRI). IMRI module is mounted integral to the luminaire door and is available with two different sensor lens types to accommodate various mounting heights and occupancy detection ranges (see charts for approximate detection patterns). Motion response used in combination of Dynadimmer and SiteWise are not programmable and used to override controllers schedule when motion is detected. When used not combined with any controller, IMRI is set/operates in the following fashion: The motion sensor is set to a constant 50%. When motion is detected by the PIR sensor, the luminaire returns to 100% light output. Dimming on low is factory set to 50% with 5 minute default in "full power" prior to dimming back to low. When no motion is detected for 5 minutes, the motion response system reduces the wattage by 50% of the normal constant wattage reducing the light level. IMRI can also be specified with automatic profile dimming for the added benefit of a combined dimming profile with sensor detection, where the PIR sensor will override the dimming profile when occupancy is detected. Passive infrared (PIR) motion sensor, WattStopper FSP-211, equipped with lens choice specified. Available from 120V to 277V input only. Motion sensor off state power is 0.0 watts. The FSP-211 can also be reprogrammed with WattStopper's FS1R-100 remote programming tool accessory.

DCC: Dual Circuit Control permits separate switching of 32L models only, where a quantity of (2) 16 LED modules are controlled independently by use of two sets of leads, one for each module.

SW

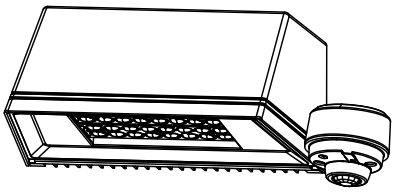
SiteWise option is a fully integrated controller that connects to SiteWise system in order to offer a complete area lighting management system. The communication signal is based on patented central dimming technology. SiteWise delivers it deliver optimal energy savings using your site's existing cabling. No additional wiring required, installation and commissioning are simple. An intuitive, mobile app makes it easy for authorized users to set schedules to meet site specific lighting needs, local regulations, and energy codes.

Wireless system: 101L luminaires are available with optional wireless controllers ready to be connected to a Limelight system (sold by other). The system allows you to Wirelessly manage the entire site, independent lighting groups or individual luminaires while on-site or remotely.
Based on a high density mesh network with an easy to use web-based portal, you can conveniently access, monitor and manage your lighting network remotely. Wireless System can be combined with site and area, pedestrian, and parking garage luminaires as well, for a completely connected outdoor.

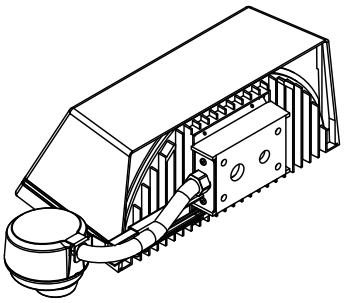
Luminaire options (continued)

F1: Fusing Single (for 120, 277 or 347VAC)

F2: Fusing Double (for 208, 240 or 480VAC)



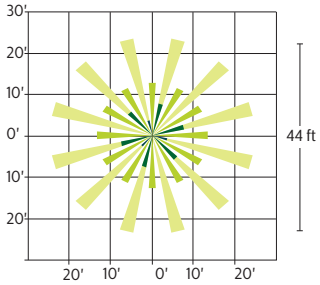
F3: Fusing Canadian Double Pull (for 208, 240 or 480VAC)



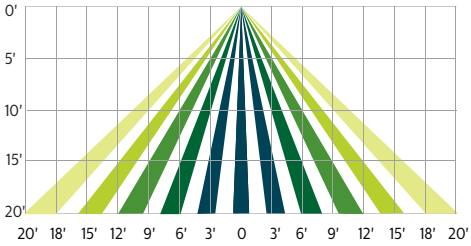
EBPC: Emergency battery pack is cold weather rated down to -20C (-4F) and integral to the luminaire , allowing for a consistent look between emergency and non-emergency sconces. A separate surface mount accessory box is not required. Dual light engines (32L) are wired in parallel, both operating in emergency mode to meet various redundancy lamp requirements. Also available with single light engine (16L). Secondary driver with relay immediately detects AC power loss and powers luminaire for a minimum of 90 minutes from the time power is lost.

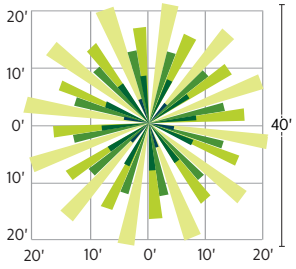
Infrared Motion Response and Wireless system sensor coverage patterns

LLC2/3 Luminaire mounted controller

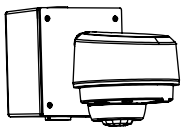


Controller attached to luminaire and Includes radio, photocell and motion sensor with #2 or #3 lens for 8-20' mounting heights.

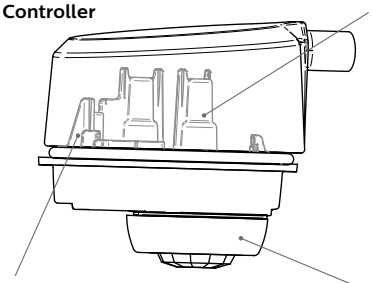




IMRI2/LLC2/LLCR2



IMRI3/LLC3/LLCR3



Remote Mount Wireless Controller

Used to extend the communication on site, to extend motion response and add other luminaires that are not pole mounted. Consult factory for more information.

Controller

Wireless Radio

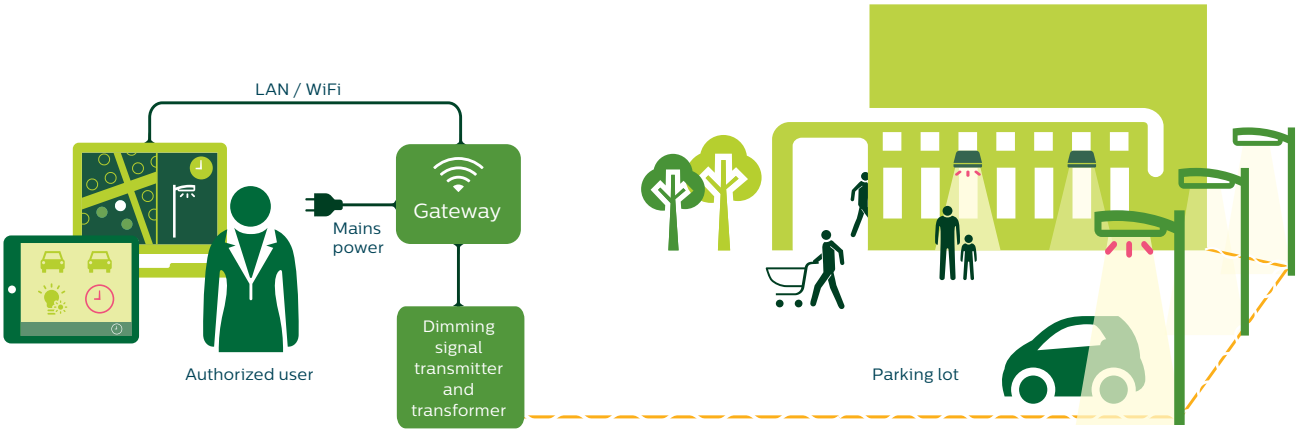
- 1.8 Watts max (no load draw)
- Operating voltage 120-277 VAC RMS
- Communicates using the ZigBee protocol
- Carries out dimming commands from Gateway
- Reports ambient light readings to 1500 Ft-Cd
- Transmission Systems Operating within the band 2400-2483.5Mhz
- ROHS Compliant

Photocell

- Ambient light photocell on every wireless radio that averages the light levels of up to 5 controllers for an accurate reading and optimal light harvesting activity.
- Reports ambient light readings to 1500 Fc.

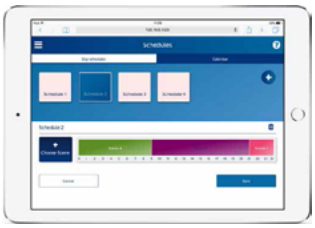
Motion Response

- Detects motion through passive infrared sensing technology with three different lens configurations
- Motion sensor coverage can be adjusted from a narrow to a wide detection range, which helps reduce false triggers to further increase energy savings.
- Sensing profiles can be updated to adapt to activity levels in the environment, such as occupancy level, wind, and mounting height



101L Sconce LED

Wall Mount



SiteWise system

SiteWise is a complete area lighting management system including a luminaire integrated controller, dimming signal transmitter cabinet, and locally accessible user interface. Installation and commissioning are simple. The cabinet communicates with the luminaires using a patented central dimming technology. The control signal is embedded on the existing electrical line – no new cabling is required. An intuitive, locally accessible interface makes it easy for authorized users to set schedules in order to meet site specific lighting needs, local regulations, and energy codes.

SiteWise system diagram

SiteWise system interface

SiteWise has an intuitive user interface that makes it easy to plan, edit, and implement lighting schedules for your site. Authorized users can access the interface via a local app.

To ensure that only authorized users can access your lighting, SiteWise offers two user types, each with different permissions. An advanced user, or administrator, can set and edit schedules using the ten pre-set scenes, assign those schedules to calendar days, and check system status.

For everyday use, a basic user can manually override a schedule that is currently running but cannot create or edit schedules.

SiteWise system specifications

The SiteWise system includes both luminaires and controls. The controls used for SiteWise are circuit load dependent. Required for a complete installation are the following SiteWise components: user interface, control kit, dimming signal transmitter cabinet, and dimming signal receiver located in the luminaire (**SW** option). Optional luminaire-integrated or external motion sensors may also be specified as required. Within the electrical closet, the control kit and dimming signal transmitter cabinet are installed into the electrical system between the existing breaker panel and the site luminaires. New LED luminaires containing the dimming signal receiver are installed on the site. Once completed, use of the interface allows for scheduling and override capabilities. Wireless access point and tablet should be supplied by others. Complete information on the control system can be found on the SiteWise website at **philips.com/sitewise**

101L Sconce LED

Wall Mount

Specifications

Housing

Main body cast housing and back plate made of a low copper die cast Aluminum alloy for a high resistance to corrosion, 0.100" (2.5mm) minimum thickness. Hinged door allows access to driver and LED compartment.

Mounting

Mounting is completed through integral back plate that features a separate recessed feature for hook and lock quick mount plate that secures with two set screws from bottom of luminaire. Mounting plate is located in the center of the luminaire width and 3.5" above the luminaire bottom (lens down position). Luminaire ships fully assembled, ready to install.

Light Engine

Composed of 4 main components: Heat Sink / LED Module / Optical System / Driver. Electrical components are RoHS compliant. IP66 sealed light engines. LEDs tested by ISO 17025-2005 accredited lab in accordance with IESNA LM-80 guidelines extrapolations in accordance with IESNA TM-21. Metal core board ensures greater heat transfer and longer lifespan.

Heat Sink

Integral door/heat sink design made of low copper die cast Aluminum alloy for a high resistance to corrosion.

LED Module

Composed of high performance white LEDs. Color temperature as per ANSI/NEMA bin Neutral White, 4000K nominal (+/- 275K), CRI 70 Min. Available in other color temperatures including Cool White, 5700K and Warm White, 3000K.

SiteWise Network System

SiteWise system includes a controller fully integrated in the luminaire that enables the luminaires to communicate with a dimming signal transmitter cabinet located on site using patented central dimming technology. A locally accessible mobile app allows users to access the system and set functionalities such as ON/OFF, dimming levels and scheduling. SiteWise is available with motion response options in order to bring the light back to 100% when motion is detected. Additional functionalities are available such as communication with indoor lighting and connection to BMS systems.

Hardware

All exposed screws shall be stainless and/or corrosion resistant and captive.

Optical System

The advanced LED optical systems provide IES Types 2, 3, 4. Composed of high performance UV stabilized optical grade polymer refractor lenses to achieve desired distribution optimized to get maximum spacing, target lumens and a superior lighting uniformity. System is rated IP66. Performance shall be tested per LM-63, LM-79 and TM-15 (IESNA) certifying its photometric performance. Dark sky compliant with 0% uplight and U0 per IESNA TM-15.

Driver

High power factor of 90% min. Electronic driver, operating range 50/60 Hz. Auto adjusting universal voltage input from 120 to 277 VAC or 347 to 480 VAC rated for both application line to line or line to neutral, Class I, THD of 20% max. The current supplying the LEDs will be reduced by the driver if the driver experiences internal overheating as a protection to the LEDs and the electrical components. Output is protected from short circuits, voltage overload and current overload. Automatic recovery after correction. Standard built in driver surge protection of 2.5kV (min).

Surge Protection

Each luminaire is provided as standard with surge protector (designed SP1) tested in accordance with ANSI/IEEE C62.45 per ANSI/IEEE C62.41.2 Scenario I Category C High Exposure 10kV/5kA waveforms for Line Ground, Line Neutral and Neutral Ground, and in accordance with U.S. DOE (Department of Energy) MSSLC (Municipal Solid State Street Lighting Consortium) Model Specification for LED Roadway Luminaires Appendix D Electrical Immunity High Test Level 10kV / 5kA.

Wiring (supplied by others)

Splices must be made in the junction box.

Finish

Five standard colors offered in textured black, white, bronze, dark gray and medium gray. Color in accordance with the AAMA 2604 standard. Application of polyester powder coat paint 2.5 mils minimum. The thermosetting resins provides a discoloration resistant finish in accordance with the ASTM D2244 standard, as well as luster retention in keeping with the ASTM D523 standard and humidity proof in accordance with the ASTM D2247 standard. RAL and custom color matching available.

LED Products Manufacturing Standard

The electronic components sensitive to electrostatic discharge (ESD) such as light emitting diodes (LEDs) are assembled in compliance with EC61340-5-1 and ANSI/ESD S20.20 standards so as to eliminate ESD events that could decrease the useful life of the product.

LED Useful Life

Luminaire Useful Life accounts for LED lumen maintenance. Refer to IES files for energy consumption and delivered lumens for each option. Based on ISTMT in situ thermal testing in accordance with UL1598 and UL8750, LED LM-80/TM-21, expected to reach 100,000 + hours with >L70 lumen maintenance @ 25°C.

Certifications and Compliance

cULus Listed for Canada and USA suitable for wet locations when mounted downward facing. cULus Listed for Canada and USA suitable for damp locations when inverted upward facing when mounted in covered ceiling application. Emergency Battery Pack option is tested and listed to UL924 and CSA C22.2 No. 141-10 DesignLights Consortium qualified on models as listed on DLC QPL. Luminaire is rated for operation in ambient temperature of -40°C (-40°F) up to +40°C (+104°F).

Limited Warranty

5-year limited warranty. See philips.com/warranties for details and restrictions.
Visit our eCatalog or contact your local sales representative for more information.

Wall Mount

LED Performance

Predicted lumen depreciation data[1]				
Ambient Temperature (°C)	Driver mA	Calculated L_{70} hours[1,2]	L_{70} per TM-21[2,3]	Lumen Maintenance % @ 60,000 hours
25°C	up to 1200 mA	>100,000	>60,000	88%

1. Predicted performance derived from LED manufacturer's data and engineering design estimates, based on IESNA LM-80 methodology. Actual experience may vary due to field application conditions.
2. L_{70} is the predicted time when LED performance depreciates to 70% of initial lumen output.
3. Calculated per IESNA TM21-11. Published L_{70} hours limited to 6 times actual LED test hours.

Section 18
Solid Waste

Overview:

Chapter 373 §§ 3 of the Site Law Regulations requires that applicant demonstrate that adequate provision for solid waste disposal.

A. Anticipated Solid Waste Narrative

The proposed Maine Behavioral Healthcare building will handle solid waste in the same fashion and with the same contractors as is currently contracted at the adjacent Spring Harbor Hospital.

The construction and operation of this project will result in the following types of solid waste.

- Stumps and Grubbings
- Construction Debris
- Commercial Solid Waste
- Medical Waste
- Recycled Waste
  - Cardboard and Paper
  - Shredded documents

B. Stumps and Grubbings

Based on a typical generation rate of 400 cubic yards (cy) of stumps and grubbings per acre for forested area, the development anticipates generating the following quantities.

- Forested areas – 3.40 acres x 400 cy/acres = 1,360 cy

The selected contractor will contract for the transport and disposal of these materials debris to a MeDEP licensed local waste facility in accordance with all solid waste regulations.

C. Construction Debris

Due to the nature of the construction and waste management by the selected contractor, it is anticipated that 25 cubic yards or less will be produced. Based on an assumed generation rate of 10 cubic yards (cy)/ 1,500 sf of building area. The project is anticipated to produce the following quantities.

- 28,200 sf x 10 cy/1,500 sf = 188 cy

The selected contractor will utilize Waste Management for the disposal of all construction debris during the construction of this building. Waste Management will

transport all construction debris to a MeDEP licensed local waste facility in accordance with all solid waste regulations.

D. Commercial Solid Waste

Maine Behavioral Healthcare will be contracting with Waste Management for the ongoing disposal of all commercial solid waste generated in the operation of this proposed building. Waste Management will transport all commercial solid waste to an MeDEP licensed local waste facility in accordance with all solid waste regulations.

E. Medical Waste

Due to the nature of this building, very limited medical waste will be generated at this facility. Certified staff will transport sharps containers to be combined with Spring Harbor Hospital medical waste for disposal by Stericycle

E. Recyclable Waste

Secure Records Management Systems will prove secure collection, shredding and recycling of all confidential and non-confidential paper at the new Maine Behavioral Healthcare project. Cardboard will be collected and recycled by Waste Management.

F. Conclusion

The applicant has made adequate provisions for solid waste disposal by quantifying solid wastes that are anticipated to be generated by the project, specifying the methods of transport and disposal of the waste.

State and Federal Approvals

History

A Site Location of Development Act (SLODA) permit and a Natural Resources Protection Act (NRPA) Tier 2 Wetland Alteration permit were submitted on August 27, 2019. These permits were determined complete on September 18, 2019 and Jenifer McGill has been assigned as the project manager from the MDEP. The project is currently being reviewed.

On November 13, 2019 Frank Del Giudice of the Army Corps of Engineers authorized the placement of fill in freshwater wetlands as indicated on the NRPA Wetland Alteration Permit. A copy of the approval is attached.

The SLODA and State NRPA approvals are still pending and will be forwarded when they are received.

RANSOM Consulting, Inc.

Consulting Engineers and Scientists

Maine Behavioral Healthcare Stormwater Management Plan

LIST OF APPENDICES:

- Appendix A: Stormwater Treatment Calculations
- Appendix B: Stormwater BMP Inspection and Maintenance Requirements
- Appendix C: Pre-Development Calculations
- Appendix D: Post-Development Calculations

SITE DESCRIPTION:

The site (refer to Site Location Map) is an approximately 10.9-acre lot located on the west side of Hutchins Drive and adjacent to the Spring Harbor Hospital. The parcel is bisected by Andover Road. Both the Spring Harbor Hospital parcel and Andover Road were part of a previous development. The land north of Andover Road is primarily woods with heavy underbrush in good condition and the land south of Andover Road is primarily woods with light underbrush in good condition. The topography of the undeveloped site has several higher upland areas separated by pockets of wetlands. The native soil in this location are Hydrologic Soil Groups (HSG) C and D. Stormwater runoff from the site flows into the on-site wetlands and then off-site in 8 different locations. The site is in Zone X of FEMA's Flood Insurance Rate Map (FIRM), indicating that it is outside of the 500-year floodplain.

DEVELOPMENT DESCRIPTION:

Maine Behavioral Healthcare proposes to construct an approximately 32,000 sf, 1 story building as a Center for Autism and Developmental Delays. The site will have several parking lots with approximately 119 spaces (including 6 ADA spaces), 3 access aisles, sidewalks, outdoor sitting spaces, 10,250 sf playground areas and landscaped areas. The proposed developed area which includes the proposed building, pavement and sidewalk (Post-Development sub catchments 9-20) totals 128,971 sf; of which 93,700 sf is new impervious surface and 35,270 sf is landscaped area. There will also be two outlet control structures that discharge to two analysis points. The runoff will discharge to the same points both pre and post development, with equal or decreased flows in the post development with no changes in existing channel geometry.

The Stroudwater River is north of the site, and the development is not expected to impact the water quality or quantity draining to the river. There is roughly 1,000 feet of vegetated buffer between proposed site and the Stroudwater River, with pre-development flows exceeding the expected post-development flows for 2, 10, and 25-year storms. Since post-developed flows are less than that of pre-developed flows

at all discharge points, and the parcel and abutting parcels are outside of the 500-year floodplain, site runoff from the developed site is not expected to impact flood-sensitive areas.

Grading of the site slopes away from the perimeter of the building, while maintaining ADA accessibility and matching into the existing landscape where possible. The site was designed to have slopes of 3:1 or shallower, thereby removing the need for slope stabilization materials. However, guard rails may be used at some locations of the parking lot, such as from the western parking lot area to along the northern parking lot area, though it is not required. There is approximately 3,146 sf of wetland impact.

STORMWATER MANAGEMENT – BASIC STANDARDS:

Erosion and sedimentation control measures during construction are detailed within the design plans. Post-Construction stormwater management practices and good housekeeping practices will be in accordance with Maine DEP Best Management Practices. A post construction stormwater management plan as well as inspection and maintenance requirements are provided in *Appendix B* of this Stormwater Management Plan.

STORMWATER MANAGEMENT – QUALITY (GENERAL STANDARDS):

A project must meet Maine's *Chapter 500, Stormwater Management* general standards if the project results in one or more acres of impervious area, or 5 acres or more of developed area for projects that are not within the direct watershed of an urban impaired stream or a lake most at risk (as defined by Chapter 502). To meet the general standards, the project's stormwater management system must include treatment measures that will provide pollutant removal or treatment (or both), mitigate for the increased frequency and duration of channel erosive flows due to runoff from smaller storms, and mitigate potential temperature impacts. To do that a project must provide treatment of 95% of the impervious area and no less than 80% of the developed area. In addition, runoff from upgradient areas must either be redirected away from the project's stormwater treatment measures or that measure must be sized to address the runoff volume of the upgradient area at 50% of the sizing requirements. Although the amount of on-site treatment provided may be reduced by providing treatment on a currently untreated off-site area in the same watershed, this is not proposed for this project at this time.

Treatment of stormwater is addressed using Maine's Best Management Practices (BMPs). These BMPs are focused on meeting the following water quality objectives:

- Effective pollutant removal – removal of fine particles that carry nutrient and heavy metal load as well as dissolved pollutants and hydrocarbons.
- Cooling – to protect aquatic life within a river, stream, or brook watershed discharge must effectively cool down.
- Channel protection – discharge within a river, stream, or brook watershed must be released slowly to avoid destabilization and resulting sedimentation of receiving channels.
- Flood control – detention for large, infrequent storm events to avoid flooding infrastructure.

The water quality volume is the initial depth of runoff that is considered to carry the bulk of pollutants deposited since the last rain event. Studies have indicated that the first inch of runoff distributed over the watershed carries 90% of the pollutant load from a storm event. Maine's BMPs identified in Volume III of the Maine Stormwater Management Design Manual consider this when establishing the treatment volume identified within each BMP. The BMPs chosen for this site to meet the water quality objectives include:

- Bioretention: Filtration BMP discussed in Maine's Stormwater Management Manual, Volume III, Chapter 7.2, Bioretention Filters.
- Manmade Pervious Paver Systems: Filtration BMP discussed in Maine's Stormwater Management Manual, Volume III, Chapter 7.7, Manmade Pervious Surfaces.

PROJECT SPECIFIC WATER QUALITY TREATMENT MEASURES:

The existing site is currently a mix of vegetated (wooded/scrub brush) upland areas and wetlands. The site currently drains to the wetlands on site. For water quality treatment, the site design incorporates a 12560-sf porous paver filter system along the northern, middle, and southern parking lot areas, as well two FocalPoint bioretention filter systems.

- Bioretention Filter/FocalPoint (FP): The bioretention filters consist of FocalPoint systems that collect, filter, and treat stormwater runoff using conditioned planting soil beds, gravel, underdrained beds, and vegetation within shallow depressions. They capture and retain runoff and pass it through a filter that is comprised of 2-3" of mulch, underlain by an 18" layer of proprietary soil filter media and 6" of course gravel with R-Tank storage placed below grade. The systems are designed to remove a wide range of pollutants, including suspended solids, phosphorus, nitrogen, metals, hydrocarbons, and some dissolved pollutants. The filter also provides for attenuation of discharge which provides reduction of thermal impacts to the discharge points (Analysis Points A and G) as well as minimizing potential channel erosion. The system is sized to store the treatment volume (1.0 inches times the impervious area and 0.4 inches times the landscaped developed area). For larger storms, stormwater bypasses the filter through catch basin and grate to the R-Tank system below.

  FocalPoint 1 (FP1) is a 900-sf system with 1,264 cf of surficial storage in a landscaped area northeast of the building just beyond the playground area. It is used for treatment of the paved sidewalk and path, patio, playground, and southeast portion of the building roof (sub catchments 14B, 15, and 18 on the Post-Development Plan). Runoff from the sloped roof discharges to the surface and flows to the level spreader ahead of FP1 with runoff from the playground. Runoff from the flat portion of the roof is collected and discharged through scuppers and downspouts above-ground to a stormwater channel which also directs the runoff to the level spreader ahead of FP1. The level-spreader is provided as pre-treatment. Stormwater filtered through the FocalPoint is conveyed to the R-Tank storage installed below grade, and stormwater above the treatment volume is transferred to R-Tank storage system through a catch basin and grate.

FocalPoint 2 (FP2) is a 437-sf system with 495 cf of surficial storage located on the northeast corner of the building between the parking lot and playground. It is being used exclusively to treat runoff from the flat portion of the northwest section of the building roof. The water from the roof will be captured and discharged using scuppers and downspouts to this FocalPoint system. Both filtration through the FocalPoint and bypass via catch basin and grate is directed to a subsurface R-Tank storage system. The R-Tank storage below FP2 is connected to a series of subsurface R-Tank storage areas below the multiple pervious paver systems and are interconnected with piping to provide common storage.

- Manmade Pervious Pavers (MPP): Pervious paver systems are used almost exclusively for the treatment of paved areas on site, though some systems in parking areas may see some runoff from adjacent landscaped area discharging to the system. The MPP systems consist of the Power BLOCK porous paver system by ACF Environmental underlain by a layer of 3/8" stone, then a layer of 3/4" crushed stone and finally a layer of bio-filter media for filtration for the stormwater runoff. The Power BLOCK system overlays an R-Tank storage system that will be used for detention during larger storm events. Stormwater beyond the water quality volume will be captured by catch basins which discharge to the R-tank system. The area of pervious pavers must be no less than 20% of the area being treated and the flow path to the pervious paver section must be no greater than 50 feet. Catch basins in the pervious area capture overflow from larger storms and discharge to the R-Tank system below which is interconnected with piping to provide common storage.

  The pervious pavers proposed are in sub catchments 9, 10a, 10b, 11a, 11b, 12, 13a, 13b, 13c, 16, 17, 19 shown on the Post-Development Plan and the depth of the paver systems were sized based on the magnitude of the impervious areas draining to those locations.

STORMWATER MANAGEMENT – QUANTITY (FLOODING STANDARDS):

A project must meet Maine's *Chapter 500, Stormwater Management* flooding standards if the project results in three or more acres of impervious area, or 20 acres or more of developed area. To meet the flooding standard, the project's stormwater management systems must:

- detain, retain, or result in the infiltration of stormwater from 24-hour storms of the 2-year, 10-year, and 25-year frequencies such that peak flow of stormwater from the project site do not exceed the peak flows of stormwater prior to undertaking the project;

- design the piped or open channel systems based on a 10-year, 24-hour storm without overloading or flooding beyond channel limits;

- not flood the primary access road to the project and any public roads bordering the project as a result of a 25-year, 24-hour storm event

A project is eligible for a waiver from the flooding standard for insignificant increases in peak flow rates from a project site. A waiver is also available for a project in the watershed of a coastal wetland, great pond, or major river segment provided the stormwater is conveyed via sheet flow, in a manmade open channel, or in a piped system directly into one of these resources.

The use of the R-Tank modules by ACF Environmental will detain the stormwater runoff to below pre-development conditions to comply with the Flooding Standard. The proposed detention system consists of a series of R-Tanks located below all pervious paver systems as well as FocalPoint filtration systems. The R-Tanks below the pavers and FP2 are interconnected with corrugated polyethylene, smooth interior pipe to capture and store the larger volume storms prior to discharge. A separate R-Tank system is used to store runoff from FP2.

Each storage system discharges through an outlet control structure that ultimately discharges to a plunge pool. For the northern R-Tank system (MPP and FP2), the R-Tanks were all placed at an elevation of 55.20 ft. Therefore, the water level throughout the system rises at an equal rate. The surface area of the R-Tank was sized as to not exceed the bottom of the filter layer of the paver system. Discharge from the R-Tank storage systems goes through an outlet control structure that uses orifices and a weir to release the discharge to Analysis Points A and G at a controlled rate; commensurate with a particular rainfall event.

Additionally, it should be noted that there is an existing 18" culvert at station 19+60 that drains from the southern to northern side of Andover Road. However, the flow rate discharged through the culvert has no affect on the development of Maine Behavioral Healthcare as the culvert drains to the same wetland both before and after the development. The project does not propose to upgrade the existing culvert because post-development flows are the same as pre-development flows. The site layout was designed to minimize impact on this wetland.

Stormwater runoff in the pre and post-development conditions are evaluated at Analysis Points A-H. The development of the site influences only Analysis Points A, F, G, and H. Sub catchments in the post-development condition were established based on subareas used to define treatment boundaries. The runoff at all analysis points in the post-development condition are either equal to or less than the flow in the pre-development condition. Pre-Development stormwater plans and pre-development HydroCAD calculations are included in *Appendix C* while Post-Development stormwater plans and post-development HydroCAD calculations are included in *Appendix D*.

- HydroCAD Modeling Assumptions: All soils in the developed areas have a Hydrologic Soil Group (HSG) rating of C/D or D. To provide a conservative estimate of expected flows discharging from the site, it was assumed that all soils had a HSG rating of D, since these soils have less permeability and higher runoff potential than that of C.
    - Areas of sub catchments were determined using AutoCAD.
    - Times of concentration beginning at Andover Road and ending at analyses points was assumed to flow 15 feet as sheet flow from the crown to the side of the road over a smooth surface with a Manning's number of 0.011 and a slope of 5%. The water then flows an additional 135 feet as sheet flow (150 feet of sheet flow total), and the remainder of the time of concentration path flowing as shallow concentrated flow.
    - Slopes of time of concentration paths were based on the survey conducted by Titcomb Associates in May of 1997, overlaid with the grading plan of Andover Road.

- For flow over developed impervious areas with a curve number of 98, the time of concentration was assumed to be 6 minutes in accordance with Maine DEP guidance documents. The non-developed vegetated areas north of Andover Road was assumed to be in good condition with a curve number of 77, with sheet flow traveling over dense underbrush woods with a Manning number of 0.8, and shallow concentrated flow traveling over forest with heavy litter with a velocity factor of 2.5.

- The non-developed vegetated areas south of Andover Road were assumed to be in good condition with a curve number of 77, with sheet flow traveling over light underbrush woods with a Manning number of 0.4, and shallow concentrated flow traveling over forest with heavy litter with a velocity factor of 2.5.

- Developed landscaped areas were assumed to be >75% grass cover in good condition with a curve number of 80 and paved impervious areas were assumed to have a curve number of 98.

- Because the playground material has not yet been finalized it was assumed to be impervious with a curve number of 98 as a conservative estimate to predict runoff.

HYDRAULIC ANALYSIS:

Stormwater runoff calculations for quantity were made using the HydroCAD 10.00 computer program, which is based on the Soil Conservation Service's TR-20 methodology. Runoff hydrographs are generated based on a standard Type III 24-hour storm for Cumberland County identified in Appendix H of *Maine DEP Chapter 500, Stormwater Management.*

Four storm events were evaluated as follows:

- 2-year frequency flood event: 3.1" rainfall

- 10-year frequency flood event: 4.6" rainfall

- 25-year frequency flood event: 5.8" rainfall

Runoff Curve numbers were determined based on land coverage and hydro-geological soil type D. Times of concentration were developed based on runoff flow paths for each subarea and shown on the Pre and Post-Development plans. A minimum Tc of 6 minutes was used in the HydroCAD model.

Peak runoff flow rates and runoff volumes are provided at the analysis points, which are identified on the Pre and Post-Development plans. Comparison of the runoff peak flow rates are provided at each analysis point on Tables 1-3 below :

Table 1 – 2-year, 24-hour Storm

Analysis Point	Pre-Development	Post-Development
A	1.08 cfs	1.01 cfs
B	0.63 cfs	0.63 cfs
C	1.18 cfs	1.18 cfs
D	1.46 cfs	1.46 cfs
E	0.32 cfs	0.32 cfs
F	0.39 cfs	0.33 cfs
G	0.56 cfs	0.35 cfs
H	0.34 cfs	0.09 cfs

Table 2 – 10-year, 24-hour Storm

Analysis Point	Pre-Development	Post-Development
A	2.20 cfs	2.05 cfs
B	1.28 cfs	1.28 cfs
C	2.39 cfs	2.39 cfs
D	2.95 cfs	2.95 cfs
E	0.58 cfs	0.58 cfs
F	0.77 cfs	0.59 cfs
G	1.16 cfs	0.79 cfs
H	0.71 cfs	0.18 cfs

Table 3 – 25-year, 24-hour Storm

Analysis Point	Pre-Development	Post-Development
A	3.19 cfs	2.84 cfs
B	1.84 cfs	1.84 cfs
C	3.43 cfs	3.43 cfs
D	4.24 cfs	4.24 cfs

Maine Behavioral Healthcare Stormwater Management Plan

LIST OF APPENDICES:

- Appendix A: Stormwater Treatment Calculations
- Appendix B: Stormwater BMP Inspection and Maintenance Requirements
- Appendix C: Pre-Development Calculations
- Appendix D: Post-Development Calculations

SITE DESCRIPTION:

The site (refer to Site Location Map) is an approximately 10.9-acre lot located on the west side of Hutchins Drive and adjacent to the Spring Harbor Hospital. The parcel is bisected by Andover Road. Both the Spring Harbor Hospital parcel and Andover Road were part of a previous development. The land north of Andover Road is primarily woods with heavy underbrush in good condition and the land south of Andover Road is primarily woods with light underbrush in good condition. The topography of the undeveloped site has several higher upland areas separated by pockets of wetlands. The native soil in this location are Hydrologic Soil Groups (HSG) C and D. Stormwater runoff from the site flows into the on-site wetlands and then off-site in 8 different locations. The site is in Zone X of FEMA's Flood Insurance Rate Map (FIRM), indicating that it is outside of the 500-year floodplain.

DEVELOPMENT DESCRIPTION:

Maine Behavioral Healthcare proposes to construct an approximately 30,000 sf, 1 story building as a Center for Autism and Developmental Delays. The site will have several parking lots with approximately 119 spaces (including 6 ADA spaces), 3 access aisles, sidewalks, outdoor sitting spaces, playground areas and landscaped areas. The proposed developed area which includes the proposed building, pavement and sidewalk (Post-Development sub catchments 9-20) totals 130333; of which 97,619 sf is new impervious surface and 32,714 sf is landscaped area. There will also be two outlet control structures that discharge to two analysis points. The runoff will discharge to the same points both pre and post development, with equal or decreased flows in the post development with no changes in existing channel geometry.

The Stroudwater River is north of the site, and the development is not expected to impact the water quality or quantity draining to the river. There is roughly 1,000 feet of vegetated buffer between proposed site and the Stroudwater River, with pre-development flows exceeding the expected post-development flows for 2, 10, and 25-year storms. Since post-developed flows are less than that of pre-developed flows

at all discharge points, and the parcel and abutting parcels are outside of the 500-year floodplain, site runoff from the developed site is not expected to impact flood-sensitive areas.

Grading of the site slopes away from the perimeter of the building, while maintaining ADA accessibility and matching into the existing landscape where possible. The site was designed to have slopes of 3:1 or shallower, thereby removing the need for slope stabilization materials. However, guard rails may be used at some locations of the parking lot, such as from the western parking lot area to along the northern parking lot area, though it is not required. There is approximately 3,146 sf of wetland impact.

STORMWATER MANAGEMENT – BASIC STANDARDS:

Erosion and sedimentation control measures during construction are detailed within the design plans. Post-Construction stormwater management practices and good housekeeping practices will be in accordance with Maine DEP Best Management Practices. A post construction stormwater management plan as well as inspection and maintenance requirements are provided in *Appendix B* of this Stormwater Management Plan.

STORMWATER MANAGEMENT – QUALITY (GENERAL STANDARDS):

A project must meet Maine's *Chapter 500, Stormwater Management* general standards if the project results in one or more acres of impervious area, or 5 acres or more of developed area for projects that are not within the direct watershed of an urban impaired stream or a lake most at risk (as defined by Chapter 502). To meet the general standards, the project's stormwater management system must include treatment measures that will provide pollutant removal or treatment (or both), mitigate for the increased frequency and duration of channel erosive flows due to runoff from smaller storms, and mitigate potential temperature impacts. To do that a project must provide treatment of 95% of the impervious area and no less than 80% of the developed area. In addition, runoff from upgradient areas must either be redirected away from the project's stormwater treatment measures or that measure must be sized to address the runoff volume of the upgradient area at 50% of the sizing requirements. Although the amount of on-site treatment provided may be reduced by providing treatment on a currently untreated off-site area in the same watershed, this is not proposed for this project at this time.

Treatment of stormwater is addressed using Maine's Best Management Practices (BMPs). These BMPs are focused on meeting the following water quality objectives:

- Effective pollutant removal – removal of fine particles that carry nutrient and heavy metal load as well as dissolved pollutants and hydrocarbons.
- Cooling – to protect aquatic life within a river, stream, or brook watershed discharge must effectively cool down.
- Channel protection – discharge within a river, stream, or brook watershed must be released slowly to avoid destabilization and resulting sedimentation of receiving channels.
- Flood control – detention for large, infrequent storm events to avoid flooding infrastructure.

The water quality volume is the initial depth of runoff that is considered to carry the bulk of pollutants deposited since the last rain event. Studies have indicated that the first inch of runoff distributed over the watershed carries 90% of the pollutant load from a storm event. Maine's BMPs identified in Volume III of the Maine Stormwater Management Design Manual consider this when establishing the treatment volume identified within each BMP. The BMPs chosen for this site to meet the water quality objectives include:

- Bioretention: Filtration BMP discussed in Maine's Stormwater Management Manual, Volume III, Chapter 7.2, Bioretention Filters.

- Manmade Pervious Paver Systems: Filtration BMP discussed in Maine's Stormwater Management Manual, Volume III, Chapter 7.7, Manmade Pervious Surfaces.

PROJECT SPECIFIC WATER QUALITY TREATMENT MEASURES:

The existing site is currently a mix of vegetated (wooded/scrub brush) upland areas and wetlands. The site currently drains to the wetlands on site. For water quality treatment, the site design incorporates a 13,950-sf porous paver filter system along the northern, middle, and southern parking lot areas, as well two FocalPoint bioretention filter systems.

- Bioretention Filter/FocalPoint (FP): The bioretention filters consist of FocalPoint systems that collect, filter, and treat stormwater runoff using conditioned planting soil beds, gravel, underdrained beds, and vegetation within shallow depressions. They capture and retain runoff and pass it through a filter that is comprised of 2-3" of mulch, underlain by an 18" layer of proprietary soil filter media and 6" of course gravel with R-Tank storage placed below grade. The systems are designed to remove a wide range of pollutants, including suspended solids, phosphorus, nitrogen, metals, hydrocarbons, and some dissolved pollutants. The filter also provides for attenuation of discharge which provides reduction of thermal impacts to the discharge points (Analysis Points A and G) as well as minimizing potential channel erosion. The system is sized to store the treatment volume (1.0 inches times the impervious area and 0.4 inches times the landscaped developed area). For larger storms, stormwater bypasses the filter through catch basin and grate to the R-Tank system below.

  FocalPoint 1 (FP1) is a 900-sf system with 1,305 cf of surficial storage in a landscaped area northeast of the building just beyond the playground area. It is used for treatment of the paved sidewalk and path, patio, playground, southeast portion of the building roof, and proposed addition (sub catchments 14D, 15, and 18 on the Post-Development Plan). Runoff from the sloped roof discharges to the surface and flows to the level spreader ahead of FP1 with runoff from the playground. Runoff from the flat portion of the roof is collected and discharged through scuppers and downspouts above-ground to a stormwater channel which also directs the runoff to the level spreader ahead of FP1. The level-spreader is provided as pre-treatment. Stormwater filtered through the FocalPoint is conveyed to the R-Tank storage installed below grade, and stormwater above the treatment volume is transferred to R-Tank storage system through a catch basin and grate.

FocalPoint 2 (FP2) is a 386-sf system with 296 cf of surficial storage located on the northeast corner of the building between the parking lot and playground. It is being used exclusively to treat runoff from the flat portion of the northwest section of the building roof. The water from the roof will be captured and discharged using scuppers and downspouts to this FocalPoint system. Both filtration through the FocalPoint and bypass via catch basin and grate is directed to a subsurface R-Tank storage system. The R-Tank storage below FP2 is connected to a series of subsurface R-Tank storage areas below the multiple pervious paver systems and are interconnected with piping to provide common storage. The FocalPoint is next to the proposed staff patio. An ACF Environmental PRETX Drop Inlet is used as a pretreatment system and decreases the flow rate from the roof drains to the biofiltration system.

FocalPoint 3 (FP3) is a 325-sf with 203 cf of surficial storage located on the northwest side of the rear entrance. It is being used exclusively to treat runoff from the flat portion of the north-central section of the building roof. The water from the roof will be captured and discharged using scuppers and downspouts to this FocalPoint system. Both filtration through the FocalPoint and bypass via catch basin and grate is directed to a subsurface R-Tank storage system. The R-Tank storage below FP3 is connected to a series of subsurface R-Tank storage areas below FP 1, 3, and 4 in the playground area, and are interconnected with piping to provide common storage. The FocalPoint is next to the proposed staff patio. An ACF Environmental PRETX Drop Inlet is used as a pretreatment system and decreases the flow rate from the roof drains to the biofiltration system.

FocalPoint 4 (FP4) is a 158-sf system with 109 cf of surficial storage location on the southeast side of the rear entrance. It is being used exclusively to treat runoff from the flat portion of the south-central section of the building roof and the 3064 sf overhang of the north side of the building. The water from the roof will be captured and discharged using scuppers and downspouts to this FocalPoint system. Both filtration through the FocalPoint and bypass via catch basin and grate is directed to a subsurface R-Tank storage system. The R-Tank storage below FP3 is connected to a series of subsurface R-Tank storage areas below FP 1, 3, and 4 in the playground area, and are interconnected with piping to provide common storage. The FocalPoint is next to the proposed staff patio. An ACF Environmental PRETX Drop Inlet is used as a pretreatment system and decreases the flow rate from the roof drains to the biofiltration system.

- Manmade Pervious Pavers (MPP): Pervious paver systems are used almost exclusively for the treatment of paved areas on site, though some systems in parking areas may see some runoff from adjacent landscaped area discharging to the system. The MPP systems consist of the Power BLOCK porous paver system by ACF Environmental underlain by a layer of 3/8" stone, then a layer of 3/4" crushed stone and finally a layer of bio-filter media for filtration for the stormwater runoff. The Power BLOCK system overlays an R-Tank storage system that will be used for detention during larger storm events. Stormwater beyond the water quality volume will be captured by catch basins which discharge to the R-tank system. The area of pervious pavers must be no less than 20% of the area being treated and the flow path to the pervious paver section must be no greater than 50 feet. Catch basins in the pervious area capture overflow from larger storms and discharge to the R-Tank system below which is interconnected with piping to provide common storage.

The pervious pavers proposed are in sub catchments 9, 10a, 10b, 11a, 11b, 12, 13a, 13b, 13c, 16, 17, 19 shown on the Post-Development Plan and the depth of the paver systems were sized based on the magnitude of the impervious areas draining to those locations.

STORMWATER MANAGEMENT – QUANTITY (FLOODING STANDARDS):

A project must meet Maine's *Chapter 500, Stormwater Management* flooding standards if the project results in three or more acres of impervious area, or 20 acres or more of developed area. To meet the flooding standard, the project's stormwater management systems must:

- detain, retain, or result in the infiltration of stormwater from 24-hour storms of the 2-year, 10-year, and 25-year frequencies such that peak flow of stormwater from the project site do not exceed the peak flows of stormwater prior to undertaking the project;

- design the piped or open channel systems based on a 10-year, 24-hour storm without overloading or flooding beyond channel limits;

- not flood the primary access road to the project and any public roads bordering the project as a result of a 25-year, 24-hour storm event

A project is eligible for a waiver from the flooding standard for insignificant increases in peak flow rates from a project site. A waiver is also available for a project in the watershed of a coastal wetland, great pond, or major river segment provided the stormwater is conveyed via sheet flow, in a manmade open channel, or in a piped system directly into one of these resources.

The use of the R-Tank modules by ACF Environmental will detain the stormwater runoff to below pre-development conditions to comply with the Flooding Standard. The proposed detention system consists of a series of R-Tanks located below all pervious paver systems as well as FocalPoint filtration systems. The R-Tanks below the pavers and FP2 are interconnected with corrugated polyethylene, smooth interior pipe to capture and store the larger volume storms prior to discharge. A separate R-Tank system is used to store runoff from FP2.

Each storage system discharges through an outlet control structure that ultimately discharges to a plunge pool. For the northern R-Tank system (MPP and FP2), the R-Tanks were all placed at an elevation of 54 ft. Therefore, the water level throughout the system rises at an equal rate. The surface area of the R-Tank was sized as to not exceed the bottom of the filter layer of the paver system. Discharge from the R-Tank storage systems goes through an outlet control structure that uses orifices and a weir to release the discharge to Analysis Points A and G at a controlled rate; commensurate with a particular rainfall event.

Additionally, it should be noted that there is an existing 18" culvert at station 19+60 that drains from the southern to northern side of Andover Road. However, the flow rate discharged through the culvert has no affect on the development of Maine Behavioral Healthcare as the culvert drains to the same wetland both before and after the development. The project does not propose to upgrade the existing culvert because post-development flows are the same as pre-development flows. The site layout was designed to minimize impact on this wetland.

Stormwater runoff in the pre and post-development conditions are evaluated at Analysis Points A-H. The development of the site influences only Analysis Points A, F, G, and H. Sub catchments in the post-development condition were established based on subareas used to define treatment boundaries. The runoff at all analysis points in the post-development condition are either equal to or less than the flow in the pre-development condition. Pre-Development stormwater plans and pre-development HydroCAD calculations are included in *Appendix C* while Post-Development stormwater plans and post-development HydroCAD calculations are included in *Appendix D*.

- HydroCAD Modeling Assumptions: All soils in the developed areas have a Hydrologic Soil Group (HSG) rating of C/D or D. To provide a conservative estimate of expected flows discharging from the site, it was assumed that all soils had a HSG rating of D, since these soils have less permeability and higher runoff potential than that of C.
    - Areas of sub catchments were determined using AutoCAD.
    - Times of concentration beginning at Andover Road and ending at analyses points was assumed to flow 15 feet as sheet flow from the crown to the side of the road over a smooth surface with a Manning's number of 0.011 and a slope of 5%. The water then flows an additional 135 feet as sheet flow (150 feet of sheet flow total), and the remainder of the time of concentration path flowing as shallow concentrated flow.
    - Slopes of time of concentration paths were based on the survey conducted by Titcomb Associates in May of 1997, overlaid with the grading plan of Andover Road.
    - For flow over developed impervious areas with a curve number of 98, the time of concentration was assumed to be 6 minutes in accordance with Maine DEP guidance documents. The non-developed vegetated areas north of Andover Road was assumed to be in good condition with a curve number of 77, with sheet flow traveling over dense underbrush woods with a Manning number of 0.8, and shallow concentrated flow traveling over forest with heavy litter with a velocity factor of 2.5.
    - The non-developed vegetated areas south of Andover Road were assumed to be in good condition with a curve number of 77, with sheet flow traveling over light underbrush woods with a Manning number of 0.4, and shallow concentrated flow traveling over forest with heavy litter with a velocity factor of 2.5.
    - Developed landscaped areas were assumed to be >75% grass cover in good condition with a curve number of 80 and paved impervious areas were assumed to have a curve number of 98.
    - Because the playground material has not yet been finalized it was assumed to be impervious with a curve number of 98 as a conservative estimate to predict runoff.

HYDRAULIC ANALYSIS:

Stormwater runoff calculations for quantity were made using the HydroCAD 10.00 computer program, which is based on the Soil Conservation Service's TR-20 methodology. Runoff hydrographs are generated based on a standard Type III 24-hour storm for Cumberland County identified in Appendix H of *Maine DEP Chapter 500, Stormwater Management.*

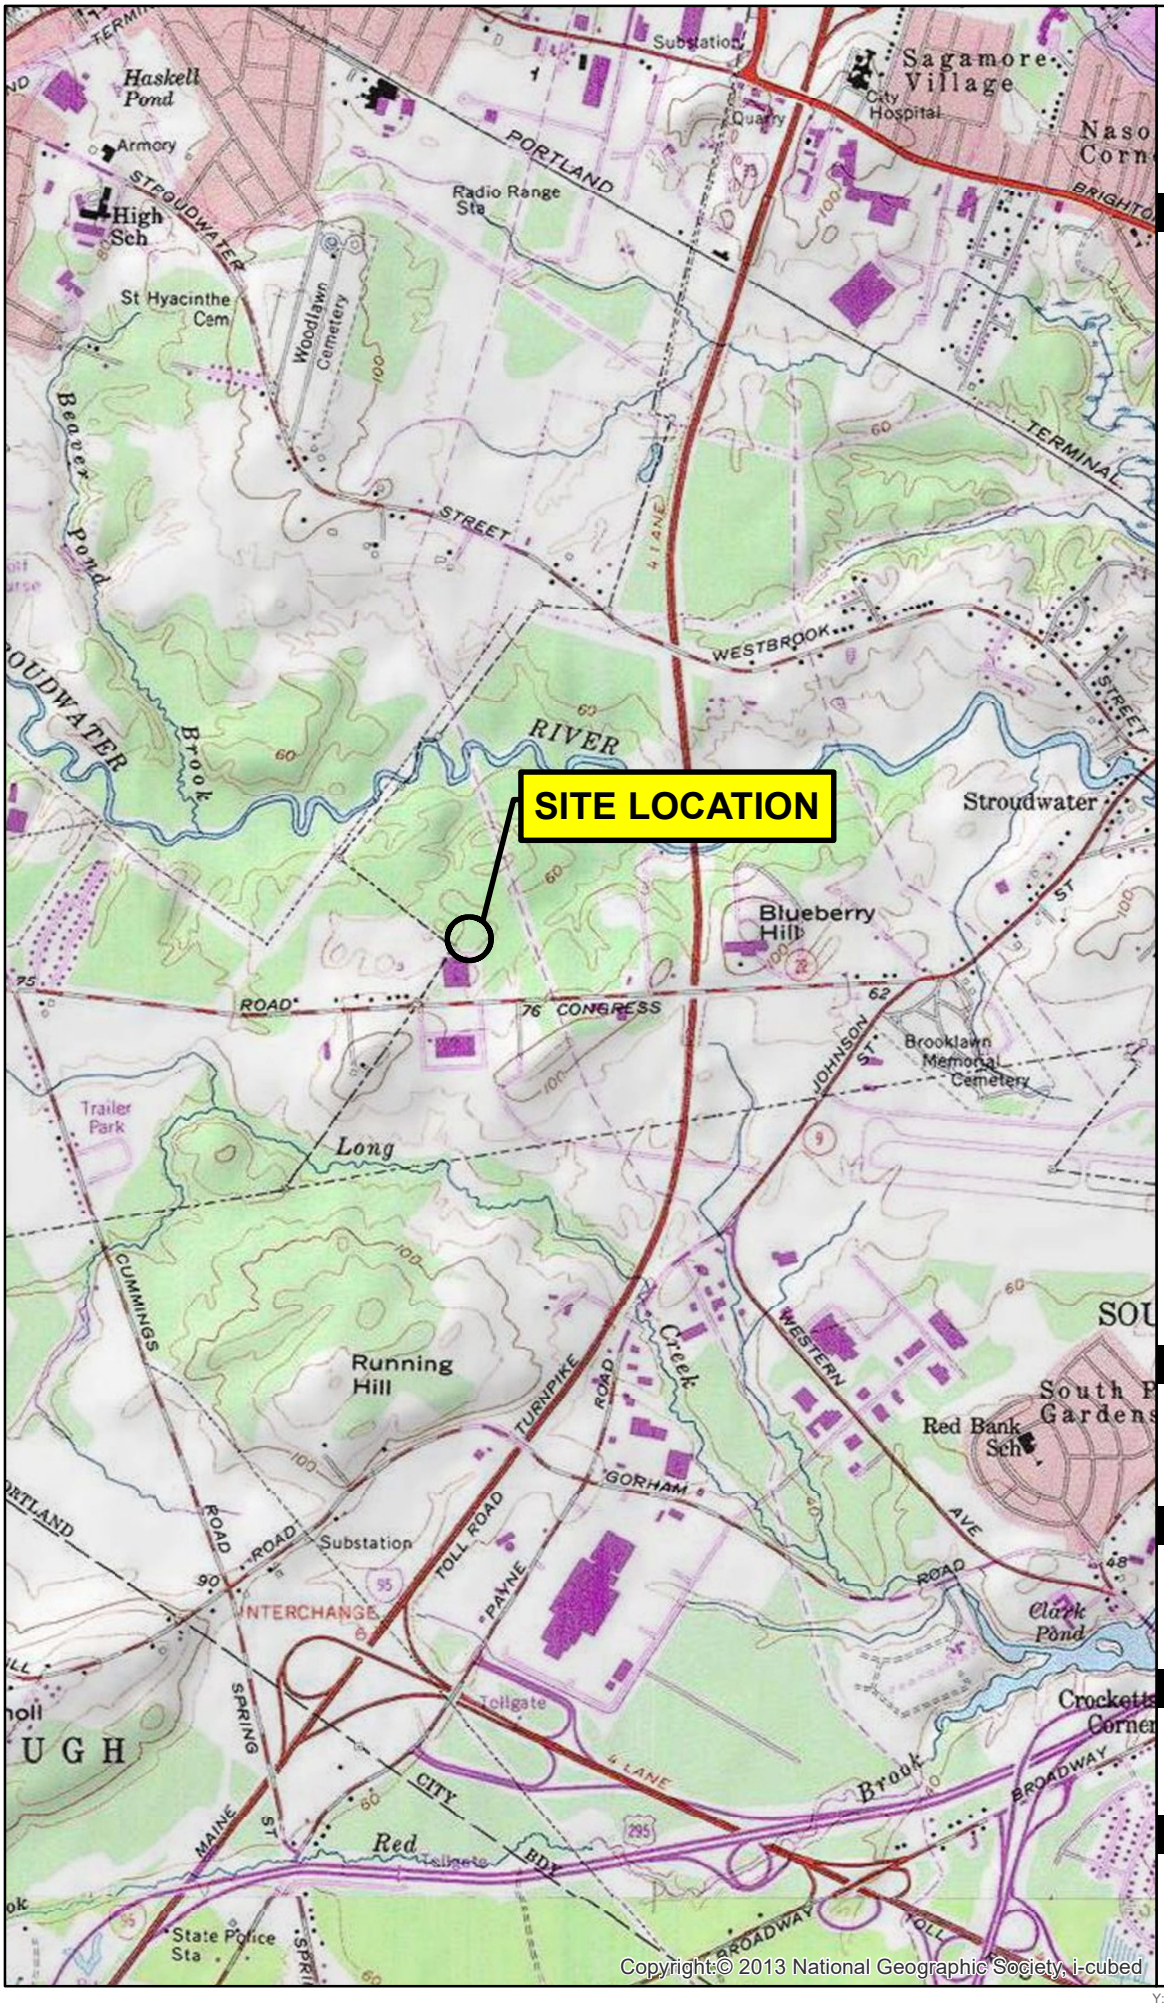
Four storm events were evaluated as follows:

- 2-year frequency flood event: 3.1" rainfall
- 10-year frequency flood event: 4.6" rainfall
- 25-year frequency flood event: 5.8" rainfall

Runoff Curve numbers were determined based on land coverage and hydro-geological soil type D. Times of concentration were developed based on runoff flow paths for each subarea and shown on the Pre and Post-Development plans. A minimum Tc of 6 minutes was used in the HydroCAD model.

Peak runoff flow rates and runoff volumes are provided at the analysis points, which are identified on the Pre and Post-Development plans. Comparison of the runoff peak flow rates are provided at each analysis point on Tables 1-3 below :

Table 1 – 2-year, 24-hour Storm



Analysis Point	Pre-Development	Post-Development
A	1.08 cfs	0.94 cfs

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Cumberland County and Part of Oxford County, Maine
Survey Area Data: Version 15, Sep 6, 2018

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Data not available.

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

1. FocalPoint Bed Area (min 174 square feet per acre of impervious area (e.g. 0.2 acres = 35 sf))

- Tributary Impervious area = _____ ac. (A)
- Tributary Pervious area = _____ ac. (B)
- Min FocalPoint bed area req'd = (((A) x 1.0) + ((B) x 0.4)) * 174 = _____ sf.
- FocalPoint Bed Area provided * = _____ sf.
- Dimensions of Proposed FocalPoint = _____ft x _____ft

* see criteria 2. to determine if minimum size is appropriate.

2. A 0.95 inch Type III 24hr rainfall event shall be modelled to demonstrate the entire storm volume is treated prior to activation of the overflow (typically set at 6-12" above the mulch)

- Temporary storage depth provided = _____ inches (typ 6" to 12")
- Temporary storage volume provided at above depth = _____ cubic feet.
- Peak ponding depth from 0.95" 24hr storm event = _____ inches

3. Ratio of the surface area of the filter media (sf) to the temporary ponding volume (cf) shall be no less that 1:5

- Ratio of FocalPoint Bed Area : Temporary Storage Vol = _____ : _____

4. Subsurface R-Tank or Chamber Treatment Row must be sized to treat the peak flow from a 1 yr-24hr storm event.

- 1yr 24hr Peak Flowrate = _____ cfs
- Chamber model selected
  - Cultec 330 XLHD (1 chamber per 0.227 cfs) ☐
  - Cultec 150XLHD (1 chamber per 0.185 cfs) ☐
  - R-Tank modules (1 module per 0.02 cfs) ☐

- Number of Chambers/modules required = _____

5. Controlled release of the Channel Protection over 24-48 hrs

- Controlled release of the channel protection volume is being achieved by:
  - Expanded subsurface storage basin with OCS ☐
  - Surface detention basin with OCS ☐

6. A landscape plan for the FocalPoint bed area has been prepared ☐

7. The Design shall be reviewed by the manufacturer's representative prior to submission and installation will be overseen by the manufacturer's representative.

- The Design has been reviewed by ACF Environmental ☐
- Engineer will coordinate installation inspection with ACF ☐

APPENDIX B

Stormwater BMP Inspection and Maintenance

RANSOM Consulting, Inc.

Consulting Engineers and Scientists

Maine Behavioral Healthcare Stormwater Post Construction Stormwater Inspection and Maintenance Plan

Note: This plan addresses Post Construction Inspection and Maintenance only. Inspection and Maintenance during construction can be found in Section 14 with the Sedimentation and Erosion Control Plan

Introduction:

This Post Construction Stormwater Inspection and Maintenance Plan outlines the anticipated inspection and maintenance procedures for the stormwater management devices proposed for the project. These procedures should be followed to ensure the intended function of the designed measures and to prevent unreasonable adverse impacts to the surrounding environment. These procedures are provided as an overview of the anticipated practices to be used on this site. In some instances, additional measures may be required due to unexpected conditions. For additional detail, refer to the most recent edition of the "Maine Stormwater Best Practices Manual (BMPs)" as published by the Maine Department of Environmental Protection (MEDEP)

Inspection and Maintenance Contract:

After construction, it is the responsibility of the owner or assigned heirs to comply with the inspection and maintenance procedures outlined in this section. All measures shall be maintained in good operating condition. A person with knowledge of stormwater control, including the standards and conditions in all applicable permits, shall conduct the inspections.

Long-term inspection and maintenance by a DEP approved stormwater maintenance inspector shall be regularly provided under a five-year binding inspection and maintenance contract that must be renewed prior to contract expiration. A legal agreement shall be established with responsibility for inspection and maintenance and should list specific maintenance responsibilities (including timetables) as well as provide for funding for the long-term inspection and maintenance. As the project moves forward it is anticipated a contract for the provider of these services will be provided.

Parking Lot and Road:

Clear accumulations of winter sand in parking lots and along roadways at least once a year, preferably in the spring. Accumulations on pavement must be removed with pure vacuum, vacuum assist, or

regenerative air. Accumulations of sand along road shoulders may be removed by grading excess sand to the pavement edge and removing it manually or by a front-end loader. Grading of gravel paths, or grading of the gravel shoulders of gravel or paved roads, must be routinely performed to ensure that stormwater drains immediately off the road surface to adjacent BMPs, and is not impeded by accumulations of graded material on the road shoulder or by excavation of false ditches in the shoulder. Snow must be removed from the road and parking lot at a location with a minimum of 25 feet from the wetlands.

Stormwater Management Devices:

During the first year of operation, filtration BMPs shall be inspected twice annually and following major storm events. Thereafter, the filter should be inspected every six months to ensure that it is draining no less than 24 hours and within 48 hours following a 1-inch storm or greater. Additionally, a storm that fills the system to overflow should be monitored to confirm in drains in no less than 36 hours and within 60 hours.

A. MANMADE PERVIOUS SURFACES:

Inspect bi-monthly during the first six months following construction, then inspect annually. Inspections should be made after significant storm events to check for surface ponding that could indicate failure due to clogging. Non-routine maintenance may require reconstruction of the surface treatment, and possibly the filter and reservoir layers, to relieve major clogging.

Maintenance criteria for manmade pervious surfaces are as follows:

- Debris and sediment buildup shall be removed from the paver system using a vac truck as needed and shall be disposed properly.
- Remove sediment when the surface infiltration rates of more than 75% of the surface area fall below 10% of the post-installation verified surface infiltration rate.
- Remove sediment when surface ponding remains for more than 24 hours after the storm event in an area larger than 10 square feet.
- Restrain vehicles with muddy wheels from accessing pervious pavement areas.
- Limit salt use for deicing and do not use sand.
- Remove leaves and organic debris in the fall.
- Sweep, vacuum and/or pressure wash pavement twice annually at a minimum.

B. FOCALPOINTS:

- A first inspection to determine if maintenance is necessary should be performed at least twice annually after storm events of greater than (1) one-inch total depth (subject to regional climate). Please refer to the maintenance checklist for specific conditions that indicate if maintenance is necessary.

- Check for standing water and that the bypass inlet is clear of debris.
- Check embankments for erosion.
- Check outlet control structure for accumulation of sediment.
- Dig out silt (if any) and mulch and remove trash & foreign items.
- After removal of mulch and debris, measure distance from the top of the FocalPoint® HPMBS engineered media soil to the flow line elevation of the adjacent overflow conveyance. If this distance is greater than that specified on the plans (typ. 6" - 12"), add media (not topsoil or other) to recharge to the distance specified.
- Replace mulch when/where necessary.
- Examine the plant's health and replace if dead or dying. Prune as necessary to encourage growth in the correct directions.
- The pond should drain in 24-48 hours. If the pond begins draining at a time approaching or exceeding 48 hours, the filter media must be removed and replaced.

C. R-TANK STORMWATER DETENTION:

Inspection and Maintenance of the R-Tank shall be in accordance with the recommended practices of the manufacture, ACF Environmental, to provide the performance required by the design. The R-Tank system includes inspection ports and maintenance ports, each of which has a cover at the surface. A visual inspection of all ports should be used to determine the depth of sediments deposited in the R-Tank system. The system should be backflushed once the sediment accumulation has reached the manufacturer's limits. Once removed, sediment-laden water must be disposed of properly.

Re-Certification:

Long-term inspection and maintenance by a DEP approved stormwater maintenance inspector shall be regularly provided under a five-year binding inspection and maintenance contract that must be renewed prior to contract expiration. Submit a certification of the following to the MEDEP within three months of the expiration of each five-year interval from the date of issuance of the permit. The form is provided below.

- Identification and repair of erosion problems. Certification that all areas of the development have been inspected for erosion, and appropriate steps have been taken to permanently stabilize these areas.

- Identification and repair of stormwater control system. Certification that all aspects of the stormwater control system have been inspected for damage, wear, and malfunction, and appropriate steps have been taken to repair or replace the failing systems.

- Maintenance. Certification that the erosion control and stormwater maintenance plan for the site is being implemented as written, and a maintenance log has been created and is being maintained.

FIVE-YEAR RECERTIFICATION FOR LONG-TERM MAINTENANCE OF STORMWATER MANAGEMENT SYSTEMS

For Site Location & Stormwater Projects

This form complies with the condition that requires reporting every 5 years on the long-term maintenance of stormwater management structures of projects permitted under the Stormwater Management Law since 2005. Complete the following sections, include appropriate photos if available, and use additional paper if needed. A copy of the report if the inspection was performed by a professional experienced in BMP maintenance should be included. This form is available on the Maine DEP website at: http://www.maine.gov/dep/ODQG/stormwater/stormwaterbmps/

			Please type or print in black ink only

LOCATION OF DEVELOPMENT	
Name of Project:	
Address and Town:	
DEP Permit Number:	

PROJECT SPECIFICS	
If the project is unfinished, please describe its current status and your plans for the future of the development. Filing this report to the Department of on-site long-term maintenance activities is still required.	
If the project is within a MPDES Regulated Town and a maintenance report has been prepared for this project, please attach the existing report.	
If the project is a subdivision with a Homeowner's association, identify the responsible party.	
Confirm that the required recording of deed restrictions for the protection of buffers or conservation land has been done and that the buffers are being maintained in accordance with the restrictions.	
Identify the contractor for the renewed 5-year maintenance contract for the inspection, cleaning and maintenance of manufactured proprietary structures.	
Is a maintenance log available for review?	

LONG-TERM MAINTENANCE (please comment on the following):
All areas of the development have been inspected for erosion, and appropriate steps have been taken to permanently stabilize these areas.
All stormwater control structures have been inspected for damage, wear, malfunction, and appropriate steps have been taken to repair or replace the failing systems
The erosion control and stormwater maintenance plan for the site is being implemented as written, and a maintenance log has been created and is being maintained.

CERTIFICATIONS/SIGNATURES
By signing below. the owner (or authorized agent) certifies that all stormwater management structures at the project described above are stable and operational as designed.
Signed:_____ **Title**_____**Date:**_____
This completed form and all supporting documents summarized above shall be sent to the following address. An emailed report is appropriate and should be sent to kerem.gungor@maine.gov Kerem Gungor, Bureau of Land and Water Quality 17 State House Station Augusta, ME 04333 Tel: (207) 446-3915

MaineHealth – Center of Excellence
City of Portland Construction Management Plan
Amended February 11, 2020

A. Construction Management Principles

Langford and Low understands the requirements of this section and plans to incorporate them into the project.

B. Development Review of Construction Management Plan

Langford and Low understands the requirements of this section and plans to incorporate them into the project

C. Performance Guarantees, Inspection Fees, Construction Management Plan

Langford and Low and its subcontractors will apply for and obtain all required permits including but not limited to:

- Building permit and MEP trade permits
- Utility connection (chapter 24 and 32)
- Street openings and or closing permits (Chapter 25).
- Blasting - Is not anticipated on this project
- Building Code – Best practices will be employed in accordance with chapter 33.

Langford and Low will facilitate a preconstruction meeting following the issuance of the building permit.

D. Construction Administration and Communication

Applicant Contact
Dennis Morelli 207-662-6149

Construction Manager Contact

Project Manager	Jared Ballard 207-317-3187
Site Superintendent	Darren Crawford 207-318-0074

The construction manager will establish a site sign that will include the CM and applicant contact information. These will be removed at the end of the project.

E. Construction Schedule

1. A construction Schedule has been attached to this CM plan.
2. All hours of construction will be in accordance with attachment 1 and 2 in section 25-129 of the permit application.
3. N/A
4. Material delivery areas are defined in the attached CM site plan.

F. Security and Public Safety

1. Fencing, Barriers and Gates have been identified on the CM site management plan.
2. N/A – All construction related to this project is new.
3. Fire Safety –
4. Blasting – Not anticipated on this project.
5. Temp Security Lighting - Not anticipated on this project.

G. Construction Permitting and Traffic Control Plans

1. All construction activity will be licensed and permitted and executed in accordance with Chapter 25 article VII of the City Code of Ordinances.
2. All sewer and stormwater connections will be licensed and permitted and executed in accordance with Chapter 24 and 32 of the City Code of Ordinances.
3. Traffic Control – The site contractor will submit MOT plans prior to undertaking any work in the public street system.

H. Site Management and Controls

1. Trash and debris removal – Will be handled by a wastemen management company specializing in this work. Dumpsters will be located onsite at various locations depending on the state of completion of the project.
2. Street cleaning and damage control – A construction entrance to the site will be constructed in accordance with the city standards. The site contractor will be responsible to maintain the entrance and removal any debris from vehicle tired exiting the site. A street sweeping machine will be located onsite to clean the public street periodically as needed.
3. Dust – Will be managed in accordance with Section 25-129 of the city standards.
4. Noise – Will be managed in accordance with Section 17-18 of the city standards.
5. N/A
6. Snow removal – We do not anticipate any snow removal in the public street to be associated with this project.

I Erosion Control

1. Erosion control measures will be established around the perimeter of the site as shown in the CM plan and in accordance with the drawing C100 attached to the CM plan.
2. It is not anticipated that any existing trees will remain within the work area. All trees will be installed as new near the completion of the project.
3. N/A

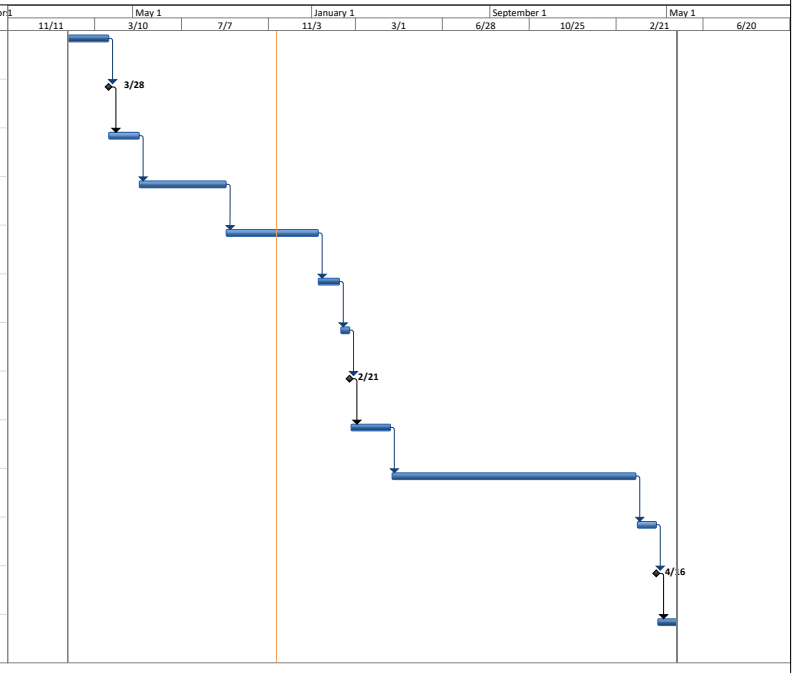
J. Construction Staging Area

1. See attached CM plan for location of material staging areas.
2. See attached CM plan for location of delivery truck holding areas.
3. None anticipated.

K. Parking During Construction

1. There is adequate space within the construction site for construction parking.

L. Dewatering



1. It is not anticipated that significant groundwater will be encountered however, if it is, the goal of the team is to protect adjacent water resources. Should groundwater be encountered during excavation activities the site contractor will employ the following dewatering measures.

    a. Excavate a sump adjacent to the work area deeper than the elevation of the work area.
    b. Place a perforated pipe system encased in crushed stone and lined with filter fabric into the sump.
    c. Pump water from the sump into a silt separation bag sized in accordance with applicable standards. The bag will be located in an approved location and surrounded with appropriate watershed protection measures.

    Should a dewatering condition arise that requires special consideration, the CM will mobilize a storage tank (frac tank) to the site to handle the groundwater while additional dewatering measures are being developed by the engineering and water resource teams.

Plant Notes:

1. The Landscape Contractor is advised that a full set of detailed written landscape specifications and related sections are in Section 329300 of the specification book.
2. The Landscape Contractor is advised of the existence of underground utilities. The Landscape Contractor shall verify utilities prior to commencing construction. Call DIGSAFE at 1-888-344-7233
3. The Landscape Contractor shall be responsible for repairing any utilities, walks, paving, curbing, etc. damaged in the performance of this job at no cost to the Owner. The Landscape Contractor shall notify the Landscape Architect immediately if they encounter any site conditions, which will not allow them to carry out the landscape installation according to the drawings.
4. Planting of trees shall not occur until all erosion control is in place and all grading and paving is completed. All islands and planting areas, shall have 24" of planting soil mix, see specification 329300. 2.5 installed and rolled prior to planting. The finished elevation of the planting soil mix shall be 2" below to the top of the curb or even with adjacent ground. All islands and medians are crowned a minimum of 6" at the center of the island or graded to drain. Submit a sample of the topsoil with NPK, pH, calcium, aluminum effective cation exchange capacity tests and fertility recommendations as well as bulk density test of the sample. Topsoil shall be friable void of weeds, stones greater than 3/4" diametec sticks and other debris. Topsoil shall contain, 70–80% sand, 5-20% clay, 18-20% silt, 5.0-8% organic matter and a pH of 6-6.9. Notify the Landscape Architect immediately if there is standing water or other factors, which would prohibit the installation of plant material.
5. All plants shall have a normal habit of growth for the species and shall be sound, healthy and free of disease and insects. All plants shall be legibly tagged with the proper complete botanical name. They shall conform to the measurements on the Plant List and shall conform to ANSI Z60.1 - Nursery Stock, latest revision. Prior to plant installation, the Landscape Contractor shall submit a written affidavit of all plant species, cultivars, varieties, sizes and quantities that they propose to install with the name, phone number and location of all nurseries where plant material has been grown. All plants shall be grown in a latitude north of Washington D.C. The Landscape Architect will inspect all plants at the place of growth or upon delivery for conformity to the plant list and specifications. Such approval shall not affect the right of inspection and rejection during the progress of work. The Landscape Architect and Owner reserve the right to inspect, select and tag all plant material at the place of growth or select and approve a representative sample of each type of shrub, perennial, groundcover and annual. The samples selected will serve as a minimum standard for all plants of the same species used for this work.
6. The top 1/3 of wire baskets and burlap on trees shall be cut and removed. All other plant material including trees shall have all non-biodegradable materials (string, wire, pots, etc.) removed at the time of planting. Circling roots or roots that would later girdle the plant shall be straightened, cut or the root ball shall be cut utilizing a split ball technique.
7. Backfill mix shall be composed of an 80/20, top soil/ peat moss mix. Planting pits shall be excavated to three times the diameter and to the same depth of the plant root ball. Backfill1/2 of the pit at a time, and compact. See Note 8 and install slow release fertilizer after first backfill lift. Setting the tree/shrub: Each tree/ shrub shall be planted such that the trunk flare junction is level with or 1" above existing grade. All trees/shrubs where the planting depth is incorrect shall be rejected. All trees and shrubs shall have a 3" soil saucer constructed at the perimeter of the planting pit.
8. All plantings shall have slow release fertilizer installed at the time of planting. The fertilizer shall be "Roots Transplant 1 Step", installed/ applied according to manufacturers instructions according to manufacturers instructions. After the plants are installed in each area, liquid feed all plants with Roots – Liquid Concentrate. Mix and apply according to manufacturers instructions. The landscape contractor shall submit samples of the slow release fertilizer and copies of the label of the liquid fertilizer prior to plant installation. The Landscape Contractor shall not install any plant material unless appropriate watering equipment is on site. All plants shall be adequately watered the day of installation or these plants will be rejected and replaced by the Landscape Contractors at no cost to the owner.
9. All trees shall have 2 stakes and guys. Stakes shall be 2" x 2" hardwood of sufficient length to guy above the first branches. Guys shall be flexible guying chain or an approved equal. Submit a sample of guying prior to installation. Any plants with broken or damaged root balls will be rejected. The landscape contractor shall remove all stakes after 1 year.
0. Mulch to be installed to a depth of 3" after normal settling including the seasonal color area. Mulch shall be medium shredded Hemlock bark, dark brown in color. Do not place mulch in contact with the tree trunk. The Landscape Contractor shall submit a .25 cubic foot sample prior to installation.
11. All plants shall have their locations staked and approved by the Landscape Architect prior to plant installation. Plants shall be spaced according to the plan and as noted in the Plant Species List. All plants shall be oriented for best appearance and arranged to evenly occupy the space where they are planted.
12. Plant species and plant size substitutions will not be allowed unless first approved by the Landscape Architect. Any substituted plants installed without prior approval will be rejected.
13. All plants shall be warranted as noted in section 329300: 1.7 in the specifications. The landscape contractor at no cost to the owner shall replace any plants that die during the guarantee.
14. Allow deciduous and evergreen shrubs to grow together to form a continuous plant mass.
15. The contractor shall supply the quantities of plants sufficient to complete the work shown on all of the drawings. If quantities of plants listed in the plant species list do not correlate with the plantings indicated on the drawings, the quantities on the drawings shall govern. Any discrepancies between the plant list and the drawings shall not entitle the landscape contractor to additional remuneration. Notify the Landscape Architect immediately if discrepancies are detected.
16. Under no circumstance shall snow be plowed and piled on planting areas. This will result in crushing and death of the plant material.

EXTERIOR ELEVATIONS

EROSION CONTROL NOTES

EROSION CONTROL MEASURES AND SITE STABILIZATION

THE PRIMARY EMPHASIS OF THE EROSION AND SEDIMENT CONTROL PLAN IS AS FOLLOWS:

- RAPID VEGETATION OF EXPOSED AREAS TO MINIMIZE THE PERIOD OF SOIL EXPOSURE.
- RAPID STABILIZATION OF DRAINAGE PATHS TO AVOID CHANNEL EROSION.
- THE USE OF ON-SITE MEASURES TO CAPTURE SEDIMENT (HAY BALES, STONE CHECK DAMS, SILT FENCE, SILT SAC, PLUNGE POOL, ETC.)
- DEVELOPMENT OF A CAREFUL CONSTRUCTION SEQUENCE.

THE FOLLOWING TEMPORARY AND PERMANENT EROSION AND SEDIMENT CONTROL DEVICES WILL BE IMPLEMENTED AS PART OF THE SITE DEVELOPMENT. THESE DEVICES SHALL BE INSTALLED AS INDICATED ON THE PLANS OR AS DESCRIBED WITHIN THIS REPORT. FOR FURTHER REFERENCE, SEE THE MAINE EROSION AND SEDIMENT CONTROL BMPs, MARCH 2003.

TEMPORARY EROSION CONTROL MEASURES

THE FOLLOWING MEASURES ARE PLANNED AS TEMPORARY EROSION & SEDIMENTATION CONTROL MEASURES DURING CONSTRUCTION. THESE TEMPORARY EROSION CONTROL MEASURES SHOULD BE REMOVED WITHIN 30 DAYS AFTER PERMANENT STABILIZATION HAS BEEN ESTABLISHED.

1. CRUSHED STONE–STABILIZED CONSTRUCTION ENTRANCES SHALL BE PLACED AT SITE ENTRANCES.

2. SILTATION FENCE OR WOOD WASTE COMPOST BERMS (EROSION CONTROL BERM) SHALL BE INSTALLED DOWNSTREAM OF ANY DISTURBED AREAS TO TRAP RUNOFF BORNE SEDIMENTS UNTIL THE TRIBUTARY AREAS ARE VEGETATED. THE SILT FENCE AND/OR THE EROSION CONTROL BERMS SHALL BE INSTALLED PER THE DETAILS PROVIDED AND INSPECTED REGULARLY, INCLUDING BEFORE AND AFTER A STORM EVENT OF 0.5 INCHES OR GREATER. REPAIRS SHALL BE MADE IF THERE ARE ANY SIGNS OF EROSION OR SEDIMENTATION BELOW THE FENCE OR BERM LINE. IF THERE ARE SIGNS OF UNDERCUTTING AT THE CENTER OR THE EDGES, OR IMPOUNDING OF LARGE VOLUMES OF WATER BEHIND FENCE OR BERM, THE BARRIER SHALL BE REPLACED WITH A STONE CHECK DAM.

3. STRAW, HAY MULCH AND HYDROSEEDING IS INTENDED TO PROVIDE COVER FOR BARE OR SEEDED AREAS UNTIL VEGETATION IS ESTABLISHED AND SHOULD BE APPLIED WITHIN 7 DAYS AT A RATE OF 90 POUNDS PER 1,000 SQUARE FEET. MULCH PLACED BETWEEN APRIL 15TH AND SEPEMBER 30TH (ON SLOPES OF LESS THEN 15%) SHALL BE ANCHORED BY APPLYING WATER. MULCH PLACED ON SLOPES OF EQUAL TO OR STEEPER THAN 15% SHALL BE COVERED BY FABRIC NETTING AND ANCHORED WITH STAPLES IN ACCORDANCE WITH MANUFACTURER'S RECOMMENDATION. SLOPES STEEPER THAN 3:1 SHALL RECEIVE EROSION CONTROL BLANKETS.

4. STOCKPILES SHALL BE STABILIZED WITHIN SEVEN DAYS BY EITHER TEMPORARILY SEEDING THE STOCKPILE BY A HYDROSEED METHOD CONTAINING AN EMULSIFIED MULCH TACKIER OR BY COVERING WITH A SUITABLE MULCH, SUCH AS SHREDDED HAY, STRAW, OR EROSION CONTROL MIX. STOCKPILES SHALL BE SURROUNDED BY SEDIMENTATION BARRIERS AT THE TIME OF FORMATION.

5. STATE AND LOCAL ROADS SHALL BE SWEPT TO CONTROL MUD AND DUST AS NECESSARY. ADDITIONAL STONE SHALL BE ADDED TO THE STABILIZED CONSTRUCTION ENTRANCE TO MINIMIZE THE TRACKING OF MATERIAL OFF THE SITE AND ONTO THE SURROUNDING ROADWAYS.

6. DURING GRUBBING OPERATIONS STONE CHECK DAMS SHALL BE INSTALLED AT ANY EVIDENT CONCENTRATED FLOW DISCHARGE POINTS AND AS DIRECTED ON THE EROSION CONTROL PLANS.

7. SILT FENCE HAS A MINIMUM STAKE SPACING OF 6 FEET, UNLESS THE FENCE IS SUPPORTED BY WIRE FENCE REINFORCEMENT (MINIMUM 14 GAUGE AND WITH A MAXIMUM MESH SPACING OF 6 INCHES), IN WHICH CASE STAKES MAY BE SPACED A MAXIMUM OF 10 FEET APART. THE BOTTOM OF THE FENCE MUST BE ANCHORED. SEE DETAIL ON PLAN SET.

8. STORM DRAIN CATCH BASIN INLET PROTECTION SHALL BE PROVIDED THROUGH THE USE OF STONE SEDIMENT BARRIERS OR APPROVED SEDIMENT BAGS (SUCH AS SILT SACK). INSTALLATION DETAILS ARE PROVIDED IN THE PLAN SET. THE BARRIERS SHALL BE INSPECTED AFTER EACH RAINFALL AND REPAIRS MADE AS NECESSARY. SEDIMENT SHALL BE REMOVED AND THE BARRIER RESTORED TO ITS ORIGINAL DIMENSIONS WHEN THE SEDIMENT HAS ACCUMULATED TO HALF THE DESIGN DEPTH OF THE BARRIER. THE BARRIER SHALL BE REMOVED WHEN THE TRIBUTARY DRAINAGE AREA HAS BEEN STABILIZED.

9. WATER AND/OR CALCIUM CHLORIDE SHALL BE FURNISHED AND APPLIED IN ACCORDANCE WITH MDOT SPECIFICATIONS–SECTION 637–DUST CONTROL.

10. LOAM AND SEED IS INTENDED TO SERVE AS THE PRIMARY PERMANENT VEGETATIVE MEASURE FOR ALL BARE AREAS NOT PROVIDED WITH OTHER EROSION CONTROL MEASURES, SUCH AS RIPRAP.

11. WATER FROM CONSTRUCTION TRENCH DEWATERING OR TEMPORARY STREAM DIVERSION SHALL PASS FIRST THROUGH A FILTER BAG OR SECONDARY CONTAINMENT STRUCTURE (e.g. HAYBALE LINED POOL) PRIOR TO DISCHARGE. THE DISCHARGE SITE SHALL BE SELECTED TO AVOID FLOODING, ICING AND SEDIMENT DISCHARGES TO A PROTECTED RESOURCE. IN NO CASE SHALL THE FILTER BAG OR CONTAINMENT STRUCTURE BE LOCATED WITHIN 75 FEET OF A PROTECTED NATURAL RESOURCE.

PERMANENT EROSION CONTROL MEASURES

THE FOLLOWING PERMANENT EROSION CONTROL MEASURES HAVE BEEN DESIGNED AS PART OF THE EROSION/SEDIMENTATION CONTROL PLAN:

12. ALL AREAS DISTURBED DURING CONSTRUCTION, BUT NOT SUBJECT TO OTHER RESTORATION (PAVING, RIPRAP, ETC.) WILL BE LOAMED, LIMED, FERTILIZED, MULCHED AND SEEDED. ALL EXPOSED SOIL WHICH WILL REMAIN FOR 1 YEAR AFTER COMPLETION OF CONSTRUCTION SHALL BE MULCHED USING EROSION CONTROL MIX AS SPECIFIED IN MAINE DOT SECTION 619 OR SHALL BE LOAMED AND SEEDED.

13. CATCH BASINS SHALL BE PROVIDED WITH SEDIMENT SUMPS AND INLET HOODS FOR ALL OUTLET PIPES THAT ARE 18" IN DIAMETER OR LESS.

IMPLEMENTATION SCHEDULE

THE FOLLOWING CONSTRUCTION SEQUENCE SHALL BE REQUIRED TO INSURE THE EFFECTIVENESS OF THE EROSION AND SEDIMENTATION CONTROL MEASURES ARE OPTIMIZED:
NOTE: FOR ALL GRADING ACTIVITIES, THE CONTRACTOR SHALL EXERCISE EXTREME CAUTION NOT TO OVEREXPOSE THE SITE BY LIMITING THE DISTURBED AREA. THE CONSTRUCTION OF BMPs SHOULD EITHER BE PERFORMED AFTER THE TRIBUTARY AREA IS STABILIZED OR TEMPORARY EROSION CONTROL MEASURES NEED TO BE IMPLEMENTED TO PROTECT THE BMPs FROM BEING CLOGGED WITH CONSTRUCTION SEDIMENT.

14. INSTALL CRUSHED STONE TO STABILIZED CONSTRUCTION ENTRANCES.

15. INSTALL PERIMETER SILT FENCE.

16. CLEAR AND GRUB SITE WITHIN THE SPECIFIED CLEARING LIMITS.

17. COMMENCE INSTALLATION OF DRAINAGE INFRASTRUCTURE.

18. COMMENCE EARTHWORK AND GRADING TO SUBGRADE.

19. COMMENCE STORM WATER BMPs CONSTRUCTION.

20. COMMENCE INSTALLATION OF ELECTRICAL SERVICE.

21. COMMENCE INSTALLATION OF WATER AND SEWER INFRASTRUCTURE.

22. CONTINUE EARTHWORK AND GRADING TO SUBGRADE AS NECESSARY FOR CONSTRUCTION.

23. COMPLETE INSTALLATION OF UNDERGROUND UTILITIES TO WITHIN 5' OF THE BUILDINGS.

24. INSTALL LIGHT POLE FOUNDATIONS AND UTILITY POLES.

25. COMPLETE REMAINING EARTHWORK OPERATIONS.

26. COMPLETE INSTALLATION OF DRAINAGE INFRASTRUCTURE.

27. INSTALL SUBBASE AND BASE GRAVEL WITHIN PROPOSED ROADWAYS AND PARKING LOTS.

28. INSTALL CURBING AS NEEDED/REQUIRED.

29. INSTALL BASE COURSE PAVING FOR ACCESS DRIVE AND PARKING AREA AS WELL AS CONCRETE SURFACES.

30. LOAM, LIME, FERTILIZE, SEED AND MULCH DISTURBED AREAS AND COMPLETE ALL LANDSCAPING.

31. INSTALL SURFACE COURSE PAVING FOR ACCESS DRIVE AND PARKING AREAS.

32. ONCE THE SITE IS STABILIZED AND A 90% CATCH OF VEGETATION HAS BEEN OBTAINED, REMOVE ALL TEMPORARY EROSION CONTROL MEASURES.

IMPLEMENTATION SCHEDULE (CONTINUED)

33. TOUCH UP LOAM AND SEED.

NOTE: ALL BARE AREAS NOT SUBJECT TO FINAL PAVING, RIPRAP OR GRAVEL, SHALL BE VEGETATED.

PRIOR TO CONSTRUCTION OF THE PROJECT, THE CONTRACTOR SHALL SUBMIT TO THE OWNER A SCHEDULE FOR THE COMPLETION OF THE WORK, WHICH WILL SATISFY THE ABOVE CONSTRUCTION SEQUENCE IN THE SPECIFIED ORDER. HOWEVER, SEVERAL SEPARATE ITEMS MAY BE CONSTRUCTED SIMULTANEOUSLY. WORK MUST ALSO BE SCHEDULED OR PHASED TO REDUCE THE EXTENT OF THE EXPOSED AREAS AS SPECIFIED BELOW. THE INTENT OF THIS SEQUENCE IS TO PROVIDE FOR EROSION CONTROL AND TO HAVE STRUCTURAL MEASURES SUCH AS SILT FENCE AND CONSTRUCTION ENTRANCES IN PLACE BEFORE LARGE AREAS OF LAND ARE STRIPPED.

EROSION, SEDIMENTATION AND STABILIZATION CONTROL PLAN

THE EROSION CONTROL PLAN IS INCLUDED IN THE PLAN SET.

WINTER STABILIZATION PLAN

THE WINTER CONSTRUCTION PERIOD IS FROM NOVEMBER 1 THROUGH APRIL 15. IF THE CONSTRUCTION SITE IS NOT STABILIZED WITH PAVEMENT, A ROAD GRAVEL BASE, 75% MATURE VEGETATION COVER OR RIPRAP BY NOVEMBER 15TH, THEN THE SITE SHALL BE PROTECTED WITH OVER–WINTER STABILIZATION.

WINTER EXCAVATION AND EARTHWORK SHALL BE COMPLETED SUCH THAT ANY AREAS LEFT EXPOSED CAN BE CONTROLLED BY THE CONTRACTOR. EXPOSED AREAS SHALL BE LIMITED TO THOSE AREAS IN WHICH WORK IS EXPECTED TO COMMENCE AND COMPLETE IN THE NEXT FIFTEEN (15) DAYS AND THAT CAN BE MULCHED WITHIN ONE DAY PRIOR TO ANY SNOW EVENT.

ALL AREAS SHALL BE CONSIDERED TO BE BARE UNTIL THE SUBBASE GRAVEL IS INSTALLED WITHIN PAVEMENT/BUILDING AREAS OR THE AREAS HAVE BEEN LOAMED, SEEDED AND MULCHED. HAY AND STRAW MULCH RATE SHALL BE A MINIMUM OF 150 POUNDS PER 1,000 SQUARE FEET (3 TONS/ACRE) AND SHALL BE PROPERLY ANCHORED.

THE CONTRACTOR SHALL INSTALL ANY ADDED MEASURES, WHICH MAY BE NECESSARY TO CONTROL EROSION/SEDIMENTATION FROM THE SITE DEPENDENT UPON THE ACTUAL SITE AND WEATHER CONDITIONS. CONTINUATION OF EARTHWORK OPERATIONS ON ADDITIONAL AREAS SHALL NOT BEGIN UNTIL THE EXPOSED SOIL SURFACE OF THE AREA BEING WORKED HAS BEEN STABILIZED, IN ORDER TO MINIMIZE AREAS WITHOUT EROSION CONTROL PROTECTION.

34. SOIL STOCKPILES
STOCKPILES OF SOIL OR SUBSOIL SHALL BE MULCHED FOR OVER WINTER PROTECTION WITH HAY OR STRAW AT TWICE THE NORMAL RATE (NO 150 LBS./1,000 SF (3 TONS PER ACRE) OR WITH A FOUR–INCH LAYER OF WOODWASTE EROSION CONTROL MIX. THIS SHALL BE DONE WITHIN 24 HOURS OF STOCKING AND RE–ESTABLISHED PRIOR TO ANY RAINFALL OR SNOWFALL. ANY SOIL STOCKPILE SHALL NOT BE PLACED (EVEN COVERED WITH HAY OR STRAW) WITHIN 100 FEET FROM ANY NATURAL RESOURCES.

35. NATURAL RESOURCE PROTECTION
ANY AREAS WITHIN 75 FEET FROM ANY NATURAL RESOURCES, IF NOT STABILIZED WITH A MINIMUM OF 90% MATURE VEGETATION CATCH, SHALL BE MULCHED BY DECEMBER 1ST AND ANCHORED WITH PLASTIC NETTING OR PROTECTED WITH EROSION CONTROL MATS. DURING WINTER CONSTRUCTION, A DOUBLE LINE OF SEDIMENT BARRIERS (I.E. SILT FENCE BUCKED WITH HAY BALES OR EROSION CONTROL MIX) SHALL BE PLACED BETWEEN ANY NATURAL RESOURCE AND THE DISTURBED AREA. PROJECTS CROSSING THE NATURAL RESOURCE SHALL BE PROTECTED A MINIMUM DISTANCE OF 75 FEET ON EITHER SIDE FROM THE RESOURCE. EXISTING PROJECTS NOT STABILIZED BY DECEMBER 1ST SHALL BE PROTECTED WITH THE SECOND LINE OF SEDIMENT BARRIER TO ENSURE FUNCTIONALITY DURING THE SPRING THAW AND RAINS.

36. SEDIMENT BARRIERS
DURING FROZEN CONDITIONS, SEDIMENT BARRIERS SHALL CONSIST OF WOODWASTE FILTER BERMS AS FROZEN SOIL PREVENTS THE PROPER INSTALLATION OF HAY BALES AND SEDIMENT SILT FENCES.

37. MULCHING
AN AREA SHALL BE CONSIDERED BARE UNTIL AREAS OF FUTURE LOAM AND SEED HAVE BEEN LOAMED, SEEDED AND MULCHED. HAY AND STRAW MULCH SHALL BE APPLIED AT A RATE OF 150 LBS. PER 1,000 SQUARE FEET OR 3 TONS/ACRE (TWICE THE NORMAL ACCEPTED RATE OF 75 LBS. PER 1,000 S.F. OR 1.5 TONS/ACRE) AND SHALL BE PROPERLY ANCHORED. MULCH SHALL NOT BE SPREAD ON TOP OF SNOW. THE SNOW SHALL BE REMOVED DOWN TO A ONE INCH DEPTH OR LESS PRIOR TO APPLICATION. AFTER EACH DAY OF FINAL GRADING, THE AREA SHALL BE PROPERLY STABILIZED WITH ANCHORED HAY OR STRAW OR EROSION CONTROL MATTING. AN AREA SHALL BE CONSIDERED TO HAVE BEEN EITHER MULCHED WITH STRAW OR HAY AT A RATE OF 150 LBS. PER 1,000 S.F. (3 TONS/ACRE) AND ADEQUATELY ANCHORED THAT GROUND SURFACE IS NOT VISIBLE THROUGH THE MULCH.

BETWEEN THE DATES OF NOVEMBER 1ST AND APRIL 15TH ALL MULCH SHALL BE ANCHORED BY PEG LINE, MULCH NETTING, TRACKING OR WOOD CELLULOSE FIBER. WHEN GROUND SURFACE IS NOT VISIBLE THROUGH THE MULCH THEN COVER IS SUFFICIENT. AFTER NOVEMBER 1ST, MULCH AND ANCHORING OF ALL BARE SOIL SHALL OCCUR AT THE END OF EACH FINAL GRADING WORKDAY.

38. MULCHING ON SLOPES AND DITCHES
SLOPES SHALL NOT BE LEFT EXPOSED FOR ANY EXTENDED TIME OF WORK SUSPENSION UNLESS FULLY MULCHED AND ANCHORED WITH PEG AND NETTING OR WITH EROSION CONTROL BLANKETS. MULCHING SHALL BE APPLIED AT A RATE OF 230 LBS./1,000 S.F. ON ALL SLOPES GREATER THAN 8%.

MULCH NETTING SHALL BE USED TO ANCHOR MULCH IN ALL DRAINAGE WAYS WITH A SLOPE GREATER THAN 3% FOR SLOPES EXPOSED TO DIRECT WINDS AND FOR ALL OTHER SLOPES GREATER THAN 8%. EROSION CONTROL BLANKETS SHALL BE USED IN LIEU OF MULCH IN ALL DRAINAGE WAYS WITH SLOPES GREATER THAN 8%. EROSION CONTROL MIX CAN BE USED TO SUBSTITUTE EROSION CONTROL BLANKETS ON ALL SLOPES EXCEPT DITCHES.

39. SEEDING
BETWEEN THE DATES OF OCTOBER 15TH AND APRIL 1ST, LOAM OR SEED WILL NOT BE REQUIRED. DURING PERIODS OF ABOVE FREEZING TEMPERATURES, FINISHED AREAS SHALL BE FINE GRADED AND EITHER PROTECTED WITH MULCH OR TEMPORARILY SEEDED AND MULCHED UNTIL SUCH TIME AS THE FINAL TREATMENT CAN BE APPLIED. IF THE DATE IS AFTER NOVEMBER 1ST AND IF THE EXPOSED AREA HAS BEEN LOAMED, FINAL GRADED WITH A UNIFORM SURFACE, THEN THE AREA MAY BE DORMANT SEEDED AT A RATE OF THREE TIMES HIGHER THAN SPECIFIED FOR PERMANENT SEED AND THEN MULCHED. DORMANT SEEDING MAY BE SELECTED TO BE PLACED PRIOR TO THE PLACEMENT OF MULCH AND FABRIC NETTING ANCHORED WITH STAPLES. IF DORMANT SEEDING IS USED FOR THE SITE, ALL DISTURBED AREAS SHALL RECEIVE 4" OF LOAM AND SEED AT AN APPLICATION RATE OF 5 LBS./1,000 S.F.

ALL AREAS SEEDED DURING THE WINTER SHALL BE INSPECTED IN THE SPRING FOR ADEQUATE CATCH. ALL AREAS INSUFFICIENTLY VEGETATED (LESS THAN 90% CATCH) SHALL BE REVEGETATED BY REPLACING LOAM, SEED AND MULCH. IF DORMANT SEEDING IS NOT USED FOR THE SITE, ALL DISTURBED AREAS SHALL BE REVEGETATED IN THE SPRING.

40. DEWATERING AND TEMPORARY STREAM DIVERSION
WATER FROM CONSTRUCTION TRENCH DEWATERING OR TEMPORARY STREAM DIVERSION SHALL PASS FIRST THROUGH A FILTER BAG OR SECONDARY CONTAINMENT STRUCTURE (E.G. HAY BALE LINED POOL) PRIOR TO DISCHARGE. THE DISCHARGE SITE SHALL BE SELECTED TO AVOID FLOODING, ICING AND SEDIMENT DISCHARGES TO A PROTECTED RESOURCE. IN NO CASE SHALL THE FILTER BAG OF CONTAINMENT STRUCTURE BE LOCATED WITHIN 75 FEET OF A PROTECTED NATURAL RESOURCE.

41. INSPECTION AND MONITORING
MAINTENANCE MEASURES SHALL BE APPLIED AS NEEDED DURING THE ENTIRE CONSTRUCTION SEASON. AFTER EACH RAINFALL, SNOW STORM OR PERIOD OF THAWING AND RUNOFF, THE SITE CONTRACTOR SHALL PERFORM A VISUAL INSPECTION OF ALL INSTALLED EROSION CONTROL MEASURES AND PERFORM REPAIRS AS NEEDED TO INSURE THEIR CONTINUOUS FUNCTION. FOLLOWING THE TEMPORARY AND/OR FINAL SEEDING AND MULCHING, THE CONTRACTOR SHALL IN THE SPRING INSPECT AND REPAIR ANY DAMAGES AND/OR UNESTABLISHED SPOTS. ESTABLISHED VEGETATIVE COVER MEANS A MINIMUM OF 85% TO 90% OF AREAS VEGETATED WITH VIGOROUS GROWTH.

STANDARDS FOR TIMELY STABILIZATION OF CONSTRUCTION SITES DURING WINTER

1. STANDARD FOR THE TIMELY STABILIZATION OF DISTURBED SLOPES. THE APPLICANT SHALL CONSTRUCT AND STABILIZE STONE–COVERED SLOPES BY NOVEMBER 15TH. THE APPLICANT SHALL SEED AND MULCH ALL SLOPES TO BE VEGETATED BY SEPTEMBER 1ST. THE DEPARTMENT SHALL CONSIDER ANY AREA HAVING A GRADE GREATER THAN 15% TO BE A SLOPE. IF THE APPLICANT FAILS TO STABILIZE ANY SLOPE TO BE VEGETATED BY SEPTEMBER 1ST, THEN THE APPLICANT SHALL TAKE ONE OF THE FOLLOWING ACTIONS TO STABILIZE THE SLOPE FOR LATE FALL AND WINTER.

   STABILIZE THE SOIL WITH TEMPORARY VEGETATION AND EROSION CONTROL MATS—BY OCTOBER 1ST, THE APPLICANT SHALL SEED THE DISTURBED SLOPE WITH WINTER RYE AT A SEEDING RATE OF 3 LBS./1,000 S.F. AND APPLY EROSION CONTROL MATS OVER THE MULCHED SLOPE. THE APPLICANT SHALL MONITOR GROWTH OF THE RYE OVER THE NEXT 30 DAYS. IF THE RYE FAILS TO GROW AT LEAST THREE INCHES OR COVER AT LEAST 75% OF THE DISTURBED SLOPE BY NOVEMBER 1ST, THEN THE APPLICANT SHALL COVER THE SLOPE WITH A LAYER OF WOODWASTE COMPOST OR WITH STONE RIPRAP.

   STABILIZE THE SLOPE WITH SOD—THE APPLICANT SHALL STABILIZE THE DISTURBED SLOPE WITH PROPERLY INSTALLED SOD BY OCTOBER 1ST. PROPER INSTALLATION INCLUDES THE APPLICANT PINNING THE SOD ONTO THE SLOPE WITH WIRE PINS, ROLLING THE SOD TO GUARANTEE CONTACT BETWEEN THE SOD AND UNDERLYING SOIL, AND WATERING THE SOD TO PROMOTE ROOT GROWTH INTO THE DISTURBED SOIL. THE APPLICANT SHALL NOT USE LATE–SEASON SOD INSTALLATION TO STABILIZE SLOPES HAVING A GRADE GREATER THAN 33%.

   STABILIZE THE SLOPE WITH WOODWASTE COMPOST—THE APPLICANT SHALL PLACE A SIX–INCH LAYER OF WOODWASTE COMPOST ON THE SLOPE BY NOVEMBER 15TH. PRIOR TO PLACING THE WOODWASTE COMPOST, THE APPLICANT SHALL REMOVE ANY SNOW ACCUMULATION ON THE DISTURBED SLOPE. THE APPLICANT SHALL NOT USE WOODWASTE COMPOST TO STABILIZE SLOPES HAVING GRADES GREATER THAN 50% OR HAVING GROUNDWATER SEEPS ON THE SLOPE FACE.

   STABILIZE THE SLOPE WITH STONE RIPRAP—THE APPLICANT SHALL PLACE A LAYER OF STONE RIPRAP ON THE SLOPE BY NOVEMBER 1ST. THE APPLICANT SHALL HIRE A REGISTERED PROFESSIONAL ENGINEER TO DETERMINE THE STONE SIZE NEEDED FOR STABILITY AND TO DESIGN A FILTER LAYER FOR UNDERNEATH THE RIPRAP.

2. STANDARD FOR THE TIMELY STABILIZATION OF DISTURBED SOILS BY SEPTEMBER 15TH THE APPLICANT SHALL SEED AND MULCH ALL DISTURBED SOILS ON AREAS HAVING A SLOPE LESS THAN 15%. IF THE APPLICANT FAILS TO STABILIZE THESE SOILS BY THIS DATE, THEN THE APPLICANT SHALL TAKE ONE OF THE FOLLOWING ACTIONS TO STABILIZE THE SOIL FOR LATE FALL AND WINTER.

   STABILIZE THE SOIL WITH TEMPORARY VEGETATION—BY OCTOBER 1ST THE APPLICANT SHALL SEED THE DISTURBED SOIL WITH WINTER RYE AT A SEEDING RATE OF 3 LBS./1,00 S.F., LIGHTLY MULCH THE SEEDED SOIL WITH HAY OR STRAW AT 75 LBS./1,000 S.F., AND ANCHOR THE MULCH WITH PLASTIC NETTING. THE APPLICANT SHALL MONITOR GROWTH OF THE RYE OVER THE NEXT 30 DAYS. IF THE RYE FAILS TO GROW AT LEAST THREE INCHES OR COVER AT LEAST 75% OF THE DISTURBED SOIL BEFORE NOVEMBER 15TH, THEN THE APPLICANT SHALL MULCH THE AREA FOR OVER–WINTER PROTECTION AS DESCRIBED ABOVE.

   STABILIZE THE SLOPE WITH SOD—THE APPLICANT SHALL STABILIZE THE DISTURBED SLOPE WITH PROPERLY INSTALLED SOD BY OCTOBER 1ST. PROPER INSTALLATION INCLUDES THE APPLICANT PINNING THE SOD ONTO THE SLOPE WITH WIRE PINS, ROLLING THE SOD TO GUARANTEE CONTACT BETWEEN THE SOD AND UNDERLYING SOIL, AND WATERING THE SOD TO PROMOTE ROOT GROWTH INTO THE DISTURBED SOIL. THE APPLICANT SHALL NOT USE LATE–SEASON SOD INSTALLATION TO STABILIZE SLOPES HAVING A GRADE GREATER THAN 33%.

   STABILIZE THE SLOPE WITH WOODWASTE COMPOST—THE APPLICANT SHALL PLACE A SIX–INCH LAYER OF WOODWASTE COMPOST ON THE SLOPE BY NOVEMBER 15TH. PRIOR TO PLACING THE WOODWASTE COMPOST, THE APPLICANT SHALL REMOVE ANY SNOW ACCUMULATION ON THE DISTURBED SLOPE. THE APPLICANT SHALL NOT USE WOODWASTE COMPOST TO STABILIZE SLOPES HAVING GRADES GREATER THAN 50% OR HAVING GROUNDWATER SEEPS ON THE SLOPE FACE.

   STABILIZE THE SLOPE WITH STONE RIPRAP—THE APPLICANT SHALL PLACE A LAYER OF STONE RIPRAP ON THE SLOPE BY NOVEMBER 1ST. THE APPLICANT SHALL HIRE A REGISTERED PROFESSIONAL ENGINEER TO DETERMINE THE STONE SIZE NEEDED FOR STABILITY AND TO DESIGN A FILTER LAYER FOR UNDERNEATH THE RIPRAP.

MAINTENANCE OF FACILITIES

THE STORM WATER FACILITIES WILL BE MAINTAINED BY THE APPLICANT. THE CONTRACT DOCUMENTS WILL REQUIRE THE CONTRACTOR TO DESIGNATE A PERSON RESPONSIBLE FOR MAINTENANCE OF THE SEDIMENTATION CONTROL FEATURES DURING CONSTRUCTION AS REQUIRED BY THE EROSION CONTROL REPORT AND/OR CONSTRUCTION PLANS. LONG–TERM OPERATION/MAINTENANCE RECOMMENDED FOR THE STORM WATER FACILITIES IS PRESENTED BELOW AND SHOULD BE RECERTIFIED EVERY FIVE YEARS.

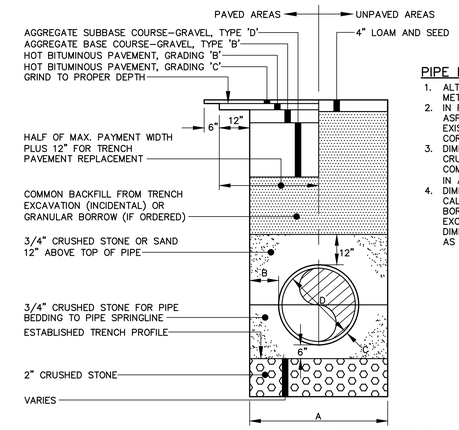
THE RESPONSIBLE PARTY MAY CONTRACT WITH SUCH PROFESSIONALS, AS MAY BE NECESSARY IN ORDER TO COMPLY WITH THIS PROVISION AND MAY RELY ON THE ADVICE OF SUCH PROFESSIONALS IN CARRYING OUT ITS DUTY HERE UNDER, PROVIDED THAT THE FOLLOWING OPERATION AND MAINTENANCE PROCEDURES ARE HEREBY ESTABLISHED AS A MINIMUM FOR COMPLIANCE WITH THIS SECTION.

INSPECTION AND MAINTENANCE FREQUENCY AND CORRECTIVE MEASURES: THE FOLLOWING AREAS, FACILITIES AND MEASURES WILL BE INSPECTED AND THE IDENTIFIED DEFICIENCIES WILL BE CORRECTED. CLEAN–OUT MUST INCLUDE THE REMOVAL AND LEGAL DISPOSAL OF ANY ACCUMULATED SEDIMENTS AND DEBRIS.

CATCH BASINS:
INSPECT CATCH BASINS TWO TIMES PER YEAR (PREFERABLY IN SPRING AND FALL) TO ENSURE THAT THE CATCH BASINS ARE WORKING IN THEIR INTENDED FASHION AND THAT THEY ARE FREE OF DEBRIS. CLEAN STRUCTURES WHEN SEDIMENT DEPTHS REACH 12" FROM INVERT OF OUTLET. IF THE BASIN OUTLET IS DESIGNED WITH A HOOD TO TRAP FLOATABLE MATERIALS (I.E. SNOUT) CHECK TO ENSURE WATERTIGHT SEAL IS WORKING. AT A MINIMUM, REMOVE FLOATING DEBRIS AND HYDROCARBONS AT THE TIME OF THE INSPECTION.

VEGETATED AREAS:
INSPECT SLOPES AND EMBANKMENT EARLY IN THE GROWING SEASON TO IDENTIFY ACTIVE OR POTENTIAL EROSION PROBLEMS. REPLANT BARE AREAS OR AREAS WITH SPARSE GROWTH. WHERE EROSION IS EVIDENT, ARMOR THE AREA WITH AN APPROPRIATE LINING OR DIVERT THE EROSIVE FLOWS TO ON–SITE AREAS ABLE TO WITHSTAND THE CONCENTRATED FLOWS. THE FACILITIES WILL BE INSPECTED AFTER MAJOR STORMS AND ANY IDENTIFIED DEFICIENCIES WILL BE CORRECTED.

DITCHES, SWALES AND OTHER OPEN STORM WATER CHANNELS: INSPECT TWO TIMES PER YEAR (PREFERABLY IN SPRING AND FALL) TO ENSURE THEY ARE WORKING IN THEIR INTENDED FASHION AND THAT THEY ARE FREE OF SEDIMENT AND DEBRIS. REMOVE ANY OBSTRUCTIONS TO FLOW, INCLUDING ACCUMULATED SEDIMENTS, DEBRIS AND VEGETATED GROWTH. REPAIR ANY EROSION OF THE DITCH LINING.



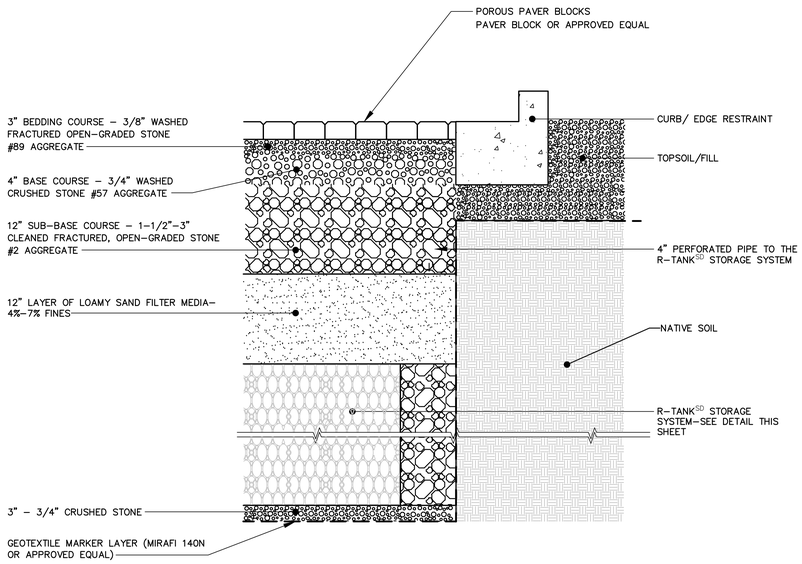
VEGETATED DITCHES WILL BE MOWED AT LEAST ANNUALLY OR OTHERWISE MAINTAINED TO CONTROL THE GROWTH OF WOODY VEGETATION AND MAINTAIN FLOW CAPACITY. ANY WOODY VEGETATION GROWING THROUGH RIPRAP LININGS MUST ALSO BE REMOVED. REPAIR ANY SLUMPING SIDE SLOPES AS SOON AS PRACTICABLE. IF THE DITCH HAS A RIPRAP LINING, REPLACE RIPRAP ON AREAS WHERE ANY UNDERLYING FILTER FABRIC OR UNDERDRAIN GRAVEL IS SHOWING THROUGH THE STONE OR WHERE STONES HAVE DISLODGED. CORRECT ANY EROSION OF THE CHANNEL'S BOTTOM OR SIDESLOPES. THE FACILITIES SHOULD BE INSPECTED AFTER MAJOR STORMS AND ANY IDENTIFIED DEFICIENCIES WILL BE CORRECTED.

ROADWAYS AND PARKING SURFACES:
CLEAR ACCUMULATIONS OF WINTER SAND IN PARKING LOTS AND ALONG ROADWAYS AT LEAST ONCE A YEAR, PREFERABLY IN THE SPRING. ACCUMULATIONS ON PAVEMENT MAY BE REMOVED BY PAVEMENT SWEEPING. ACCUMULATIONS OF SAND ALONG ROAD SHOULDERS MAY BE REMOVED BY GRADING EXCESS SAND TO THE PAVEMENT EDGE AND REMOVING IT MANUALLY OR BY A FRONT–END LOADER.

CONSTRUCTION NOTES

SUBGRADE PREPARATION

1. SUBGRADE PREPARATION IN SHOULD BE IN ACCORDANCE WITH GEOTECHNICAL ENGINEER RECOMMENDATIONS FOUND IN THE GEOTECHNICAL REPORT BY HALEY AND ALDRICH, INC. DATED MAY 16, 2007.
2. EXCAVATE THE FULL THICKNESS OF FILL MATERIALS BELOW THE BUILDING FOOTPRINT (AND FOUNDATION BEARING ZONES) AND REPLACE WITH COMPACTED GRANULAR FILL. SUITABLE FOUNDATION SUBGRADES INCLUDE UNDISTURBED NATIVE SOILS OR COMPACTED GRANULAR FILL PLACED ABOVE UNDISTURBED NATIVE SOILS. IN GENERAL, REMOVAL OF UNSUITABLE SOILS FROM THE PROPOSED BUILDING FOOTPRINT AND FOUNDATION BEARING ZONES SHOULD BE ANTICIPATED TO DEPTHS OF APPROXIMATELY 1 TO 3 FEET. GREATER DEPTHS OF OVER–EXCAVATION MAY BE REQUIRED IN LOCALIZED AREAS TO COMPLETELY REMOVE UNSUITABLE SOILS FROM THESE AREAS. REMOVAL OF UNSUITABLE SOILS SHOULD BE OBSERVED BY THE PROJECT GEOTECHNICAL ENGINEER PRIOR TO BACKFILLING WITH COMPACTED STRUCTURAL FILL
3. ALL TOPSOIL, PAVEMENTS, DEBRIS, FROZEN SOILS, AND LOOSE OR DISTURBED SOILS SHOULD BE REMOVED FROM AREAS RECEIVING NEW CONSTRUCTION.
4. EXISTING FOUNDATIONS, SLABS, AND/OR UTILITIES ASSOCIATED WITH FORMER SITE BUILDINGS AND ANY PAST USES, IF ENCOUNTERED, SHOULD BE REMOVED FROM BELOW THE PROPOSED BUILDING FOOTPRINT. THESE MATERIALS SHOULD BE COMPLETELY REMOVED FROM FOUNDATION BEARING ZONES AND REPLACED WITH COMPACTED GRANULAR FILL.
5. UNDERGROUND STRUCTURES AND UNDERGROUND PIPING, LOCATED BENEATH THE PROPOSED PAVEMENTS OR LANDSCAPED AREAS SHOULD BE REMOVED TO AT LEAST 2 FEET BELOW PROPOSED FINISHED GRADE.
6. THE ENDS OF UNDERGROUND PIPES AND UTILITY CONDUITS TO BE ABANDONED IN–PLACE SHOULD BE CAPPED AND/OR FILLED WITH CONCRETE OR GROUTED.
7. ANY UNSTABLE AREAS IDENTIFIED SHOULD BE UNDERCUT AT LEAST 12 INCHES, OR TO COMPETENT SOIL, AND REPLACED WITH COMPACTED STRUCTURAL FILL, CRUSHED STONE, OR COMMON FILL. THE DEPTH OF UNDERCUTTING AND TYPE OF BACKFILL MATERIAL SHOULD BE SELECTED WITH CONSIDERATION OF PROPOSED USE (I.E., BUILDING OR PAVEMENT) AND SOIL AND WEATHER CONDITIONS ENCOUNTERED DURING CONSTRUCTION.
8. FINAL FOUNDATION AND FLOOR SLAB SUBGRADE PREPARATION SHOULD INCLUDE RE–COMPACTION OF BEARING SURFACES. CARE SHOULD BE TAKEN TO LIMIT DISTURBANCE TO BEARING SURFACES PR



TYPICAL PIPE TRENCH INSTALLATION (WITHIN CITY RIGHT-OF-WAY)

1 NOT TO SCALE

PIPE INSTALLATION NOTES

1. ALTERNATE CONSTRUCTION METHODS OR PAYMENT METHODS SHALL BE APPROVED BY THE CITY.
2. IN PAVED AREAS, DEPTHS OF GRAVEL AND HOT MIX ASPHALT PAVEMENT SHALL MATCH THE GREATER OF EXISTING CONDITIONS OR THE REQUIREMENTS FOR THE CORRESPONDING STREET CLASSIFICATION.
3. DIMENSION B SHALL BE SUFFICIENT TO ALLOW CRUSHED STONE BEDDING TO BE PLACED AND COMPACTED UNDER THE HAUNCHES OF THE PIPE; BUT IN ALL CASES DIMENSION B SHALL BE AT LEAST 9".
4. DIMENSION A IS THE MAXIMUM WIDTH ALLOWED FOR CALCULATING PAY QUANTITIES UNDER GRANULAR BORROW, CRUSHED STONE, STRUCTURAL EARTH EXCAVATION, AND STRUCTURAL ROCK EXCAVATION. DIMENSION A SHALL BE BASED ON PIPE DIAMETER D, AS SET FORTH IN THE FOLLOWING TABLE:

PIPE DIAMETER, D (INCHES)	MAX. TRENCH WIDTH, A (FEET)
4	4.0
6	4.0
8	4.0
10	4.0
12	5.0
15	5.0
18	5.0
21	5.0
24	6.0
27	6.0
30	6.0
36	6.0
42	7.0
48	7.0

PLANNING BOARD REPORT
PORTLAND, MAINE

Mercy Hospital – Phase 2 Expansion
175 Fore River Parkway
Level III Site Plan
PL-000820-2019
Northern Light Health, Applicant

Submitted to: Brandon Mazer, Chair and Members of the Portland Planning Board Public Hearing Date: February 25, 2020	Prepared by: Matthew Grooms, AICP, Senior Planner Date: February 21, 2020

I. INTRODUCTION

Northern Light Health submitted a Level III site plan application for the second phase of Mercy Hospital's Fore River Campus development; a multi-phase proposal outlined by a 2001 Conditional Zoning Agreement to redevelop a large industrial and railroad site as a new medical facility. For a more detailed history of the conditional zoning agreement, phase one of this development and the overall process to date, please see the memo submitted for the first Planning Board workshop.

Figure 1: Aerial view of the Mercy Fore River Campus

Phase two involves construction of a new four-story addition to the rear of the existing hospital building, and development of a new two-story Ambulatory Surgical Center (ASC) building, which would be built on the central part of the site on an infilled portion of the existing wetland pond. Aside from the expansion of on-site uses, the development also provides 95 additional surface parking spaces for use by patients, visitors and staff, and a comprehensive reconfiguration of the campus open space scheme.

A preliminary workshop was held by the Planning Board on November 26, 2019. At that workshop, members of the Board focused heavily on the proposal to fill in the majority of the existing wet pond, which was previously identified as valuable natural habitat and a key component of the 2001 conditional zoning agreement and subsequent 2006 site plan approval for Phase I.

A second workshop was held on January 28, 2019, where staff and the applicant continued to discuss compliance of the project with the requirements of the conditional zoning agreement, responses to Board and staff feedback from prior reviews and in particular, justification for filling of the wetland area. Based upon feedback from the second workshop, this item is now being referred to the Planning Board for a public hearing, and is being reviewed against the requirements of the CZA and the city's site plan requirements.

Notices have been sent to 56 property owners and interested citizens in the vicinity of the project and a legal advertisement was published in the February 16th and 17th editions of the *Portland Press Herald*.

Applicant: Northern Light Health (Nick Munro, Facility Project Manager)

Consultants: Gorrill-Palmer (Steve Bushey)

II. REQUIRED REVIEWS

Waiver Requests	Applicable Standards
Request: Waiver of the flooding standard. Staff Comments: Reviewers do not have any concerns regarding this waiver request (*Att. A2*)	Technical Manual, *Section 5 Portland Stormwater Management Standards and MaineDEP Chapter 500 Stormwater Management*
Request: Waiver to omit curb and sidewalk along the Fore River Parkway between the southerly driveway and the north end of the property Staff Comments: Staff is requesting evidence of compliance with Sec. 14-506 of the City Code.	Site Plan Standard 14-526 (a) 2 c
Review	**Applicable Standards**
Site Plan	Section 14-526
Conditional Zoning Agreement 2001	Section 10 *Development Standards*

III. PROJECT DATA

Existing Zoning	2001 Conditional Zoning Agreement
Existing Use	Hospital and Medical Office Building (MOB) and associated facilities and parking
Proposed Use	Hospital, MOB and Ambulatory Surgical Center (ASC) & associated facilities
Parcel Size	33.5 acres total; approx. 20 acres developable

	Existing	Proposed	Net Change
Building Footprint	64, 629 SF	102,343 SF	Hospital: +20,140 sq ft
Building Floor Area	Hospital: 138,099sq ft MOB: 82,186 sq ft	Hospital: 192,988 sq ft MOB:82,186 sq ft ASC: 34,987 sq ft	Hospital: +54,889 sq ft MOB: 0 New ASC: +34,987sq ft
Impervious Surface Area	50%	66%	16%
Parking Spaces	762	857	+95
Bicycle Parking Spaces	58 spaces		

Figure 2: Proposed Phase 2 Site Layout

IV. PLANNING BOARD WORKSHOPS

A. NOVEMBER 26, 2019

In its initial workshop, staff and the applicant provided the Board with a first look at phase 2 of this development proposal and received the following feedback:

- **Wetland Fill**: The existing wetland is a critical component of both the CZA and approved Master Plan for Mercy Hospital and has previously been recognized as valuable wildlife habitat for various bird species and has been integrated into the Portland Trails system. At the November workshop, the Board asked that additional analysis be completed to determine whether or not the pond was protected under the CZA agreement on the basis of its value as wildlife habitat.

- **Design Review:** In reviewing the building design for both the hospital addition and ASC building, the Board requested that the hospital extension entrance be made more prominent, and that the screening of rooftop mechanical equipment be further assessed, particularly in consideration of potential long views of the building from vantage points on the Western Promenade.

- **Pedestrian Circulation:** At the time of the November workshop, a concept for internal site circulation had not been fully developed, and the Board requested a plan identifying exact sidewalk locations with prioritization given to pedestrian circulation.

- **Landscaping:** The Board stressed the need for a more robust landscape plan with a focus on recreating natural spaces lost as part of this development proposal and as buffer to soften proposed surface parking.

- **Signage:** One member of the Board weighed in on the scale of proposed hospital logo, which was identified as being too large for the building.

- **Portland Trails and Bus Stop:** At the time of the November workshop, it was unclear to what extent the proposed open space reconfiguration would impact the existing easement held by Portland Trails and similarly, whether or not the proposed bus shelter relocation could occur as part of this phase of the development.

B. JANUARY 28, 2020

Following the first workshop, the applicant developed a more thorough letter of compliance outlining how the development as proposed was consistent with the requirements of the CZA with regards to the wetland fill, noting site and programmatic constraints, infeasibility of an alternative site configuration based upon a robust alternatives analysis, and issuance of the NRPA permit by Maine DEP for wetland fill as documented. As an effort to mitigate these impacts, the applicant agreed to work with the City to protect and maintain the future pond in perpetuity as a key resource for the campus, and have designed the pond and surrounding area as a natural space suitable for use by wildlife in the future.

Staff also reviewed the materials and researched areas of critical wildlife habitat in the state, as identified by Maine Department of Inland Fisheries and Wildlife, and found that the pond in question is not identified as prime habitat. The points below highlight areas of discussion at this second workshop, and relevant updates to topics listed at the first workshop.

- **Wetland Fill**: The Board articulated a general concern with filling existing wetlands, and noted that the Maine DEP threshold for permitting wetland fill should not be considered as satisfactory justification. Nevertheless, the Board noted that the City did not have regulations that would prevent such filling, and indicated that they would be supportive of the proposal as shown in a public hearing. The Board did request, that if in the future, a parking structure were to be built that could accommodate the on-site parking demand more efficiently

than the existing and proposed surface parking areas, that the Hospital should consider a plan to replace such surface parking with landscaped or pervious surface, and add to the natural space on the campus.

- **Design Review:** Prior to the second workshop, the building floor plan and elevations for the hospital addition were updated to include more pronounced entry points and a more logical first floor layout as requested by a member of the Board. The other remaining comment, regarding screening of mechanical equipment atop the ASC building, was addressed in the second workshop, when the applicant indicated that they would provide the requested screening.

- **Pedestrian Circulation:** A pedestrian circulation plan was provided following the first workshop, and staff had limited comments related to bicycle facility and crosswalk improvements. The applicant has since provided an updated plan and accompanying narrative that addresses all of staff's comments related to site circulation.

- **Landscaping:** The Board stressed the need for a more robust landscape plan with a focus on recreating natural spaces lost as part of this development proposal and as buffer to soften proposed surface parking. The landscape plan has been subsequently revised to address these concerns.

- **Signage:** At both the first and second workshop, the Board and staff requested that the scale and quantity of building mounted signs be reduced. Prior to the second workshop, one sign was removed, and following the second workshop, the design of the sign was revised to staff's satisfaction.

- **Portland Trails and Bus Stop:** At the time of the November workshop, it was unclear to what extent the proposed open space reconfiguration would impact the existing easement held by Portland Trails and similarly, whether or not the proposed bus shelter relocation could occur as part of this phase of the development. The applicant has since coordinated with Portland Trails and has agreed to work with Portland Trails on trail amenities, design and location. Regarding the bus shelter, the applicant is currently in discussions with METRO, to determine a date when the new service would become active. Staff will be looking for an update from the applicant at the public hearing.

- **Transportation Demand Management (TDM):** At the second workshop, staff stated that the TDM plan included with the initial application material did not conform with City standards, and that it needed to be updated. A TDM plan was received on February 21, 2020 and has had minimal review by staff. This document is included within this application material, and will be discussed in detail at the public hearing. It should be noted that finalization of the TDM plan is being suggested as a condition of approval.

V. NEIGHBORHOOD MEETING AND PUBLIC COMMENT

A neighborhood meeting was held on December 11th and attended by two (2) members of the public. A copy of the neighborhood meeting minutes and sign-in sheet are attached to this memo. Additionally, as of the writing of this memo, one (1) written public comment was received by the Planning Office. Comments raised have focused on the proposed loss of existing wetland, maintaining and enhancing connections to local open space sites such as the Fore River Parkway trail, status of the State Street facility and questions regarding the architecture and energy efficiency of the proposed buildings. For detailed responses to these questions, please see the attached minutes (Attachment Q).

VI. UPDATE ON ZONING ANALYSIS – CONDITIONAL ZONING AGREEMENT 2001

A. Master Plan

The City Council approved the Conditional Zoning Agreement (CZA) in 2001 that allowed this large (then 42 acres) site to be rezoned from IH to medical and related uses as listed in the CZA. A "Conceptual" Plan was attached to the CZA and the CZA language refers to it as follows:

*The **PROPERTY** shall be developed substantially in accordance with the conceptual master plan shown on Attachment 2, provided, however, that each building, whether classified as a major or minor development, shall be subject to site plan review by the Planning Board, and if applicable, subdivision review by the Planning Board. Any site plan review applications shall fully comply with the detailed site plan application requirements contained in article V (site plan) of the Land Use Code. The Planning Board may permit deviations from the conceptual master plan, as long as the deviations are consistent with the purposes of this Agreement.*

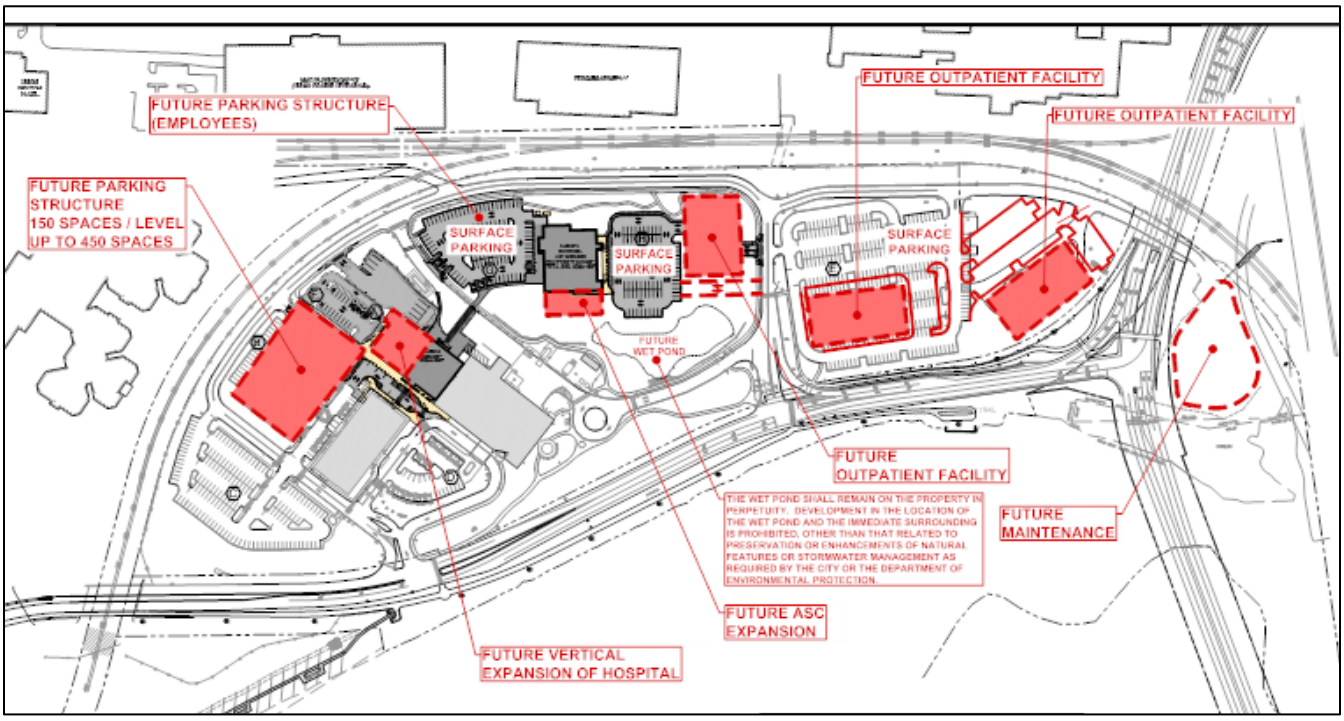

Figure 3: Revised Concept Plan for Future Phases

Staff Finding: The currently adopted Master Plan identifies a building program that is incompatible with the phase two layout, as future buildings are shown directly within the now proposed wet pond location. In response to this, the applicant has developed a new concept plan, which provides locations for future building, parking and open space areas that does not conflict with the site plan submitted for phase two. Staff have reviewed the updated Master Plan and find that it complies with this requirement.

In order to ensure future consistency, the applicant's attorney has worked with the City to legally formalize the proposed site layout with specific respect to the new wet pond location, which would be maintained for future use as an amenity and stormwater feature of Mercy Hospital's Fore River campus. A draft of this document is attached, and its execution and recording are suggested as a condition of approval.

B. Development Standards

The CZA includes a set of nine (9) development standards specifically tailored to the unique characteristics of this site and future build-out of a hospital campus. In many instances, these standards relate directly to or feature considerable overlap with general site plan review standards, and provide a regulatory framework on such themes as building and site design principles, landscaping and preservation of natural spaces, vehicular and pedestrian circulation and signage. Given this significant overlap between standards, the development review section, later in this memorandum, regularly refers back to analysis or narrative provided in this section. CZA standards and staff discussion of compliance are described below.

CZA Preamble - Development Standards: All site plans may be approved by the Planning Board only if, in addition to the dimensional requirements of paragraph 11 and the applicable provisions of article IV (subdivisions) and article V (site Plan), the development meets the following development standards.

1. *Design relationship to site*: Development proposals shall demonstrate a reasonably unified design of the site in a campus-like setting, including the architecture, the layout of the buildings, pedestrian and vehicular circulation plan, open space, drainage, and the topography, soil conditions, vegetation, and other natural features of the site. Integration of open spaces and natural features shall be achieved by incorporation of outdoor amenities for the benefit of users of the site, such as jogging and walking trails, gardens, and benches. The proposed layout of buildings and uses shall demonstrate compatibility between the buildings and other site features within the site. Consideration shall be given to compatibility of proposed perimeter on-site development with the existing and future uses off-site but adjacent to the PROPERTY.

   Staff Finding: Staff initially advised the applicant at the pre-application meeting that the proposed location of the ASC did not appear well-integrated into the campus, particularly as the building and associated surface parking and stormwater management resulted in the loss of the existing wetland. The wetland marsh area was preserved in 2006 to provide a campus amenity with aesthetic, open space and wildlife benefits and includes a public trail as formalized as part of the 2006 site plan approval.

   Following the Planning Board workshop, city staff met with the applicant to discuss outstanding concerns, in particular, the elimination of the existing pond. The applicant articulated that the proposed program takes into account changing trends in the healthcare field which necessitated a reconfiguration of the site from the approved Master Plan. Additionally, other site constraints (including required parking and circulation infrastructure) and plans for future expansion precluded the applicant from being able to preserve the existing pond in its entirety. In 2013, in anticipation of this expansion, the applicant secured approval from Maine DEP to fill in this wetland, and currently have valid authorization to complete this work.

   Corporation Counsel, in reviewing the development criteria of the CZA, determined that the proposal to shrink and relocate the pond, while maintaining it as a prominent resource and amenity of the development, was still consistent with requirements of the CZA. As mentioned above, the applicant is coordinating with the city to execute a legal agreement that would protect the future wet pond in perpetuity for use by visitors and staff. In addition to serving as a stormwater feature, the pond would be designed to function in a more recreational capacity as well, with trails around the pond that would connect to the local trail network managed by Portland Trails.

   At the November workshop, one of the key concerns raised related to the filling of the wet pond was the loss of high-value bird habitat. Following that workshop, staff reviewed state resources provided by Maine DEP, and confirmed that the wet pond location is not identified as high value wildlife habitat. Significant wildlife habitats are defined under Maine's Natural Resources Protection Act (NRPA) and such data is reviewed as part of the NRPA permitting process, which the applicant went through in 2013 for authorization by the state to fill in the wetland. It is staff's understanding that the DEP NRPA permit was in the process of being extended. Prior to the public hearing, the applicant should provide evidence that the NRPA permit remains valid, otherwise staff would suggest a condition of approval conditioning the start of construction on this permit.

   Staff continue to recommend that future development be cognizant of pedestrian circulation patterns, new impervious surface creation and the creation, in particular new surface parking, improved integration of the site with surrounding areas of the city and continued maintenance of the campus's open space features. In light of the applicant's documentation of efforts to identify the best alternative, and efforts to mitigate the loss of the wetland, staff find this requirement to be met.

2. *Landscaping:* Development proposals shall include a landscape program. All land areas not covered by structures, parking areas, or circulation facilities shall be landscaped and maintained. In order to soften the visual impact of large expanses of pavement in parking lots, vegetation shall be planted or retained in islands or planting strips where required by article IV (subdivisions) and article V (site plan) of the Land Use Code.

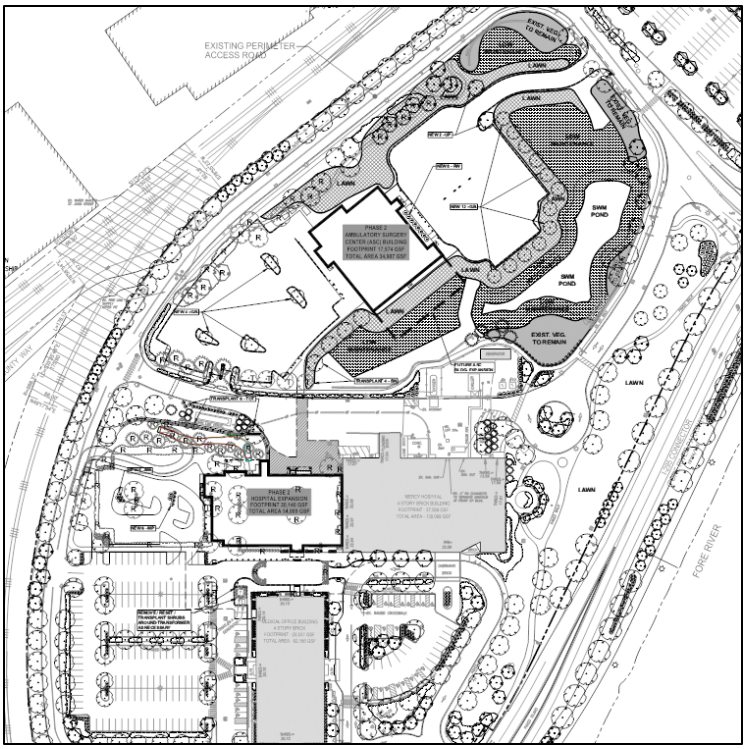

Figure 4: Proposed landscaping plan. Per CZA requirements, landscaping is intended to soften the visual impact of the site, in particular along Fore River Parkway, and enhance existing natural features.

Staff Finding: The applicant has submitted a revised landscape plan specifically focused on the area around the proposed wet pond in response to prior staff comments and Board feedback. In sum, the proposed landscape plan is robust, accounting for a desire to see natural habitat, in addition to site buffering vegetation and shade trees. The proposed landscape plan meets the intent of this standard.

3. *Pedestrian Orientation:* Development proposals shall include an integrated pedestrian circulation system, including internal sidewalks, to take advantage of the topography and natural features of the site and providing for safe pedestrian access to all buildings and parking areas with the ability to conveniently access all developed portions of the site without additional driving. The pedestrian circulation system shall link with the shoreline trail feature of the site.

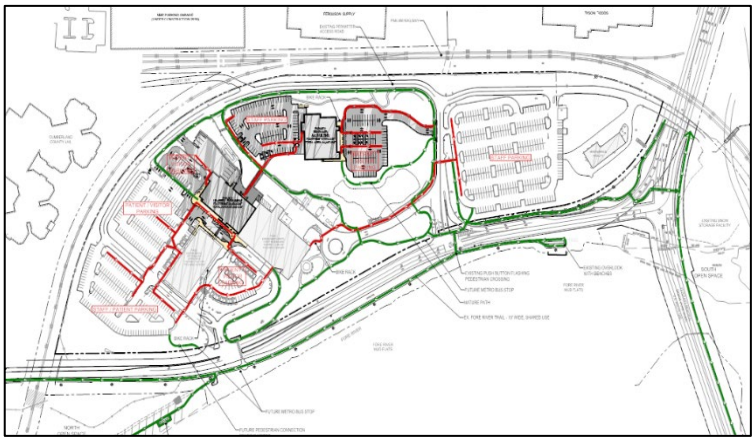

Figure 5: Pedestrian Circulation Plan. Note lines in red identify routes between buildings and parking, while lines in green represent routes to open space.

Staff Finding: The applicant has submitted a revised Pedestrian Circulation Plan that addresses comments provided to the applicant at the January 28th workshop, related to crosswalk locations, bicycle facility enhancements, and use of a Rectangular Rapid Flash Beacon (RRFB) at one crossing location. Regarding use of the RRFB, a condition is suggested that contemplates future design and planning for installation of this signal.

4. *Vehicular Access and Circulation:* The primary access to serve the entire development will be from two access points or two access points and a slip lane from the CONNECTOR as may be further developed or modified by joint agreement of the City, MDOT and the applicant. Vehicular circulation through internal driveways and roadways will provide safe and orderly access to all developed portions of the site.

Staff Finding: The proposals generally meet this standard (Attachment 1).

5. *Buffers and Screens*: Development proposals shall include appropriate measures of a dense and continuous nature (for example, a double staggered row of white pine twenty-five (25) feet on center, etc.) in order to buffer parking lot visibility from public roads.

   Staff Finding: As noted above under landscape, the landscape plan has been revised to show substantial landscaping around and within the surface parking areas to achieve the scale of buffering indicated by the CZA.

6. *Preservation of Natural Features*: Development proposals shall identify the extent to which the developer will preserve natural features including, but not limited to, existing vegetation, flood plains, rock outcroppings, surface water bodies, drainage swales and courses, and wetlands; provided any such program shall consider and be sensitive to the need to preserve such natural features.

   Staff Finding: The 3.5-acre wetlands were required to be preserved by both the MDEP and the City as part of the 2006 Site Plan review. They were seen as having wildlife, public and patient amenity value and comprising a key element in the campus open space system.

   As part of this second phase, the applicant has identified, under a full build-out scenario of the site, that it would be impossible to maintain the existing wetland and open space feature at its current extent. Eight (8) alternative configurations were assessed, which were provided to Maine DEP for consideration as part of their NRPA permit application. Maine DEP, in reviewing this application, made a similar conclusion, and permitted the proposed filling of the existing wet pond feature.

   The development standard states that "development proposals shall identify the extent to which the developer will preserve natural features … provided any such program shall consider and be sensitive to the need to preserve such natural features". In reviewing the CZA language, Corporation Counsel determined that the CZA and prior Planning Board approvals, which permits future deviation from the concept plan, does not require that the Hospital retain the current extent of its open space and natural area configuration. The applicant is responsible for proposing a strategy moving forward that achieves the aim of this standard.

Figure 6: View of the existing pond from the internal circulation driveway

Figure 7: Proposed open space configuration with pond, trail and landscaping amenities

To mitigate this impact, the applicant is proposing a smaller 0.5-acre wet pond designed to have a natural appearance, that will double as a recreational resource for use by hospital staff, visitors and patients as well as a component of the site's stormwater management system. Plans provided show a new trail network and open space area separated from vehicular traffic and generous landscaping around the pond. While reduced in size, Planning staff find that the proposed combination of pond, landscaping and pedestrian oriented amenities fulfills the requirement for preservation of natural features standard. In order to preserve this proposed feature, the applicant is working with the City to develop a legal agreement for preservation of and continued maintenance of this feature. Staff find this standard to be met.

7. ***Architectural Design:*** All buildings shall be designed or approved by a registered architect in the State of Maine. The scale, texture, colors, and massing of the buildings shall be coordinated. The full range of high-quality, permanent, and traditional or contemporary building materials and technology may be incorporated in a manner so that the development as a whole embodies distinguishing attributes that achieve the developer's desired degree of excellence and are in conformance with the architectural guidelines provided in any private development restrictions. Particular emphasis shall be placed on the appearance of building facades from public streets and highways including the CONNECTOR, from driveway and parking areas, and from other nearby buildings. Building elevation drawings shall be submitted which indicate architectural style, exterior finishes and color, building height and scale, and location and scale of window and door openings. Samples of exterior building materials shall also be submitted.

Figure 8: View of the Hospital addition, with emphasized entrance as requested by the Planning Board.

Figure 9: Rendering of ASC Building from Fore River Parkway with screening

Figure 10: Rendering of ASC Building

Staff Finding: The applicant has submitted elevations and floor plans of the hospital building addition and the ASC. These have been reviewed by the city's Urban Designer in the context of the CZA language above, as well as in relation to the Private Development Restrictions (*Attachment 1d*) that were approved as a condition to the 2006 Site Plan approval to help achieve coordination of design details across the campus.

The Design Review is included in *Attachment 1d* and finds the design approach for the two new buildings to be consistent with this standard.

8. ***Signs:*** Signage shall be focused internally to the site or to the CONNECTOR and shall not be oriented or scaled to address Route 1 or Interstate 295, with the exception of the hospital and major office buildings. Development proposals shall identify all proposed signage. Signs shall be designed in proportion and character with the building facades. All signs shall be constructed of permanent materials and shall be coordinated with the building and landscaping design through the use of appropriate materials and finishes.

Staff Finding: The applicant is proposing to revise both the building signs and the ground "information" signs to reflect the new name/logo of the hospital and to incorporate new signage on the buildings. Based upon feedback provided by the Planning Board and staff at the first and second workshop, the applicant has further revised their proposed signage package, eliminating the signage initially shown on the east façade, though retaining the new sign on the south façade, facing Fore River Parkway. The proposed replacement and new building signage satisfy this requirement.

9. ***Master Plan:*** Prior to development on the PROPERTY, MERCY shall provide a master plan of the campus. The master plan shall include the following: The location of the building(s) on the site; infrastructure of the site; identification of common areas; traffic circulation, architectural character and treatment of the building(s); proposed building envelopes; phasing and timing of the development; private development restrictions; and such other information necessary and sufficient to ensure compliance with the standards in this section. Master plans are dynamic representations that assist in guiding projects through phased development. Master plans are flexible and adaptable to changes that occur within the development process. The master plan shall be subject to periodic revision and update as needed and as phased development occurs over time.

Staff Finding: The applicant has provided an updated concept plan for future build-out of the Mercy Hospital Campus that is now consistent with the proposed phase two development. While the Master Plan development standard does not specifically require that the Master Plan be updated with each individual phase, staff continue to recommend that the document approved as part of the 2006 site plan review for phase one, be updated to reflect anticipated changes to program and site usage as shown in the revised concept plan. An updated narrative was submitted following the second workshop that effectively demonstrates compliance; however, staff continue to ask that the Master Plan Document be repackaged, which is included as a draft condition of approval.

Summary of Master Plan Data

Site Data	2001	2006	2020
Usable site (taking account loss for roads/bridges and adding in filled pond area in 2014)	25.46 acres	24.91 acres	Approximately 20 acres
Building footprint	183,335 sf	128,000 sf	Unspecified
Building floorspace	433,000 sf	544,902 sf	500,000 – 600,000 sf

Parking	1251 surface spaces	1467, some in garage	700-900 spaces (structured), unspecified surface
Impervious surface (acres)	Approx 22 acres	Approx 13 acres	Unspecified

10. *Dimensional Requirements:* The following dimensional requirements shall apply to the PROPERTY as a whole, and not additionally to individual lots (if any) within the PROPERTY:
    a. Maximum imperious surface ratio: Eighty (80) percent;
    b. Maximum building height: Ninety (90) feet;
    c. Minimum front yard landscaped buffer: Twenty (20) feet from the edge of the CONNECTOR right-of-way shall be in the form of a landscaped buffer provided, however, that the area within such buffer may include a retaining wall, walkway, trail, or pathway but no buildings, roadways, parking areas, or other expanses of pavement.
    d. Minimum side yards: Ten (10) feet;
    e. Minimum rear yard: Ten (10) feet;
    f. Pavement setback from lot boundaries: Fifteen (15) feet.

    Staff Finding: The proposal as shown conforms with the dimensional requirements established by the CZA agreement for this site. As stated above, staff is asking that the Master Plan

VII. SITE PLAN STANDARDS (SECTION 14-526)

The proposed development has been reviewed by staff for conformance with the relevant review standards of Portland's site plan ordinance and applicable regulations. Staff comments are listed below.

a) Transportation Standards

a. Impact on Surrounding Street Systems and Access and Circulation

The Traffic Engineering Reviewer has requested further information to evaluate the impacts of the proposals on the surrounding street system. In reviewing the data provided, staff have identified that the City will be implementing traffic signal improvements that would be expected to improve interface of the site with the adjacent street system.

DPW had stated that on-street bicycle accommodations (shoulders and dedicated bike lanes) are not provided consistently along Fore River Parkway. According to DPW, the most likely means of access for bicyclists is via the trail network. Their recommendation was to have pedestrian and bicycle-scale wayfinding signage be added, especially near crossing locations, points of interest and along primary routes to and from the site. The site plan has since been updated to reflect this comment.

b. Public Transit Access

The applicant has submitted a Plan showing existing and future metro Routes and Stops which identify the existing bus shelter being eliminated and replaced by two new bus shelters along Fore River Parkway that would take advantage of changes in Metro's routing, where in both an east and west bound bus would serve the campus. The City is asking that the applicant confirm the status of these conversations with Metro and revise the plan if necessary. Final determination of the shelter location is included as a draft condition of approval.

c. Parking

The applicant is providing a sufficient parking supply to accommodate the proposed uses as evidenced by the trip generation calculations that were submitted. Staff continue to recommend that structured parking be evaluated as part of any future phase.

d. Transportation Demand Management (TDM)

The applicant submitted a revised TDM plan on February 21, 2020, and staff have had limited time to review the material submitted. Staff offer the following preliminary comments, and would ask that finalization of the TDM plan be made a condition of approval.

- The Draft TDM Plan provides a good framework for the consolidated/expanded Mercy Hospital site situated on the Fore River Parkway covering all of the essential Plan elements required.
- Requested changes to the Draft Plan that would significantly strengthen it include:
    - More emphasis on specific incentives for bicycling, walking, bus transit and carpooling above and beyond promotion and encouragement - we will share examples of incentives by other large employers that are having some success
    - More reliance on electronic display and dissemination of TDM opportunities beyond the static bulletin board display(s) mentioned is needed to keep TDM promotion actively in front of employees, staff and visitors - the information on the use of the employee/staff intranet and external website should be expanded and consolidated within the 'Information and Marketing' section
    - Commitment to participation in a Transportation Management Association once one is formed.

b) Environmental Quality Standards

1. Preservation of Significant Natural Features
   In the context of the CZA Development Standards regarding the preservation of natural features staff have suggested that the applicant mitigate impact to the existing wetland by retaining that feature to the extent possible and enhancing the remaining feature with a robust landscaping plan comprised largely of native species to establish a 'natural' feel for the new pond. Staff are also requesting that the updated order for the Maine DEP SLOD/NRPA permit be provided as a condition of approval.

2. Landscaping and Landscape Preservation *See above under compliance with CZA Development Standards*

3. Water Quality, Storm Water Management and Erosion Control
   The proposed stormwater management wet pond located in the area of the existing wetlands has been reviewed by the Peer Engineer and is considered acceptable in that it meets the site plan and chapter 500 standards. Similarly, staff support a waiver of the Maine DEP Ch. 500 Flooding Standard, on account of the site's proximity to the Fore River.

c) Public Infrastructure and Community Safety Standards

1. Availability and Adequate Capacity of Public Utilities
   The applicant has provided all requisite ability to serve letters.

d) Site Lighting Standards -

The applicant has provided lighting details and a photometric plan which complies with the City's lighting standards as listed under Section 12 of the Technical Manual.

VIII. STAFF RECOMMENDATION

Subject to the proposed motions and conditions of approval listed below, Planning Division staff recommends that the Board find that the Level III site plan application (PL-000820-2019) for phase 2 of Mercy Hospital's Fore River Parkway Campus development, meets the applicable standards of Portland's Land Use Code.

IX. PROPOSED MOTIONS FOR THE BOARD TO CONSIDER

A. WAIVERS

On the basis of the application, plans, reports and other information submitted by the applicant, findings and recommendations contained in the Planning Board Report for the public hearing on February 25, 2020 for application PL-000820-2019 relevant to the Site Plan Standards of the Land Use Code and Portland's Technical and Design Standards, and other regulations, and the testimony presented at the Planning Board Public Hearing:

1. Maine DEP Ch. 500 Flooding Standard
   The Planning Board [**finds / does not find**] based upon the Civil Engineering Peer Reviewers recommendation, that extraordinary conditions exist or undue hardship may result from strict compliance with the Technical Manual standard (Section 5.III) which requires that all Level III site plans comply with Maine DEP Chapter 500's Flooding Standard, that substantial justice and the public interest are secured with the proposed variation in this standard, and that variation is consistent with the intent of the ordinance. The Planning Board [**waives/ does not waive**] the Technical Manual standard Section 5.III to allow direct discharge of stormwater runoff into the Fore River.

2. Sidewalk and Curbing Waiver
   The Planning Board [**finds / does not find**] based upon the Department of Public Work's review, that extraordinary conditions exist or undue hardship may result from strict compliance with the Site Plan Standard (Section 14-526 (a) 2.c) which requires that development provide sidewalks and curbing along all frontages, that substantial justice and the public interest are secured with the proposed variation in this standard, and that variation is consistent with the intent of the ordinance. The Planning Board [**waives/ does not waive**] the Technical Manual standard Section 14-526(a) 2.c on the basis of waiver criteria one and three, to not require sidewalk and curbing along the property's Fore River Parkway frontage.

B. SITE PLAN REVIEW

On the basis of the application, plans, reports and other information submitted by the applicant; findings and recommendations contained in the Planning Board Report for the public hearing on February 25, 2020 for application #PL-000820-2019 relevant to the site plan regulations; and the testimony presented at the Planning Board hearing, the Planning Board [**finds/does not find**] that the plan is in conformance with the site plan standards of the land use code, subject to the following conditions of approval:

PRIOR TO APPLYING FOR A BUILDING PERMIT

1. A copy of the DEP SLOD/NRPA permit shall be provided to the City demonstrating authorization to complete this development.
2. The Master Plan document, approved in 2006, shall be updated to include all relevant information for future phases as shown in the updated concept plan.
3. A revised stormwater maintenance agreement shall be provided for review and approval by DPW and Corporation Counsel.

PRIOR TO ISSUANCE OF A BUILDING PERMIT

4. The applicant shall coordinate with METRO on the location of the new bus shelter, and in the event that no new shelter is proposed, a revised site plan showing any adjustments shall be provided.
5. The Transportation Demand Management (TDM) Plan shall be finalized to the satisfaction of Planning staff and shall incorporate feedback as listed in this report.
6. The applicant shall finalize the protective agreement for the proposed pond and associated features to the satisfaction of the City, and then execute and record this agreement.

PRIOR TO ISSUANCE OF A CERTIFICATE OF OCCUPANCY

7. The applicant shall coordinate with METRO and DPW on the exact positioning of the Rectangular Rapid Flashing Beacon (RRFB) and any signage that may be required, and will install the RRFB accordingly.

175 Fore River Parkway - Mercy Hospital comments

Mike Tremblay <mtremblay@portlandmaine.gov> Fri, Feb 21, 2020 at 1:40 PM
To: Matthew Grooms <mgrooms@portlandmaine.gov>

Matt,

The waiver table I'm looking at is from 8/30/2019 so it may be old, but here are my responses:

Waiver 2: Curb and sidewalk -- DPW does not oppose the waiver request to provide curb and sidewalk from the southerly driveway to the north end of the property. The waiver request is supported by two of the five conditions for a sidewalk waiver as outlined in Section 14-506 of the Land Use Code. Criterion 1 states, "*There is no reasonable expectation for pedestrian usage coming from, going to and traversing the site.".* This critereon applies to the section of sidewalk that the Applicant is applying the waiver for. There are no destinations on the east side of Fore River Parkway to the north of the project site, and given that the railroad bridge north of the site does not provide a sidewalk on the east side of the bridge, it is unlikely this will change in the foreseeable future. As such, this criterion is valid. Secondly, Critereon 3 states " *A safe alternative-walking route is reasonably and safely available, for example, by way of a sidewalk on the other side of the street that is lightly traveled.".* The Fore River Parkway Trail is located across Fore River Parkway from the project site. This trail provides regional connectivity for pedestrians and bicyclists. The applicant has agreed to provide safety enhancements to access this trail, and have committed to installing wayfinding signage to direct pedestrians to the designated walking route.

Waiver 3: Bicycle parking -- DPW does not support a waiver on bicycle parking; however, the Applicant appears to have met the minimum requirements for bicycle parking and therefore this waiver is no longer required.

PL 820-2019 Mercy Hospital Phase 2/175 Fore River Parkway

1 message

Bruce Hyman <bhyman@portlandmaine.gov> Fri, Feb 21, 2020 at 11:34 AM
To: Matthew Grooms <mgrooms@portlandmaine.gov>
Cc: James Rather <jrather@portlandmaine.gov>, Michael Tremblay <mtremblay@portlandmaine.gov>, Tom Errico <thomas.errico@tylin.com>, Helen Donaldson <hcd@portlandmaine.gov>

Good morning, Matt,

The following are my comments related to the Draft Transportation Demand Management Plan (dated 2/20/20) submitted by the applicant:

- The Draft TDM Plan provides a good framework for the consolidated/expanded Mercy Hospital site situated on the Fore River Parkway covering all of the essential Plan elements required.
- Requested changes to the Draft Plan that would significantly strengthen it include:
  - More emphasis on specific incentives for bicycling, walking, bus transit and carpooling above and beyond promotion and encouragement - we will share examples of incentives by other large employers that are having some success
  - More reliance on electronic display and dissemination of TDM opportunities beyond the static bulletin board display(s) mentioned is needed to keep TDM promotion actively in front of employees, staff and visitors - the information on the use of the employee/staff intranet and external website should be expanded and consolidated within the 'Information and Marketing' section
  - Commitment to participation in a Transportation Management Association once one is formed.

I have other, more specific comments/requested changes related to some of the wording and organization of the Draft Plan that I will share with the applicant.

I suggest that satisfactory revisions related to these comments be the basis for a Condition of Approval by the Planning Board.

Please don't hesitate to contact me if you or the applicant have any questions.

Bruce

Mercy Hospital - DEP Materials

Lauren Swett <lswett@woodardcurran.com> Fri, Feb 21, 2020 at 1:10 PM
To: Matthew Grooms <mgrooms@portlandmaine.gov>

Hi Matt,

Yes, I think a condition would be warranted. Steve notes they are waiting on the receipt of the updated order, so the condition could be as simple as providing a copy of the updated Maine DEP SLOD/NRPA permit.

Steve also note that they are working with Corporation Council on preservation of the pond, I don't know if that has been finalized or requires a condition? Steve was also waiting for a sewer ability to serve from Brad.

I am good with everything else they have provided.

Thanks,

Lauren

Subject: Application for Level III Site Plan Application
Northern Light℠ Mercy Hospital – Fore River Campus Consolidation

Dear Christine:

On behalf of **Mercy Hospital dba Northern Light℠ Mercy Hospital** (Applicant), our office is pleased to provide the uploaded submission materials for a Level III Site Plan Application. This submission package is intended to meet the City's Level III Site Plan Submission requirements as outlined in the Level III Site Plan Checklist as well as Section 14-526 of the Code of Ordinances.

PROJECT OVERVIEW

Northern Light℠ Mercy Hospital is proposing to develop their Phase 2 Hospital expansion on the Fore River development site with construction to begin in early 2020, pending City Site Plan approval and building permits from now thru the end of the year. The site is currently in the Mercy Hospital Contract Zone District. The site is identified in the City's Assessors Maps as follows:

Tax Map	Block/Lot
73	A-1 B-2 (MUD FLATS) B-7
74	A-1 A-2 B-3 (MUD FLATS) B-11 B-12
74A	A-1 (MUD FLATS) A-2 (MUD FLATS)
75	A-3 B-4 B-30 (MUD FLATS)
75A	A-1 (MUD FLATS) A-17
76	B-33 B-1 (MUD FLATS) B-2

The current development plan includes the following uses:

- The Phase 2 Hospital expansion wherein all State Street hospital functions are relocated to the Fore River campus. This will include an additional 54,889 SF of Hospital program area over a 20,140 SF building expansion footprint. The hospital expansion will include Emergency Room services, thus a new parking area with 19 spaces designated for emergency room patient and visitors will be provided to the north side of the expansion. Additional parking for up to 8 ambulances will also be provided and designated entries for both patient drop off and ambulance drop off/pick up to the emergency room have been depicted on the site plan. This Hospital expansion was contemplated back in 2006 at the time of the original Phase 1 site plan review and its positioning is in keeping with the plans reviewed and approved at that time.

- The front entry drive past the existing main Hospital entrance will be extended between the existing Hospital, proposed expansion and the existing Medical Office thus connecting the front of the Hospital to the parking lot to the north side of the MOB. This one-way drive will provide access to the expansion and the MOB.

- A 34,987 SF Ambulatory Surgical Center (ASC) will be established within the former borrow pit that will be partially filled. The two-story building will be accessed from a new driveway off the signalized southerly site entrance. Building access will also include staff parking and entry at the rear of the building. The ASC positioning will keep its visibility somewhat muted given the location and higher building height of the existing hospital in the foreground and the much larger new MMC 2,500-space parking garage in the background. The ASC positioning is intended to allow for possible future building development within the center of the property whereby additional Hospital expansion and/or medical office space opportunities can be realized based on the direct proximity to the existing hospital building. Additionally, the ASC is positioned for convenient access off the southerly, signalized site entrance off the Fore River Parkway and also for ease of utility connectivity to the existing utilities that are located along the site's rear perimeter, nearest the railroad tracks.

- Accessory uses, including but not limited to, surface parking facilities, ASC utility services, stormwater management systems, and site amenities are also part of the current proposal. A new parking lot containing 103 parking spaces will be provided on the north end of the ASC site and this parking is expected to replace the displaced parking due to the expansion. An additional parking lot of 73 spaces will be provided on the south side of the ASC and this lot will be designated specifically for ASC use. The total onsite parking available will be 857 spaces, which will exceed the required by code parking requirement of 679 spaces. The expected parking demand for the site upon completion of the Hospital expansion and the ASC is met with the 857 spaces as that provides for a "practical capacity" factor of around 25%. A parking demand study at the Fore River campus completed by Gorrill Palmer in January 2017, determined the parking demand to be about 525 vehicles using the 762 existing spaces. Mercy anticipates the proposed parking will adequately meet proposed demand and this will preclude the need for any further parking expansion or structured parking conditions;

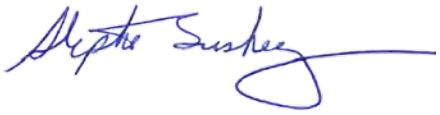
- There will be continued use of public open space along the waterfront at the north and south ends of the Campus and access to the Fore River Trail along the Parkway as well as pedestrian walks throughout the campus.

- Continued use of the south end of the campus for snow storage and/or remote parking.

- Metro Route 1 Congress Street Bus service currently serves the site and this will continue until METRO implements currently planned changes to their service routes. There is an existing bus shelter located on the site that will remain in the interim. We have met with Greg Jordan of Metro and we understand they are currently evaluating route changes and updates that might include two directional routes along the Fore River Parkway. We have also discussed the implementation of new bus stops along the Parkway in front of the site, to replace the current Route – Congress Street circuit that goes through the site. Mercy will continue to work with Metro and City officials on the updates to Metro service for this site over the upcoming months.

CLOSURE

As outlined in the Level III Site Plan submission requirements and checklist, we will upload the following materials:



- General Application Documents
    - Project Description
    - Level III Application Checklist
    - Right, Title and Interest
    - Zoning Assessment
    - Existing and/or Proposed Easements
    - Waiver Request and Waiver Table
    - Financial Capacity
    - Technical Capability
- Transportation
    - Transportation Narrative
    - Traffic Assessment
- Environmental and Landscape Features
    - Narrative to Address Standards
- Environmental and Stormwater
    - Narrative to Address Standards
- Public Infrastructure and Safety
    - Narrative to Address Standards
- Site Design
    - Narrative to Address Standards
- Construction Management Plan
- Site Plans and Architectural Plans

On behalf of the Northern Light℠ Mercy Hospital, we look forward to your continued assistance on the project and we look forward to the next available workshop meeting with the Planning Board. As is required, once we complete the Planning Board workshop, the applicant will be conducting a Neighborhood Meeting. We anticipate this meeting will be conducted prior to the Public Hearing. We also note that we will be filing an amendment application with the Maine Department of Environmental Protection and the US Army Corp of Engineers related to the changes in the development design since the last permit issuance in 2013.

If you have any questions regarding the materials being submitted, please contact this office.

Sincerely,

GORRILL-PALMER

GENERAL DOCUMENT AND DRAWINGS CHECKLIST
Please submit each document as a separate PDF file
Please confirm by electronically checking the boxes to the left

** PLEASE FILL OUT AND UPLOAD SEPARATELY THE ZONING TABLE AND WAIVER TABLE AS NOTED BELOW **

GENERAL APPLICATION DOCUMENTS	
Yes ☑ NA ☐	**Project Description** • Cover Letter with detailed project description
Yes ☑ NA ☐	**Completed Checklist – Level I: Site Alteration** (this document)
Yes ☑ NA ☐	**Right, Title and Interest** • Deeds, leases, or purchase and sales agreements
Yes ☑ NA ☐	**Evidence of State or Federal Approvals** • Permits or letters of non-jurisdiction, if applicable
Yes ☑ NA ☐	**Zoning Assessment** • Table listing required and proposed uses and dimensional standards Zoning Assessment Table
Yes ☑ NA ☐	**Existing and/or Proposed Easements or Covenants, applicable.** • Evidence of existing easements and any proposed easements
Yes ☑ NA ☐	**Waiver Requests** • Written request for waiver describing request and reason Waiver Table
Yes ☑ NA ☐	**Financial Capability** • Letter or evidence from a financial institution or third party verifying financial capacity to undertake project
Yes ☑ NA ☐	**Technical Capability** • Evidence of technical capability of applicant and consultants – resumes and/or examples of past projects

LEVEL II AND LEVEL III SITE PLAN
STANDARDS AND SUBMISSION CHECKLIST

Provide assessment of compliance with standards and include supplemental documentation, as applicable
Please Submit each document as a separate PDF file

TRANSPORTATION

Yes	NA	
☑	☐	**Transportation Analysis- Traffic Impact (14-526 (a) 1)** • Provisions for pedestrian, bicycle, vehicle, and loading circulation and incremental volume of traffic impacts • Traffic Impact Study (Technical Manual, Section 1) if applicable
☑	☐	**Access and Circulation (14-526 (a) 2 a)** • Access and internal circulation, addressing ADA access • Access and egress impacts on traffic flows • Description and use of drive-up features, if applicable
☑	☐	**Loading and Servicing (14-526 (a) 2 b)** • Loading and servicing needs, route and travel way geometrics for deliveries • Turning templates for delivery vehicles, if applicable
☑	☐	**Sidewalks (14-526 (a) 2 c)** • Sidewalks and condition along street frontages and internal walkways • Engineered details for ADA ramps and public sidewalk details meeting sidewalk materials policy and ADA ramp construction details as applicable (Technical Manual, Section 1)
☑	☐	**Public Transit (14-526 (a) 3), if applicable** • Existing available transit services • Proposed site plan design details, such as easement, pad base, and shelter
☑	☐	**Off-Street Parking: Vehicle & Motorcycle/Scooter) (14-526 (a) 4 a and c)** • Expected parking demand, proposed parking supply, ADA parking, and applicable Zoning Requirements • Address Technical Manual standards (Section 1) for curb cut separation and parking lot layout and locate on site plan
☑	☐	**Bicycle Parking (14-526 (a) 4 b)** • Address bicycle parking requirements and identify locations on-site • Construction details for bike racks (Technical Manual, Section 1)
☑	☐	**Snow Storage (14-526 (a) 4 d)** • Management plan for snow removal and locate snow storage areas on plan
☑	☐	**Traffic Demand Management (TDM) (14-526 (a) 5), if applicable** • Develop TDM with Trip Reduction Targets and Strategies

ENVIRONMENTAL AND LANDSCAPE FEATURES	
Yes ☐ NA ☑	**Preservation of Significant Natural Features (14-526 (b) 1), if applicable** • Trees, plants, habitats listed on State or Federal list of endangered or threatened • High and moderate value waterfowl and wading habitat • Aquifers on Casco Bay Islands • Waterbodies (including wetlands, watercourses, significant vernal pools and floodplains) • Proposed preservation areas and protection measures • Documentation from environmental consultants, determinations from applicable state agencies
Yes ☑ NA ☐	**Landscaping and Landscape Preservation (14-526 (b) 2 a)** • Preservation of trees and preservation within required zoning setbacks (Technical Manual, Section 4) • Protection measures of existing vegetation during construction • Protection measures within Shoreland Zone, if applicable
Yes ☑ NA ☐	**Site Landscaping (14-526 (b) 2 b)** • Screening and buffering of service areas and between non-residential and residential uses • Planting plans with plant schedule and sizes (Technical Manual, Section 4)
Yes ☑ NA ☐	**Parking Lot Landscaping (14-526 (b) 2 b ii), if applicable** • Landscaped islands within parking areas (Technical Manual, Section 4)
Yes ☑ NA ☐	**Street Trees (14-526 (b) 2 b iii)** • Existing Heritage or Feature Trees on site and measures to preserve • Identify street trees on the plan meeting the site plan and Technical Manual standards (Section 4) or identify alternative measures, if applicable
ENVIRONMENTAL AND STORMWATER	
Yes ☑ NA ☐	**Water Quality, Stormwater Management and Erosion Control (14-526 (b)3 a)** • Stormwater report in compliance with Section 5 of Technical Manual and DEP Chapter 500 stormwater for basic, general and flooding standards, as applicable • Erosion control plan and measures • Evidence of compliance with Urban Impaired Stream Standards pursuant to DEP Chapter 500 stormwater, as applicable • Subsurface sanitary sewage disposal and groundwater protection

PUBLIC INFRASTRUCTURE AND SAFETY	
Yes ☑ NA ☐	**Consistency with City Master Plans (14-526 (c) 1)** • Identify consistency with master plans • Proposed easements, rights and improvements to connect or continue off-premises public infrastructure, as applicable
Yes ☑ NA ☐	**Public Safety and Fire Prevention (14-526 (c))** • Address Crime Prevention through Environmental Design (CPTED) (Technical Manual, Section 3) • Emergency vehicle access • Address consistency with public safety standards (Technical Manual, Section 3) • Submit a code summary referring NFPA 1 and all Fire Department standards (Technical Manual, Section 3) – Fire Checklist
Yes ☑ NA ☐	**Availability and Adequacy of Public Utilities (14-526 (c) 3) (Technical Manual, Sections 2 & 9)** • Electrical services, including providing underground services • Identify existing and proposed connections for public utilities and required public utility upgrades • Sewer line connections are required, if there is a main within 200 feet • Proposed solid waste management facilities on-site and management for the site • Written evidence of the ability to serve from utility companies, as applicable
SITE DESIGN	
Yes ☑ NA ☐	**Massing, Ventilations and Wind Impact (14-526 (d) 1)** • Wind and ventilation impacts on adjoining structures and/or adjacent public spaces. Wind study, if applicable • Bulk, location or height impacts on adjoining structures • Identify and locate HVAC equipment and venting away from public spaces and residential properties • Identify screening and manufacturing specifications for noise, if applicable
Yes ☑ NA ☐	**Shadows (14-526 (d) 2), if applicable** • Shadow analysis of impacts on publicly accessible open space (Technical Manual, Section 11)
Yes ☑ NA ☐	**Snow and Ice Loading (14-526 (d) 3)** • Building design to prevent snow and ice from loading or falling onto adjacent properties or public ways
Yes ☑ NA ☐	**View Corridors (14-526 (d) 4), if applicable** • Protection of designated view corridors (Portland Design Manual, Appen. 1)

Yes ☐ NA ☑	**Historic Resources (14-526 (d) 5), if applicable** • Identify developments within Historic Districts or affecting Designated Landmarks • Certificate of Appropriateness or other evidence • Identify Developments within 100 feet of Historic Districts or affecting Designated Landmarks. Advisory HP review may be required • Address preservation and documentation of Archaeological Resources
Yes ☑ NA ☐	**Exterior Lighting (14-526 (d) 6)** • Cut sheets of on-site light fixtures and any architectural or specialty lights (Technical Manual, Section 12) • Engineered details for any lights proposed in street right-of-way (Technical Manual, Section 10)
Yes ☑ NA ☐	**Noise and Vibration (14-526 (d) 7)** • Evidence of noise levels for equipment, such as equipment specifications, to demonstrate consistency with zoning requirements
Yes ☑ NA ☐	**Signage and Wayfinding (14-526 (d) 8), if applicable** • Signage plan showing the location, dimensions, height and setback of all existing and proposed signs. Signs in Historic Districts are reviewed by Historic Preservation staff • Proposed commercial and directional signage on site
Yes ☑ NA ☐	**Zone Related Design Standards (14-526 (d) 5)** • Address Historic Preservation Design Review, if applicable • Address any applicable design review standards by zone • Address submission requirements from Design Manual, page 1, addressing neighborhood context • Description of exterior materials, color, finish, and samples
Construction Management Plan	
Yes ☑ NA ☐	**Construction Management Plan** • Construction Management Document and Plan

LEVEL II AND LEVEL III SITE PLAN
DRAWINGS CHECKLIST

Please upload the following DRAWINGS with the listed details into e-Plan as separate pdfs

RECENT BOUNDARY SURVEY (stamped by Maine Licensed Surveyor)

- [x] Must be in compliance with Technical Manual, Section 13

SITE PLAN(s) (stamped by Maine Licensed Engineer) including:

Existing Conditions

- [x] Approximate location of structures on abutting property
- [x] Topography
- [x] Locate water courses
- [ ] Delineate wetlands
- [x] Zone lines

Proposed Site Plan

- [x] Ground floor area, and grade elevations for all buildings

Access, Circulation, and Parking

- [x] Streets and intersections adjacent to site, any proposed geometric modifications
- [x] Location, dimensions and materials of all existing and proposed driveways, vehicle, bicycle, & pedestrian access ways with corresponding curb lines
- [x] Engineered specifications/ cross-sections for proposed driveways, sidewalks & paved areas
- [x] Location and dimensions of proposed loading areas
- [x] Existing and proposed transit infrastructure with dimensions/ engineering specifications
- [x] Location of vehicle and bicycle parking with dimensions and engineering specifications

Site Considerations

- ☑ Identify snow storage areas
- ☑ Location of fire hydrants
- ☑ Location of solid waste management facilities

UTILITY PLAN including:

- ☑ Existing utilities on site and within public streets
- ☑ Location, sizing and directional flows of all existing and proposed utilities
- ☑ Location and dimensions of off-premises public or publicly accessible infrastructure adjacent to site
- ☑ Electric utility infrastructure

GRADING AND DRAINAGE PLAN including:

- ☑ Existing grades and drainage
- ☑ Proposed grades
- ☑ Proposed stormwater management meeting Technical Manual (Section 5), standards
- ☑ Location and proposed alteration of a water course
- ☑ Preservation or alteration of wetlands

EROSION CONTROL

- ☑ Must be in compliance with Technical Manual, Section 5

LANDSCAPE PLAN including:

- ☑ Existing vegetation to be preserved and preservation measures
- ☑ Proposed landscaping and buffers
- ☑ Planting schedule

RECORDING PLAT, if applicable
☐ If Subdivision, must be in compliance with requirements of Section 14-496 (b)
ARCHITECTURAL PLANS AND RENDERINGS including:
☑ Exterior building elevations, color renderings, illustrations of all sides
☑ Location and dimensions of all existing and proposed HVAC and mechanical equipment, all proposed screening
☑ Provide context drawings, if applicable (Design Manual, page 1)
☑ Floor plans

GENERAL APPLICATION DOCUMENT

TECHNICAL CAPABILITY

The applicant has retained a highly qualified team of professionals to undertake planning, permitting and design tasks on this project. Services will be provided by the following companies and their respective team leaders:

Civil Engineer	Stephen Bushey, P.E. Gorrill-Palmer Consulting Engineers 707 Sable Oaks Drive South Portland, Maine 04106 (207) 772-2515 – Work sbushey@gorrillpalmer.com
Architect	SMRT Architects and Engineers 144 Fore Street Ste A Portland, Maine 04101 (207) 772-3846 Attn: Kristen Damuth, AIA, CSI KDamuth@smrtinc.com
Surveyor	Randy Loubier Owen Haskell, Inc. 390 US Route 1, Unit 10 Falmouth, ME 04105 (207) 774-0424 – Work (207) 774-0511 – Fax rloubier@ownehaskell.com
Traffic Engineer	Randy Dunton, P.E. Gorrill-Palmer Consulting Engineers 707 Sable Oaks Drive South Portland, Maine 04106 (207) 772-2515 – Work rdunton@gorrillpalmer.com
Geotechnical Consultant	Bryan Steinert, P.E. Haley & Aldrich, Inc. 75 Washington Ave, Ste 1A Portland, Maine 04101 (207)482-4600 BSteinert@haleyaldrich.com
Mercy Facilities	Nick Munro – Facility Project Manager Northern Light Healthcare 43 Witing Hill Road Brewer, ME 04412 (207)553-6633 nmunro@northernlight.org

The team of consultants retained has expertise and experience in the design of similar institutional projects. Resumes of key personnel for development team can be provided upon request.

GENERAL APPLICATON DOCUMENT

FINANCIAL CAPACITY

The Applicant has adequate financial resources to undertake this project as evidenced by the approved Certificate of Need notification issued by the Maine Department of Health and Human Services on April 17, 2019, a copy of which is attached. The following excerpt of the CON Unit response from DHHS outlines their findings:

> *"Based on the review of the applicant's financial projections and financial performance indicators, CONU believes the underlying assumptions regarding future performance are reasonable. Since Northern Light Health and the hospital members of the obligated group are jointly and severally obligated on the system's bonded indebtedness, CONU reviewed Eastern main Healthcare Systems (Now Norther Light) 2018 and 2017 consolidated financial statements and believes the sufficient financial resources exist to assist Mercy if financial projections are not realized. Due to Mercy's campaign and the proposed sale of the State Street facility additional debt has been minimized. CONU believes that the project is necessary Operating two campuses is simply not financially sustainable in the long term. Since the ability of the applicant to support the project financially over its useful life is heavily dependent on both inpatient and outpatient volume CONU is including the following condition:*
>
> **Condition:** *The applicant is to report inpatient discharge volume and outpatient encounter volume on an annual basis, within 90 days of its fiscal end, beginning with the time period when the Certificate of need was approved until a full three years have elapsed since the date of project completion."*

The estimated full cost of the project is $74.7 million; the certificate of need applicable capital cost is $63.1 million. Campus consolidation will reduce Mercy's current operating expenses by a net of $1.2 million annually following full implementation.

GENERAL APPLICATION DOCUMENTS

RIGHT, TITLE & INTEREST

Northern Light Mercy Hospital owns the property as evidenced in the accompanying deeds. Mercy currently is entered into a lease agreement with HCRI Fore River Medical Facilities LLC as they own the medical office building. Mercy has also previously transferred approximately 1.48 acres of land to the Maine Department of Transportation for the construction of the Fore River Parkway and the Veterans Memorial Bridge. The purchase deeds held by Mercy Hospital are included at the end of this section.

EASEMENT DEED

The **STATE OF MAINE**, by its Department of Transportation, with offices in Augusta, Maine ("Grantor"), for consideration paid, grants to **MERCY HOSPITAL**, a Maine non-profit corporation with a mailing address of 144 State Street, Portland, Maine 04101-3795 ("Grantee"), its successors and assigns, for the benefit of and appurtenant to certain lots or parcels of land, situated in the City of Portland, County of Cumberland and State of Maine, as described in a deed from Merrill Industries, Inc. to Mercy Hospital dated October 9, 2002 and recorded in the Cumberland County Registry of Deeds in Book 18203, Page 128 and in a deed from Portland Terminal Company to Mercy Hospital dated June 26, 2002 and recorded in said Registry of Deeds in Book 17783, Page 289 (collectively "Grantee's Property"), an easement, in common with the Grantor herein, located in the City of Portland, County of Cumberland and State of Maine, and more particularly bounded and described as follows:

This Easement shall include the perpetual right to flow water through drainage structures, including, but not limited to, storm sewer outlet pipes, catch basins, and outlet ditches ("Drainage Structures") installed or to be installed by Grantor, under or adjacent to State Highway "10" as shown on a plan entitled "Right-of-Way Map, State Highway "10", City of Portland, Federal Aid Project No. TCSP-7589 (200)X, (PIN 007589.20), dated September 2002" as revised on file in the office of the Department of Transportation, (D.O.T. File No. 3-483) to be recorded in the Cumberland County Registry of Deeds ("Right of Way Map"), together with the perpetual right to flow water under and across State Highway "10" and to connect to and use any and all Drainage Structures installed by Grantor, whether located inside or outside the bounds of State Highway "10", for the purpose of flowing water from Grantee's Property located easterly of said State Highway "10" to Grantee's Property located westerly of said State Highway "10", in the locations shown generally on the Right of Way Map as follows:

Type	**Location**	**Direction of Flow**
Storm Sewer Outlet Pipe	Sta. 1+010.4 to Sta. 1+082 (approximately)	Northwesterly

That portion of the Storm Sewer Outlet Pipe located between Station 1+010.4 (approximately) and Station 1+026.2 (approximately) is located on a portion of Grantee's Property and is to be used in common between the Grantor and Grantee.

Storm Sewer Outlet Pipe	Sta. 1+360.5 to Sta. 1+392 (approximately)	Northwesterly
Storm Sewer Outlet Pipe	Sta. 1+528.0 to Sta. 1.534.7 Rt.	Southwesterly

Those portions of the Storm Sewer Outlet Pipe located between Station 1+528.0 and Station 1+534.7 and lying easterly of and westerly of said State Highway "10" are located on a portion of Grantee's Property and are to be used in common between the Grantor and Grantee.

Being a portion of the premises described in the Notice of Layout and Taking dated November 11, 2002 and recorded in the Cumberland County Registry of Deeds in Book 19154, Page 155.

The STATE OF MAINE has caused this instrument to be signed by David A. Cole, Commissioner of the Department of Transportation, thereunto duly authorized, this 5 day of January 2005.

DECLARATION OF COVENANTS AND RESTRICTIONS

THIS DECLARATION OF COVENANTS AND RESTRICTIONS is made this 29th day of October, 2007, by Mercy Hospital, a nonprofit corporation having a place of business located in the City of Portland, County of Cumberland, State of Maine (herein referred to as the "Declarant"), pursuant to State of Maine Department of Environmental Protection (hereinafter "DEP") Permit Numbers L-20775-19-A-N and L-20775-TG-B-N, dated June 26, 2002, and recorded in Book 17869, Page 165 at the Cumberland County Registry of Deeds (hereinafter referred to as the "Order"), relating to preservation of land near the Fore River in the City of Portland, State of Maine.

RECITALS

WHEREAS, Declarant holds title to certain real property situated in Portland, Maine pursuant to a deed from Portland Terminal Company dated June 26, 2002, and recorded in Book 17783, Page 289 at the Cumberland County Registry of Deeds, and a deed from Merrill Industries, Inc., dated October 9, 2002 and recorded in Book 18203, Page 128 at said Registry of Deeds (the "Hospital Premises"); and

WHEREAS, Declarant desires to place certain deed covenants, under the terms and conditions herein, over a portion of the Hospital Premises (such portion being hereinafter referred to as the "Covenant Area"), which Covenant Area is described in Exhibit A attached hereto.

WHEREAS, pursuant to the Natural Resources Protection Act, Title 38 M.R.S.A. Section 480-A et seq. and Chapter 310 of regulations promulgated by the DEP (the "Wetland Protection Rules"), Declarant has agreed, in satisfaction of Condition 7 of the Order, to impose certain covenants and restrictions on the Covenant Area as more particularly set forth herein and has agreed that such covenants and agreements may be enforced by the DEP or any successor in interest.

NOW, THEREFORE, Declarant hereby declares that the Covenant Area is and shall forever be held, transferred, sold, conveyed, occupied, and maintained subject to the covenants, conditions, and restrictions set forth in Section 1 below (sometimes referred to as the "Covenants and Restrictions"). The Covenants and Restrictions shall run with the Covenant Area and shall be binding on all parties having any right, title, and interest in and to the Covenant Area, or any portion thereof, and their heirs, personal representatives, successors, and assigns. Any present or future owner or occupant of the Covenant Area or any portion thereof, by the acceptance of a deed of conveyance of all or part of the Covenant Area or an instrument conveying any interest

therein, whether or not the deed or instrument shall so express, shall be deemed to have accepted the Covenant Area subject to the Covenants and Restrictions and shall agree to be bound by, to comply with, and to be subject to each and every one of the Covenants and Restrictions hereinafter set forth.

1. Restrictions on Covenant Area. Unless the Declarant of the Covenant Area, or its successors or assigns, obtains the prior written approval of the DEP (or any successor thereof), and with the exception of normal maintenance activities that can be performed by hand and will disturb minimal amounts of vegetation, the Covenant Area shall remain undeveloped in perpetuity. In furtherance of such restriction, the following specific covenants and restrictions shall apply to the Covenant Area:

a. no snow, soil, loam, peat, sand, gravel, concrete, rock, or other mineral substance, refuse, trash, vehicle bodies or parts, rubbish, debris, junk waste, pollutants, or other fill material will be placed, stored, or dumped on the Covenant Area and the surface waters contained thereon, nor shall the topography of the area be altered or manipulated in any way other than by forces of nature;

b. no trees, grasses, shrubs, vines, or other vegetation shall be cut, destroyed, or sprayed with biocides, except that (i) de minimis flower picking shall be allowed, (ii) pruning will be allowed solely to maintain a clear pathway on any path or trail, and (iii) dead wood that is leaning, fallen, or presents a safety hazard may be removed;

c. no ditches shall be dug in the Covenant Area and, other than by forces of nature, no draining of the Covenant Area shall take place, no pumping or any other removal of water shall occur on the Covenant Area, and no manipulation or alteration of natural water courses or hydrology within the Covenant Area shall be permitted;

d. no building, sign, fence, utility pole, or other temporary or permanent structure will be constructed, placed, or permitted to remain on the Covenant Area;

e. no trucks, cars, dirt bikes, ATVs, bulldozers, backhoes, or other motorized vehicles or mechanical equipment shall be permitted on the Covenant Area; and

Any activity on or use of the Covenant Area inconsistent with the purpose of these Covenants and Restrictions is prohibited. Prior to undertaking any changes in the use of the Covenant Area, the Declarant, its successors and assigns, shall consult with the DEP regarding the proposed changes to determine the effect of such changes on the conservation values of the Covenant Area. The DEP shall have the right to approve such changes in use if such uses do not impair or impede the conservation values of the Covenant Area or the purpose of the Covenants and Restrictions.

2. Enforcement. The DEP may enforce any of the Covenants and Restrictions set forth in Section 1 above. Any future alterations of the Covenant Area must receive the prior approval in writing from the DEP, except as expressly permitted in Section 1 above.

3. Binding Effect. The restrictions set forth herein shall be binding on the Declarant and any future owner of the Covenant Area. If the Covenant Area is at any time owned by more than one owner, each owner shall be bound by the foregoing restrictions but only to the extent that any of the Covenant Area is included within such owner's property.

4. Amendment. Any provision contained in this Declaration may be amended or revoked only by the recording of a written instrument or instruments specifying the amendment or the revocation signed by the owner or owners of the Covenant Area and by the DEP (or any successor thereto).

5. Effective Provisions of Declaration. Each provision of this Declaration, and any agreement, promise, covenant, and undertaking to comply with each provision of this Declaration, shall be deemed a covenant running with the land as a burden and upon the title to the Covenant Area.

6. Severability. Invalidity or unenforceability of any provision of this Declaration in whole or in part shall not affect the validity of enforceability of any other provision or any valid and enforceable part of a provision of this Declaration.

7. Governing Law. This Declaration shall be governed by and interpreted in accordance with the laws of the State of Maine.

RECREATIONAL TRAIL EASEMENT

MERCY HOSPITAL, a nonprofit corporation located in the City of Portland, County of Cumberland, and the State of Maine (hereinafter referred to as "Grantor"), GRANTS, as a gift to PORTLAND TRAILS, a Maine nonprofit corporation (hereinafter referred to as "Holder"), in perpetuity, the following described Recreational Trail Easement (hereinafter referred to as "Easement"), over the "Property" as more fully described below.

Recitals

A. Grantor owns a parcel of land located along the Fore River in the City of Portland, State of Maine, as more particularly described in **Exhibit A** attached hereto and made a part hereof (the "Property").

B. In order to comply with the requirements of Paragraph 6 of the Contract Zone Agreement Between City of Portland and Mercy Hospital and Mercy Health System of Maine (hereinafter referred to as the "Contract Zone Agreement"), Grantor has agreed to grant Holder an Easement in perpetuity over the pedestrian paths and bicycle paths on the Property.

C. This Easement is established pursuant to Title 33 Maine Revised Statutes Annotated Section 1581, et. seq.

NOW THEREFORE, Grantor establishes this Easement on, over, and across the Property as follows:

1. Recreational Purpose. This Easement is for the purpose of providing the general public the right to use certain trails on the Property for pedestrian and bicycle uses.

2. Easement. Grantor hereby grants to Holder a perpetual easement in gross, in common with Grantor and others, for pedestrian and bicycle use by the general public of those trails on the Property as particularly depicted on the "Recreational Trail Easement Plan" attached as **Exhibit B** and incorporated herein. Reserving to Grantor the right to make minor modifications to the location of the trails shown on the Recreational Trail Easement Plan, subject to the review and approval of the Holder and provided that Grantor shall be obligated to obtain all necessary permits and approval for such modifications.

3. Signage. Grantor shall install and maintain trail signs directing the general public to the trail location provided for by this Easement. Such signage shall be of a type, number and location approved by Holder.

4. Rules.

(a) With respect to the Easement granted herein, use by the general public shall be limited to daylight hours only and use by the general public shall be limited to recreational activities only.

(b) This Easement does not permit the general public or anyone other than Grantor to use the Easement for commercial, political or any other non-recreational activities on the Property, including, without limitation, soliciting, demonstrating or picketing, even if such activities are conducted simultaneously with, or as part of an otherwise permitted recreational activity and Holder acknowledges and agrees that Grantor may take action to prohibit such activities on the Property without additional consent of Holder.

(c) Grantor reserves the right to establish additional rules from time to time regarding the use of all such trails, which rules are subject to the review and prior written approval of the Holder. Grantor reserves the right to prohibit animals from some or all of the trails subject to this Easement.

(d) Either Grantor or Holder may enforce these rules, but Holder shall have no obligation to enforce these rules. Both Grantor and Holder acknowledge that this Easement is established for public use of the trails, on foot or by bicycle without charge, and Grantor and Holder agree to take no action to prohibit, discourage or charge a fee for public access to and use of the trails during daylight hours, except in compliance with the terms of this Easement.

5. Grantor acknowledges and agrees that it shall be responsible for obtaining all necessary permits or consents from the City of Portland for any amendment to this Easement and for any relocation of the trails shown on the Recreational Trail Easement Plan.

6. Holder, or its duly authorized agents, shall have the right to access the trails shown on the Recreational Trail Easement Plan by foot or by vehicle for the purpose of monitoring or inspecting said trails. The Grantor, its successors and assigns, shall be responsible for any and all costs associated with ownership, control, operation, maintenance, and upkeep of the trails.

7. The parties acknowledge and agree that this Easement is for "recreational activities" as such term is defined in 14 M.R.S.A. § 159-A(1)(B) and that Grantor and Holder shall be entitled to the liability protection set forth in such statute.

8. In the event the Holder shall cease to exist or shall cease to be willing or able to hold this Easement, then Holder shall assign this Easement to either (a) an entity that is a publicly supported, non-profit 501(c) (3) organization with a substantially similar purpose as Holder, which entity must be approved by the City of Portland, Maine or (b) the City of Portland, Maine.

9. Upon a written request from Holder, Grantor shall grant to Holder an additional easement to extend that portion of the trail located in the "North Open Space" on the Recreational Trail

Easement Plan from the "End Of Trail" in a northerly or northwesterly direction (as designated by Holder) to the boundary of the Property. The purpose of such extension will be to connect such trail to another trail located outside of the Property, and such extension of the easement will be subject to all other terms and conditions set forth herein.

10. The failure or delay of the Holder, for any reason whatsoever, to do any action required or contemplated hereunder, or to discover a violation or initiate an action to enforce this Easement shall not constitute a waiver, laches, or estoppel of its rights to do so at a later time.

11. Only Holder and Grantor may bring an action to enforce this grant, and nothing herein should be construed to grant any other individual or entity standing to bring an action hereunder, unless otherwise provided by law.

12. The interpretation and performance of this Easement shall be governed by the laws of the State of Maine. Except with respect to Section 4(b), which shall be liberally construed in favor of Grantor's right to prohibit non-recreational activities on the Property (a) any general rule of construction to the contrary notwithstanding, this Easement shall be liberally construed in favor of the grant to effect the recreational purpose of this Easement; and (b) if any provision in this instrument is found to be ambiguous, an interpretation consistent with the recreational purposes of this Easement shall govern.

IN WITNESS WHEREOF, MERCY HOSPITAL, has caused these presents to be signed and sealed in its corporate name by Eileen F. Skinner, its President, hereunto duly authorized, this 28th day of February 2008.

PARCEL I

A certain lot or parcel of land with buildings thereon situated on the northerly side of the Blue Star Memorial Highway (Route #1) at the Veteran's Memorial Bridge on the Fore River in the City of Portland, County of Cumberland and State of Maine as shown on a plan entitled "Land in Portland, ME. Portland Terminal Company to Mercy Hospital", Sale: 1: = 100', dated June 29, 2001, as amended to date, by Owen Haskell, Inc., which plan is recorded in the Cumberland County Registry of Deeds at Plan Book 202, Page 431 (the "Conveyancing Plan"), which lot or parcel of land is bounded and described as follows:

Commencing at a rod marking a point 50.00' westerly of and at right angles to the center line of the main track marking a P.C. Station of 23 + 11.35 as shown on right of way and track map Portland Terminal Company dated June 30, 1916 revised March 1938 filed in the Portland Terminal Company in V1-D over 1-A; Said rod being approximately 675' northerly of the northerly right of way line of said Route #1;

Thence northerly along land of Portland Terminal Company and being 50.00' westerly of the centerline of said main track, N 10° 46' 19" W a distance of 482.85' to a rod opposite station 18 + 28.50;

Thence continuing along land of Portland Terminal Company and being 50.00' westerly of the centerline of said main track N 10° 57' 07" W a distance of 290.08' to a rod opposite station 15 + 38.42;

Thence continuing along land of Portland Terminal Company N 9° 29' 00" W a distance of 197.09' to a rod marking the westerly right of way line for the existing spur track and being 33.00' westerly and opposite P.C. Station 2 + 00.64' as shown on said railroad plan;

Thence continuing along land of Portland Terminal Company and being along said right of way line of said spur track along a curve to the left whose radius is 922.37', an arc distance of 185.63' to a rod on the westerly edge of a paved drive, said rod being found on a chord of N 22° 33' 26" W a distance of 185.32' and said rod being the Point of Beginning;

Thence continuing along land of Portland Terminal Company and following the westerly edge of said paved drive S 9° 2' 42" W a distance 110.67' to a rod';

Thence continuing along land of Portland Terminal Company on the following courses:

N 78° 59' 25" W a distance of 42.80' to a rod;

S 10° 55' 38" E a distance of 580.68' to a rod, said rod being 160.00' westerly of and at right angles to the centerline of the main track opposite said Station 18 + 28.50';

S 78° 59' 25" W a distance of 446.63 feet to a tie point;

Continuing S 78° 59' 25" W a distance of 133' ± to the easterly bank of the Fore River and continuing to the approximate low water line a total distance of 1165' ±;

Thence northerly, northwesterly, westerly, northeasterly and southwesterly following the approximate low water line a distance of 2550' ± to the easterly right of way line of Route 295;

Thence N 17° 19' 15" E along said right of way line 760' ±;

Thence N 50° 25' 55" E along said right of way line 176.00 feet;

Thence easterly along said right of way line and along a curve to the left whose radius is 375.00', an arc distance of 7.14' to a point and the southwesterly right of way line for the existing spur track and land of Portland Terminal Company, said point being found on a chord of S 84° 55' 24" E a distance of 7.14';

Thence S 54° 28' 52" E along land of Portland Terminal Company 116.36';

Thence southeasterly along said land and a curve to the left whose radius is 988.44' an arc distance of 283.21 to a tie point, said tie point being located the following courses and distance from the aforementioned tie point:

N 36° 35' 47" W 23.62';
N 36° 20' 10" W 1202.64';
N 41° 38' 20" W 452.20 and said tie point being found on a chord of
S 62° 42' 17" E a distance of 282.24';

Thence continuing southeasterly and easterly along said land and a curve to the left whose radius is 988.37' an arc distance of 247.17' to a point said point being found on a chord of S 78° 04' 38" E a distance of 246.53';

Thence S 85° 15' 29" E along said land 439.84';

Thence continuing southeasterly along said land and a curve whose radius is 922.37', an arc distance of 1102.20' to the Point of Beginning, said point being found on a chord of S 51° 01' 30" E, 1037.78'.

Above courses are grid north.

Meaning and intending to describe that certain parcel of land identified as the "Portland

Terminal Parcel" on the Conveyancing Plan.

PARCEL II

A certain lot or parcel of land with buildings thereon situated on the northerly side of the Blue Star Memorial Highway (Route #1) at the Veteran's Memorial Bridge on the Fore River in the City of Portland, County of Cumberland and State of Maine as shown on a plan entitled "Land in Portland, ME. Portland Terminal Company to Mercy Hospital", Sale: 1: = 100', dated June 29, 2001, as amended, by Owen Haskell, Inc., which plan is recorded in the Cumberland County Registry of Deeds at Plan Book 202, Page 431 (the "Conveyancing Plan"), which lot or parcel of land is bounded and described as follows:

Beginning at a rod marking a point 50.00' westerly of and at right angles to the center line of the main track marking a P.C. Station of 23 + 11.35 as shown on right of way and track map Portland Terminal Company dated June 30, 1916 revised March 1938 filed in the Portland Terminal Company in V1-D over 1-A; Said rod being approximately 675' northerly of the northerly right of way line of said Route #1;

Thence northerly along land of Portland Terminal Company and being 50.00' westerly of the centerline of said main track, N 10° 46' 19" W a distance of 482.85' to a rod opposite station 18 + 28.50;

Thence continuing along land of Portland Terminal Company and being 50.00' westerly of the centerline of said main track N 10° 57' 07" W a distance of 290.08' to a rod opposite station 15 + 38.42;

Thence continuing along land of Portland Terminal Company N 9° 29' 00" W a distance of 197.09' to a rod marking the westerly right of way line for the existing spur track and being 33.00' westerly and opposite P.C. Station 2 + 00.64' as shown on said railroad plan;

Thence continuing along land of Portland Terminal Company and being along said right of way line of said spur track along a curve to the left whose radius is 922.37', an arc distance of 185.63' to a rod on the westerly edge of a paved drive, said rod being found on a chord of N 22° 33' 26" W a distance of 185.32';

Thence continuing along land of Mercy Hospital described in that certain deed given by Portland Terminal Company dated June 26, 2002 and recorded in the Cumberland County Registry of Deeds in Book 17783, Page 289, shown on the Conveyancing Plan as the "Portland Terminal Parcel" and following the westerly edge of said paved drive S 9° 2' 42" W a distance 110.67' to a rod;

Thence continuing along said land of Mercy Hospital on the following courses:

N 78° 59' 25" W a distance of 42.80' to a rod;

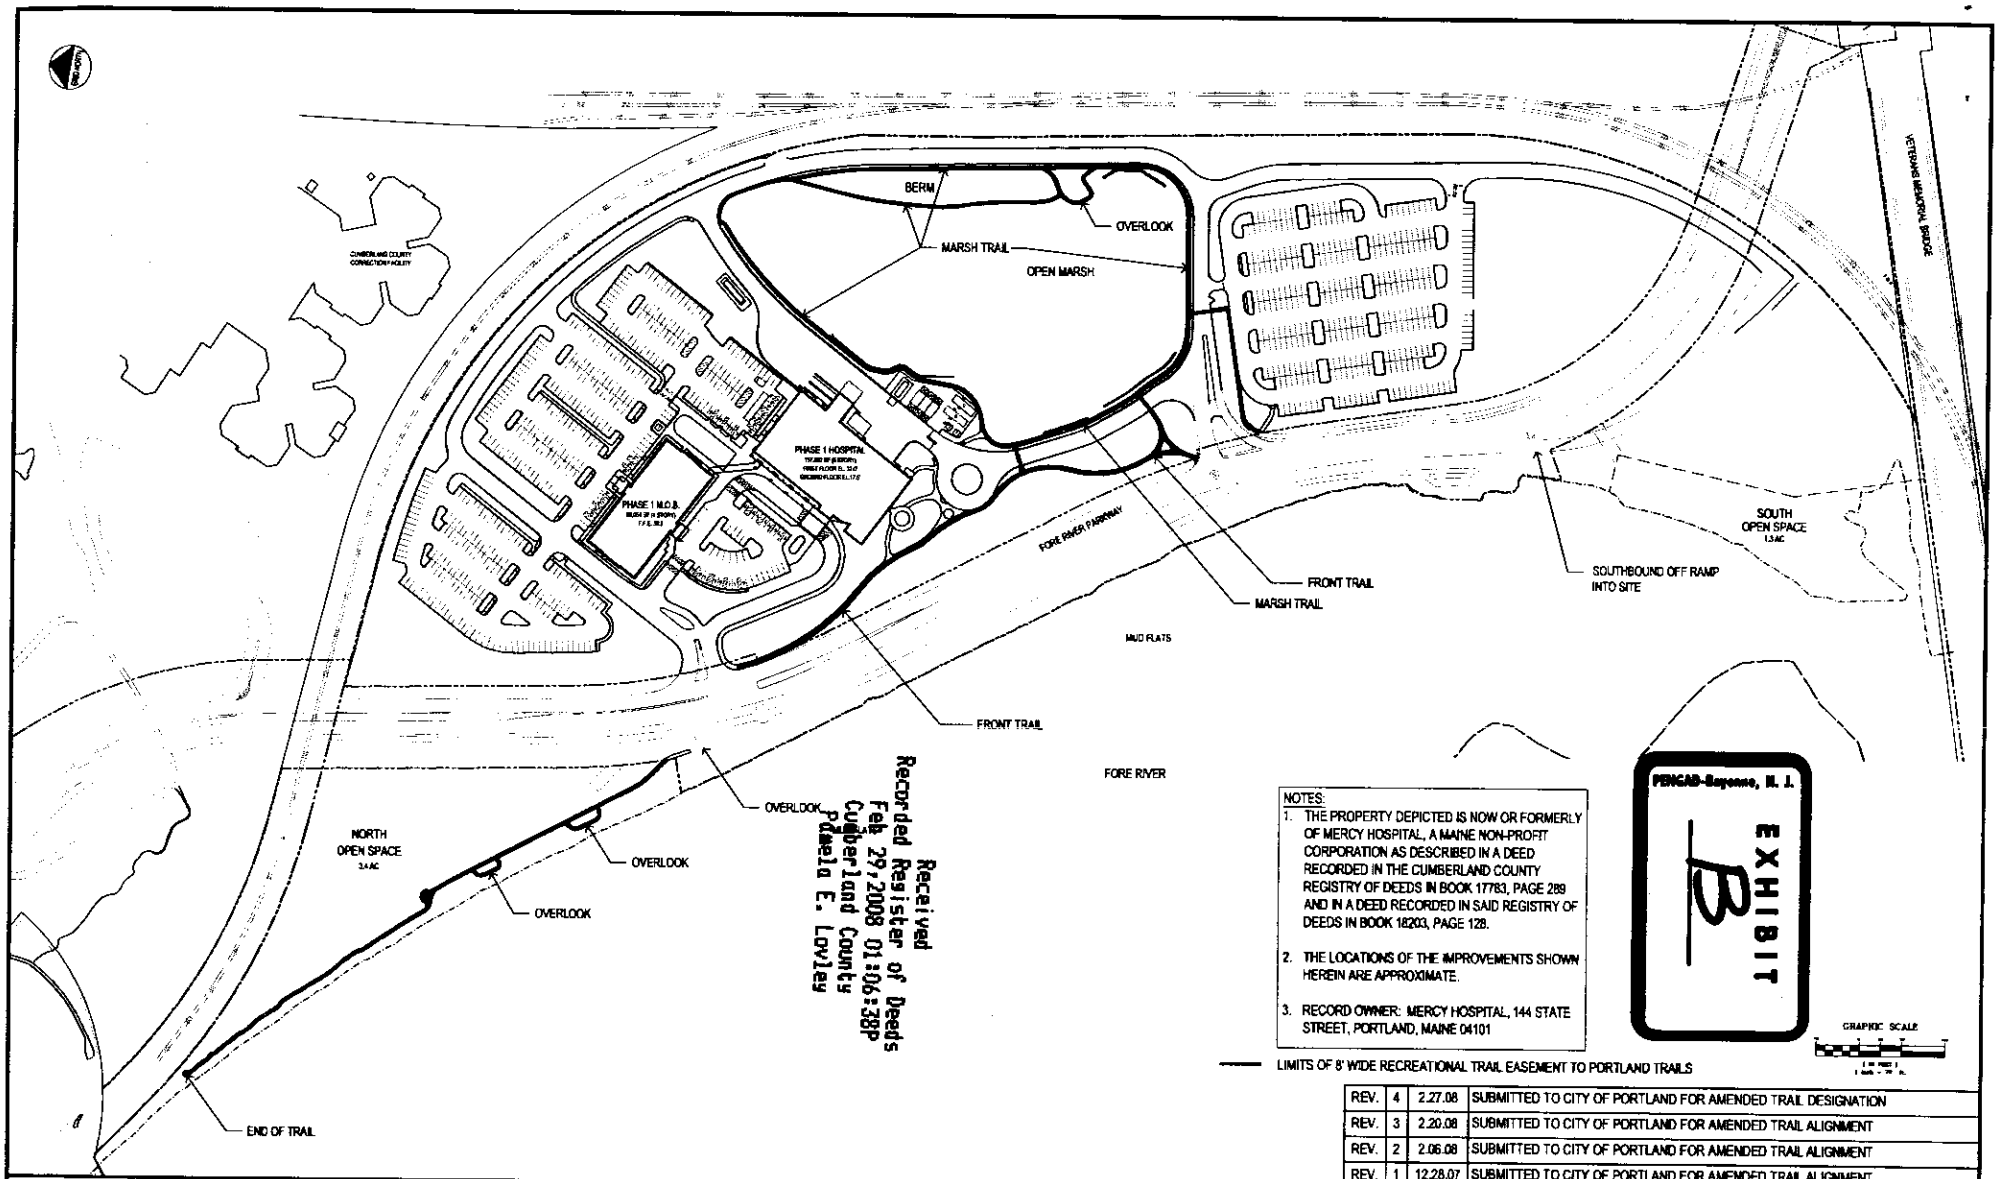
S 10° 55' 38" E a distance of 580.68' to a rod, said rod being 160.00' westerly of and at right angles to the centerline of the main track opposite said Station 18 + 28.50';

S 78° 59' 25" W a distance of 446.63 feet to a tie point;

Continuing S 78° 59' 25" W a distance of 133' ± to the easterly bank of the Fore River and continuing to the approximate low water line a total distance of 1165' ±;

Thence along a southerly, easterly, southerly, easterly and westerly line following the approximate low water line a distance of 1800' ± to the northerly right of way line of said Route #1;

Thence by the northerly right of way line of said Route #1 N 71° 56' 20" E a distance of 455' ± to the easterly bank of said Fore River;



Thence continuing by said northerly right of way line of Route #1 on same course of N 71° 56' 20" E a distance of 125.37' to a tie point, said tie point being located the following courses and distances from the aforementioned tie point: S 9° 02' 28" E 1006.02 and S 16° 59' 00" W 273.21;

Thence continuing by said northerly right of way line of Route #1 on same course of N 71° 56' 20" E a distance of 244.63' to a point being 50.00' northerly of the centerline of said main track and opposite Station 32 + 86.66, at the intersection of a non-tangent curve;

Thence continuing along land of Portland Terminal Company along a curve to the left whose radius is 831.95' an arc of 920.02' whose chord is N 21° 53' 19" E 873.85 to the point of beginning.

Above courses are grid north.

Meaning and intending to describe that certain parcel of land identified as the "Merrill Parcel" on the Conveyancing Plan, and further meaning and intending to describe that certain parcel of land described in the deed of Portland Terminal Company to Merrill Industries, Inc. ("Merrill") dated July 27, 1998 and recorded in the Cumberland County Registry of Deeds at Book 14022, Page 302 (the "Merrill Deed").

RECREATIONAL TRAIL EASEMENT PLAN

FIGURE 1

Doc#: 10512 Bk:25855 Pg: 261

FIRST AMENDMENT TO RECREATIONAL TRAIL EASEMENT

THIS FIRST AMENDMENT TO RECREATIONAL TRAIL EASEMENT (this "Amendment") is made and entered into as of this 17th day of September 2008, by and between **MERCY HOSPITAL,** a Maine nonprofit corporation located in the City of Portland, State of Maine ("Mercy"), and **PORTLAND TRAILS**, a Maine nonprofit corporation located in the City of Portland, State of Maine.

RECITALS:

A. Mercy owns certain parcel of land located along the Fore River in the City of Portland, State of Maine, as more particularly described in Exhibit A to the "Recreational Trail Easement" (defined below) (the "Mercy Property").; and

B. In connection with the development of the Mercy Property, Mercy conveyed to Portland Trails certain recreational easements over the Mercy Property, all as more particularly described in the Recreational Trail Easement, dated February 28, 2008 and recorded in the Cumberland County Registry of Deeds in Book 25855, Page 253 (the "Recreational Trail Easement"); and

C. The parties now wish to amend Exhibit B to the Recreational Trail Easement to reflect minor modifications to the locations of the trails.

NOW, THEREFORE, for valuable consideration and the covenants and agreements hereinafter set forth and in furtherance of the parties' understanding, it is agreed as follows:

1. Attached hereto as **EXHIBIT B** is an Amended and Restated Recreational Trail Easement Plan, prepared by Deluca-Hoffman Associates, Inc., dated November 20, 2007 and revised August 28, 2008 (the "Revised Recreational Trail Plan") that reflects the as-built locations of the trails on the Mercy Property. The parties agree that said Revised Recreational Trail Plan hereby replaces and supersedes the Recreational Trail Easement Plan attached to the Recreational Trail Easement as **EXHIBIT B** (the "Original Recreational Trail Plan").

2. Portland Trails hereby RELEASES to Mercy any and all easement rights it has as to the trails shown on the Original Recreational Trail Plan. Mercy hereby GRANTS to Portland Trails easements over the trails shown on the Revised Recreational Trail Plan in accordance with

the terms and conditions set forth in the Recreational Trail Easement as modified by this Amendment.

3. Except as expressly set forth in this Amendment, all other terms and conditions of the Recreational Trail Easement shall remain in full force and effect and are hereby ratified by the parties.

IN WITNESS WHEREOF, the Parties have hereunto set their hands and seals as of the date first set forth above.

GENERAL APPLICATON DOCUMENT

PROJECT DESCRIPTION

PROJECT OVERVIEW

Background and Purpose of the Move to the Fore River Campus

Northern Light℠ Mercy Hospital (Mercy) is an acute care, non-profit hospital located in Portland, ME and is licensed for 200 in-patient beds. Mercy has over 1,604 employees, 743 medical staff, and over 125 volunteers. Mercy has served the greater Portland community for over 100 years opening its current 144 State Street Campus in 1943. In the early 2000s, Mercy Hospital's strategic plan identified important objectives that could not be achieved at the 3.5-acre State Street site, given its age, size, location and Portland's Historic District constraints. Four priority objectives of the strategic plan are listed below and represent the purpose for which the Fore River project was conceived and implemented:

- ***Mercy must assure "state of the art" technological infrastructure*** consistent with industry norms and standards of care;
- ***Mercy must assure short-term and long-term excellence*** in program plans and facilities to support them;
- ***Mercy must assure strong physician relationships*** enhanced by improved facilities; and
- ***Mercy must solidify itself as a health care employer of choice*** by providing safe, comfortable, and technologically advanced facilities.

When it became apparent that the State Street facility could not meet important strategic goals, Mercy engaged a technical team to work with the Hospital's management and Board to find a new location. The team developed six criteria for evaluating prospective sites:

- A 50-acre parcel was the goal for siting a new facility with 25 acres being the minimum;
- Easy accessibility from interstate highways and major roadways;
- Easy accessibility to public transportation;
- Convenient to doctor's offices, many of which are located on the Portland peninsula;
- Proximity to Maine Medical Center to avoid duplication of highly specialized equipment; and
- A site where Mercy would be welcomed by the neighborhood and the community at large.

Selection of the Fore River Site

Finding a location that satisfied all criteria was difficult. Three dozen potential locations were identified and reviewed. Of those, only the Fore River site met all six criteria. The City of Portland Planning and Economic Development Department endorsed the Fore River site, as did the Maine Department of Environmental Protection (MDEP) as evidenced by the granting of Permit Approvals L-20775-A-A-N & L-20775-TG-B-N and subsequent amendments.

The Fore River site was formerly owned by Merrill Industries and the Portland Terminal Co. and contained multiple sets of railroad tracks that were used to store railcars. The combined 85.5-acre parcel consisted of 43.5 acres of tidal mudflats and 42 acres of undeveloped land above the mudflats. Four wetland areas totaling over four acres were present in the upland area. Three small linear wetland areas were located within former drainage ditches along old railroad track paths. The fourth and largest wetland was a 3.6-acre former gravel pit that had been excavated to below the groundwater table to provide gravel for the original Veterans Memorial Bridge and for railroad operations. At the time that Mercy acquired the land in 2001, the former gravel pit contained numerous homeless encampments and a common dumping ground for trash and solid waste.

Mercy originally retained a team of hospital planning architects and consultants to develop an initial Master Plan for the Fore River parcel. Numerous development layouts were refined over time as Mercy's understanding of the site's existing conditions and development programming became known. The selected design layout in 2002 reduced the proposed wetland impacts to 0.92 acres, which involved the filling of three former rail line drainage ditches which were considered of low value, however it avoided filling in the former gravel pit. A MDEP Site Location Permit and Natural Resources Permit were issued for the site in 2002. Similarly, the City of Portland approved a Contract Zone Agreement in 2002, whereby allowing the proposed Hospital use; the site's original zoning was Industrial and Hospital, and medical offices are not an allowed use in the City's Industrial zones. During that same period, the Maine Department of Transportation undertook the construction of the Fore River Parkway connection from Congress Street and the Transportation terminal to West Commercial Street. Mercy's willingness to work with State and Local officials and agreement to transfer a portion of their land to allow the road construction was instrumental in the Parkway and Fore River Trail construction in 2004.

In 2005, Mercy submitted a Certificate of Need Application (CON) Application which proposed relocating part of its services to a new Fore River Campus (Phase 1). This CON Application was granted in 2005 and in 2008 Mercy opened a medical office building and a new hospital providing inpatient and outpatient surgical services, diagnostic imaging, laboratory, and obstetrics on the Fore River campus. Phase 1 design plans were developed from 2004 through 2006 following the CON approval. The Portland Planning Board reviewed and approved the Phase 1 Site plan and an overall Master Plan for the site in 2006 and in September 2006 the Phase 1 construction commenced. The Phase 1 program maintained resource impacts to the originally permitted 0.92 acres, thus avoiding any significant impacts to the former gravel pit wetland located in the middle of the site. The Phase 1 program, consisting of the 138,099 SF Hospital and 82,186 Medical Office Building, was completed and opened in September 2008.

Status of the Two-Phase Move to the Fore River Campus

Mercy chose to relocate from their State Street site and move to the Fore River campus in order to meet important strategic obligations and maintain appropriate standards of care that were in jeopardy long-term if the Hospital were to remain at State Street. A two-phase move was planned due to various circumstances. The first phase of the move to the Fore River campus was completed in 2008 with the construction of the Phase 1 hospital facility and the adjoining medical office building (MOB). At the Fore River site, ancillary facilities including surface parking for 762 vehicles, utilities, snow storage, and a maintenance building were also constructed. The Phase 2 planning effort has also continued since that time. In Mercy's 2005 Certificate of Need (CON), the Master Facility Plan anticipated future consolidation

of inpatient and ambulatory services on the Fore River Campus. Northern Light℠ Mercy Hospital Leadership have determined that the time is right to proceed with the phase two-development proposal.

In the eleven-year period that the Hospital has been maintaining both the State Street campus and the Fore River campus, Mercy has become acutely aware of the operational and financial problems of maintaining two interdependent campuses. In 2013 Mercy, joined EMHS (now Northern Light Health) and embarked upon a strategic repositioning initiative to achieve operational and financial efficiencies. The recently approved CON Application[1] (Phase 2), proposes to relocate all hospital services at State Street to the Fore River Campus.

The location of the Phase 2 hospital expansion has not changed from previous permitting. The current Phase 2 hospital build-out is projected to incorporate 54,889 SF of hospital space along with approximately 34,987 SF for an Ambulatory Surgical Center (ASC) to be separate from the hospital.

The useable portion of the original 42-acre Fore River property has shrunk over time. The Fore River Parkway and the final grading of the Phase 1 property have constricted expansion opportunities toward the river on the west. Construction of the new Veterans Memorial Bridge has further constrained the south end of the site. All major utility entries, hospital gas, and emergency generators are optimally located immediately south of the Phase 1 hospital, to service the intended Phase 2 expansion, but they restrict development in the southwest portion of the site. The Mercy Team has determined that there is approximately less than 20 acres of developable land remaining at the Mercy Fore River site, as shown on Figure 1 following this section.

In 2013, Mercy approached the Maine Department of Environmental Protection and the US Army Corps of Engineers with a long-term plan for the Hospital needs on the Campus. This involved the expansion of building(s) and parking facilities that encompass filling of the former gravel pit entirely. Based on the long-term plans and supporting evidence, both the MDEP and the USACOE approved Mercy's development plans. Both agencies accepted as compensation for the impacts to the basin resource, Mercy's participation in the In-Lieu Fee Compensation program[2]. Mercy has provided a contribution of $834,156 to the State to satisfy the NRPA condition of approval, thus establishing their standing to move ahead with filling the former gravel pit.

PURPOSE AND NEED

The fundamental reasons for the campus consolidation are:

- Improved access to the full range of healthcare delivery services on one campus;
- Improved Clinical and administrative Staff efficiencies;
- Improved patient experience in single patient rooms and ambulatory services;
- Reduction in annual operating costs will be achieved; and
- Continue high quality service delivery in one efficient modern facility.

[1] See https://www.maine.gov/dhhs/dlc/c_o_n/2019/index.shtml
[2] See https://www.maine.gov/dep/land/nrpa/ILF_and_NRCP/index.html

To achieve these objectives Mercy's current project is to construct a Phase 2 Hospital build-out with 54,889 SF of expanded hospital space and approximately 34,987 SF for an Ambulatory Surgical Center (ASC). The hospital expansion will be directly connected to the existing Phase 1 Fore River Hospital, while maximizing site safety and allowing for a future Phase 3 expansion that would be in close proximity to the ASC. The ASC will be positioned within the former gravel pit area so that it provides relatively close proximity to the Hospital while also maintaining its own parking and stand-alone features, given its outpatient services programing.

DEVELOPMENT PROPOSAL

Mercy Hospital is proposing to develop their Phase 2 Hospital expansion on the Fore River development site with construction to begin in early 2020, pending City Site plan approval and building permits. The current development plan includes the following uses:

- The Phase 2 Hospital expansion wherein all State Street hospital functions are relocated to the Fore River Campus. This will include an additional 54,889 SF of Hospital program area over a 20,140 SF building expansion footprint. The expansion area will occur on the north end of the existing hospital over an area currently used for surface parking containing 105 parking spaces for staff only. The hospital expansion will include Emergency Room services, thus a new parking area with 19 spaces designated for emergency room patient and visitors will be provided to the north side of the expansion. Additional parking for up to 8 ambulances will also be provided and designated entries for both patient drop off and ambulance drop off/pick up to the emergency room have been depicted on the site plan. The four level expansion will be partially screened by the existing hospital and Medical office locations for views from the parkway. SMRT Architects is responsible for the building expansion design and ASC design and they have prepared floor plans, building elevations and various renderings depicting the proposed architecture for these buildings.

- The front entry drive past the existing main Hospital entrance will be extended between the existing Hospital, proposed expansion and the existing Medical office thus connecting the front of the Hospital to the parking lot to the north side of the MOB. This one-way drive will provide access to the expansion and the MOB.

- A 34,987 SF Ambulatory Surgical Center (ASC) will be established within the former gravel pit area that will be partially filled. The two-story building will be accessed from a new driveway off the southerly site entrance and the building access will include a staff entry at the rear of the building. The ASC positioning will keep its visibility somewhat muted given the location and higher building height of the existing hospital in the foreground and the much larger new MMC 2,500 space parking garage in the background.

- Accessory uses, including but not limited to, surface parking facilities, ASC utility services, stormwater management systems, and site amenities are also part of the current proposal. A new parking lot containing 103 parking spaces will be provided on the north end of the ASC site and this parking is expected to replace the displaced parking due to the expansion. An additional parking lot of 73 spaces will be provided on the south side of the ASC and this lot will be designated specifically for ASC use. The total onsite parking available will be 857 spaces, which will exceed the required by code parking requirement of 679 spaces. The expected parking demand for the site upon completion of the Hospital expansion and the ASC is met with the 857 spaces as that provides for a "practical capacity"

factor of around 25%. A parking demand study at the Fore River campus completed by Gorrill Palmer in January 2017, determined the parking demand to be about 525 vehicles using the 762 existing spaces. Mercy anticipates the proposed parking will adequately meet proposed demand and this will preclude the need for any further parking expansion or structured parking conditions.

- There will be continued use of public open space along the waterfront at the north and south ends of the campus and access to the Fore River Trail along the Parkway as well as pedestrian walks throughout the campus; and

- Continued use of the south end of the campus for snow storage and/or remote parking.

- Metro Bus service currently serves the site and this will remain a critical access condition into the future.

All of the above facilities will be developed primarily to support the main use of the site as a hospital campus, although it is anticipated that some use of support facilities by others in the neighboring community may occur.

Two separate access drives will continue to provide access to the Hospital campus off the Fore River Parkway. These access locations remain fixed due to geometric and sight line constraints along the Fore River Parkway. These fixed locations also contribute to the planning and layout challenges for the site. Access off County Way is limited to emergency vehicles only, as it requires crossing of Pan Am Railway's tracks.

The Phase 2 project's proposed stormwater management systems will provide water quality treatment measures to treat the new structure area developed as part of the Phase 2 expansion. The intent is to meet the current MDEP Chapter 500 Standards and City of Portland Standards including treatment of at least 95% of new structure area and 80% of the Phase 2 developed area. Stormwater quantity control is not required since the site will be discharging to tidal waters. The primary mechanism for water quality treatment will be a wet pond that will be constructed. This wet pond will benefit from existing infrastructure including an outfall that ultimately discharges to the Fore River.

Additional landscaping including perimeter tree plantings will continue to be provided for buffering and aesthetic benefits. The existing site design includes substantial open space necessary to satisfy local requirements associated with the Contract Zone Agreement negotiated between Mercy Hospital and the City of Portland.

EXISTING CONDITIONS

The Mercy Campus currently contains the 137,832 SF Phase 1 Hospital and an approximately 82,186 SF medical office building both of which are located north of the former gravel pit wetland located in the middle of the site. Site access is from two primary driveways. The northerly, unsignalized driveway allows left and right turn entering off the Fore River Parkway, but only right turn exiting onto the Parkway. The southerly signalized driveway allows entering and exiting movements in each direction. The south end of the site currently contains a surface parking lot for 310 vehicles. A small maintenance building remains at the site's south end also. A snow storage area at the far south end of the site will remain.

The site's parking is spread out over five surface parking lots. The northerly lots contain over 452 spaces used by the medical office building staff and visitors as well as by the Phase 1 Hospital patients, visitors and some staff. The southerly parking lot is used by Phase 1 Hospital staff as well as for remote parking for State Street Hospital staff. Mercy currently runs a shuttle service between the parking lot and the State Street facility. Drainage systems within these parking lots capture and convey stormwater runoff to the Fore River.

Mercy maintains the entire site and those areas not covered by building or parking are well landscaped and managed with manicured lawn and planting beds. A generous number of trees and shrubs compliment the site's appearance.

Gorrill Palmer conducted a parking evaluation in the fall 2018 and concluded that the existing onsite parking exceeds the parking demand encountered on the site. There are an existing 762 spaces on the property and the peak existing demand was determined to be approximately 525 spaces (69% of total). An update to the parking demand analysis is underway and will be provided for review once complete.

Gorrill Palmer also conducted a driveway analysis to verify whether the existing driveways will operate safely and with an acceptable level of service. They concluded that there are no high accident locations in the vicinity of the site and that the site driveways will operate at acceptable levels off service. An updated analysis will be provided for City review upon completion.

UTILITIES

The Hospital Campus will continue to be served by public water, sewer, natural gas, and nearby communication, cable, and electric utilities. Onsite water service consists of a 12" water main. A 42" sanitary sewer interceptor borders the site along its easterly border. The Hospital will continue to manage its wastewater flow stream in a similar fashion to the existing facilities at both Fore River and State Street. Communications, cable, and electric utilities are located on the project site.

CONSTRUCTION SCHEDULE

The Phase 2 project is currently under design with a targeted construction start date for March 2020 and construction completion in early 2022.

The project will be phased beginning with the placement of fill in the borrow pit to create temporary parking and construction staging facilities. The temporary facilities will allow subsequent construction of the main Phase 2 Hospital expansion followed by the ASC. The Hospital expansion effort involves a coordinated effort that maintains ongoing Hospital functions and service throughout the Phase 2 duration. A Construction Management Plan has been prepared by Consigli and is appended to the Construction Management Plan section of this application.

RE: Site Location of Development Act and Natural Resources Protect Act Applications
Portland, DEP #L-20775-19-T-A/L-20775-TG-U-N

Dear Mr. Connolly:

Enclosed is a signed copy of your Department of Environmental Protection land use permit. Please note that the permit includes a description of your project, findings of fact that relate to the approval criteria the Department used in evaluating your project, and conditions that are based on those findings and the particulars of your project. Please take several moments to read your permit carefully, paying particular attention to the conditions of the approval. The Department reviews every application thoroughly and strives to formulate reasonable conditions of approval within the context of the Department's environmental laws. Also attached are some materials that describe the Department's appeal procedures for your information.

If you have any questions about the permit please contact me at (207) 615-6426 or at christine.woodruff@maine.gov.

Sincerely,

Chris Woodruff

DEPARTMENT ORDER

IN THE MATTER OF

MERCY HOSPITAL	) SITE LOCATION OF DEVELOPMENT ACT
Portland, Cumberland County	) NATURAL RESOURCES PROTECTION ACT
PHASE II RELOCATION PROJECT	) TIER 3 WETLAND ALTERATION
L-20775-19-T-A (approval)	) WATER QUALITY CERTIFICATION
L-20775-TG-U-N (approval)	) FINDINGS OF FACT AND ORDER

Pursuant to the provisions of 38 M.R.S.A. Sections 481 et seq. and 480-A et seq., 38 M.R.S.A. Sections 480-A et seq. and Section 401 of the Federal Water Pollution Control Act, the Department of Environmental Protection has considered the application of MERCY HOSPITAL with the supportive data, agency review comments, and other related materials on file and FINDS THE FOLLOWING FACTS:

1. PROJECT DESCRIPTION:

A. History of Project: In Department Order #L-20775-19-A-N/L-20775-TG-B-N, dated June 26, 2002, the Department approved the development of a new Mercy Hospital Campus on 85.5 acres off Congress Street, adjacent to the Fore River in Portland. In Department Orders #L-20775-19-C-T, #L-20775-19-D-M, and #L-20775-TG-E-M, the Department approved the partial transfer and modification of the original Orders by the Maine Department of Transportation for the construction of a connector road, the Fore River Parkway, across the property. Approximately three acres of land was transferred to the Maine Department of Transportation for the construction of the new Veteran's Bridge to South Portland. Subsequent Department Orders approved several minor modifications.

B. Summary: The applicant proposes to construct Phase II of the Mercy Hospital relocation project that consists of a 116,980-square foot hospital building expansion, a 15,000-square foot medical office building, a detached 40,000-square foot medical office building, a 51,800-square foot parking garage, a 33,800-square foot parking garage, an elevated parking deck and associated on-site traffic circulation renovations. The project includes utility service relocations and new stormwater management systems. The two existing site entrances will remain the same. The project is shown on a set of plans, the

first of which is titled "Site Development Plans for Mercy Hospital Fore River Hospital Relocation Project Amended Master Plan / Phase II Expansion," prepared by DeLuca-Hoffman Associates, and dated May 2012, with a last revision date of October 23, 2012. The project is located on the remaining approximately 33 acres of the parcel on the east side of the Fore River Parkway in the City of Portland.

The applicant is also seeking approval under the Natural Resources Protection Act to fill a 3.49-acre freshwater wetland.

C. Current Use of Site: The portion of the site that is east of the Fore River Parkway is completely developed except for the central portion of the site that is occupied by a pond and wetlands. The existing development includes a hospital building, a medical office building, a maintenance building, parking, utilities, and access roads.

2. FINANCIAL CAPACITY:

The total cost of the project is estimated to be $5,378,880.00. The applicant submitted a letter from Eastern Maine Healthcare System, dated February 21, 2013, stating that Eastern Maine Healthcare System and Mercy Health System of Maine executed an affiliation agreement on January 14, 2013, pursuant to which Eastern Maine Healthcare System will become the sole corporate member of Mercy Health System of Maine. Pursuant to terms of the affiliation agreement and subject to the regulatory approval and closure of the transaction, as well as other contractual restrictions, Eastern Maine Healthcare System has committed to spending $115 million in support of Mercy Health System of Maine. This financial support includes expanding the Fore River campus of Mercy Hospital to consolidate Mercy Hospital's State Street facility onto the Fore River campus. Prior to the start of construction, the applicant must submit evidence that it has been granted a line of credit or a loan by a financial institution authorized to do business in this State or evidence of any other form of financial assurance determined by Department Rules, Chapter 373(1), to be adequate to the Bureau of Land and Water Quality (BLWQ) for review and approval as a condition of compliance.

The Department finds that the applicant has demonstrated adequate financial capacity to comply with Department standards provided that the applicant submits evidence of financial capacity to the BLWQ for review and approval prior to the start of construction.

3. TECHNICAL ABILITY:

The applicant provided resume information for key consultants involved with the project and a list of projects successfully constructed by the applicant and the consultants. The applicant retained the services of DeLuca-Hoffman Associates, a professional engineering firm, to provide site design and engineering of the project. Haley and Aldrich provided geotechnical engineering, Normandeau Associates was the wetland consultant, Hoffman Engineering provided environmental engineering, Owen Haskell

provided land surveying services, SMRT provided architectural services and Tewhey Associates was the project manager.

The Department finds that the applicant has demonstrated adequate technical ability to comply with Department standards.

4. NOISE:

The proposed project is primarily the expansion of an existing hospital campus. A hospital is classified as a development producing a minor noise impact. The Department finds that no regulated sources of noise have been identified.

5. SCENIC CHARACTER:

The Mercy Hospital Fore River Campus is located between the Fore River Parkway and an active railroad line. The Cumberland County Jail is across the railroad tracks to the north, commercial development on Saint John Street is across the railroad tracks to the east, the Veterans' Memorial Bridge is to the south and a mud flat and Interstate Route 295 is across the Fore River Parkway to the west. The areas of the proposed project that are not to be covered with structures, parking areas or vehicle circulation facilities will be landscaped and maintained consistent with the current landscaping features including providing landscaped strips within parking lots. The project will be in keeping with the existing buildings, grounds and surrounding scenic character.

Based on the project's location and design, the Department finds that the proposed project will not have an unreasonable adverse effect on the scenic character of the surrounding area.

6. WILDLIFE AND FISHERIES:

The Maine Department of Inland Fisheries and Wildlife (MDIFW) reviewed Phase 1 of the Mercy Hospital project at the Fore River site in 2002 and stated that it found no records of any Essential or Significant Wildlife Habitats, or other wildlife habitats of special concern associated with this site. But MDIFW noted that the wetlands on the site, particularly the pond, was used by several species of waterfowl and wading birds and recommended that impacts to the birds be minimized by maximizing the retention of the existing buffer around the pond and maintaining or elevating the water level of the pond. The 2002 project was constructed to eliminate direct impact to the pond by directing stormwater runoff to other locations and placing a buffer around the pond. Subsequent monitoring of the site since 2006 has documented use by waterfowl (mallards, black ducks), wading birds (green heron, great blue heron), a variety of passerine species (red-winged blackbird, mocking birds, common yellow throat, song sparrow), gulls and painted turtles. Fish have been observed in the pond and mammal signs include grey fox, chipmunks and woodchucks.

As part of the review for the currently proposed expansion project that includes filling of the pond and wetland used by the above noted wildlife, MDIFW visited the site to determine if additional buffering could be added on land owned by Mercy Hospital adjacent to the Fore River on the northwest portion of the site to compensate for the loss of habitat in the pond area. Due to several issues on the land adjacent to the Fore River, it was determined that a buffer that would provide roosting habitat along the Fore River was not feasible. The loss of wetlands as a result of the proposed Phase II will be compensated for through a contribution into the In-Lieu Fee (ILF) program of the Maine Natural Resource Conservation Fund (MNRCF), discussed further in Finding 13. It was determined that the loss of wildlife habitat from the wetland impacts could be compensated for by emphasizing on the ILF Project Data Worksheet that the habitat losses include waterfowl habitat so that the funds could be used towards replacement of the habitat. It was also determined that the resident turtle population in the pond should be relocated. The applicant has developed a Turtle Trapping and Removal plan that followed the recommendations made by MDIFW. The applicant must implement the relocation plan prior to the start of construction and release the turtles to Capisic Pond Park in Portland and/or Evergreen Cemetery on Stevens Avenue in Portland, or to another location with prior approval from MDIFW.

The Department finds that the applicant has made adequate provision for the protection of wildlife and fisheries provided the wildlife habitats are noted on the In Lieu Fee (ILF) Project Data Worksheet and that prior to the start of construction, the Turtle Trapping and Removal plan is implemented as recommended by MDIFW.

7. SOILS:

There are several locations on the site that have lead-contaminated ash from the former railroad operations that have been covered with clean soil or bituminous pavement to prevent direct exposure. The proposed project was reviewed by an Oil and Hazardous Materials Specialist in the Bureau of Remediation and Waste Management (BRWM) in regards to the existing Voluntary Response Action Plan for the site. BRWM concluded that they have no issues with the planned expansion provided that the appropriate precautions are followed during the project to insure that the contaminated ash is handled, placed on site and/or disposed as appropriate and that the necessary cover systems are in place once the project is completed. The current deed restrictions on the property that were placed during Phase 1 work are consistent with and adequate as future restrictions for the property, and will continue to be subject to the operation and maintenance program with annual inspections.

The applicant has previously submitted a geotechnical report based on the soils found at the project site which was previously reviewed by the Division of Environmental Assessment (DEA).

The Department finds that, based on the comments from the BRWM and DEA's previous review, the soils on the project site present no limitations to the proposed project that cannot be overcome through standard engineering practices.

8. STORMWATER MANAGEMENT:

The proposed project includes approximately 4.12 acres of new impervious area for a total of 19.80 acres of impervious area, and 4.89 acres of new developed area for a total of approximately 29.03 acres of developed area. It lies within the watershed of the tidal waters of the Fore River. The applicant submitted a stormwater management plan based on the Basic, General, and Flooding standards contained in Department Rules, Chapter 500. The proposed stormwater management system consists of an underdrained soil filter, an underdrained bioretention cell, an underdrained subsurface sand filter, and proprietary filters (Filterra ® and StormFilter®).

A. Basic Standards:

(1) Erosion and Sedimentation Control: The applicant submitted an Erosion and Sedimentation Control Plan that is based on the performance standards contained in Appendix A of Chapter 500 and the Best Management Practices (BMPs) outlined in the Maine Erosion and Sediment Control BMPs, which were developed by the Department. This plan and plan sheets containing erosion control details were reviewed by, and revised in response to the comments of, the Division of Land Resource Regulation (DLRR) of the BLWQ.

Erosion control details will be included on the final construction plans and the erosion control narrative will be included in the project specifications to be provided to the construction contractor.

(2) Inspection and Maintenance: The applicant submitted a maintenance plan that addresses both short and long-term maintenance requirements. This plan was reviewed by, and revised in response to the comments of, DLRR. The maintenance plan is based on the standards contained in Appendix B of Chapter 500. The applicant will be responsible for the maintenance of all common facilities including the stormwater management system.

Prior to occupancy of the new buildings, the applicant must submit a copy of an executed long-term maintenance contract (minimum of 5 years and renewable) for the on-going maintenance of the Filterra®, the underdrained subsurface sand filter, and the StormFilter® to the BLWQ. Storm sewer grit and sediment materials removed from any parts of the stormwater management system, including conveyance structures, during maintenance activities must be disposed of in compliance with the Maine Solid Waste Management Rules.

(3) Housekeeping: The proposed project will comply with the performance standards outlined in Appendix C of Chapter 500.

Based on DLRR's review of the erosion and sedimentation control plan and the maintenance plan, the Department finds that the proposed project meets the Basic Standards contained in Chapter 500(4)(A).

B. General Standards:

The applicant's stormwater management plan includes general treatment measures that will mitigate for the increased frequency and duration of channel erosive flows due to runoff from smaller storms, provide for effective treatment of pollutants in stormwater, and mitigate potential temperature impacts. This mitigation is being achieved by using Best Management Practices (BMPs) that will control runoff from 95% of the impervious area and 96% of the developed area.

The stormwater management system proposed by the applicant was reviewed by, and revised in response to comments from, DLRR. After a final review, DLRR commented that the proposed stormwater management system is designed in accordance with the General Standards contained in Chapter 500(4)(B) and recommended that the applicant retain the design engineer, or another qualified engineer, to oversee the construction of the stormwater management structures according to the details and notes specified on the approved plans. Within thirty days of completion of each stormwater management structure, the applicant must submit a log of inspection reports detailing the items inspected, photos taken, and the dates of each inspection to the BLWQ for review.

Based on the stormwater system's design and DLRR's review, the Department finds that the applicant has made adequate provision to ensure that the proposed project will meet the General Standards contained in Chapter 500(4)(B).

C. Flooding Standard:

The applicant is not proposing a formal stormwater management system to detain stormwater from 24-hour storms of 2-, 10-, and 25-year frequency. Instead, since the project site is located adjacent to a tidal section of the Fore River, the applicant requested a waiver from the flooding standard pursuant to Department Rules, Chapter 500(4)(E)(2)(a). DLRR reviewed the request for a waiver of the flooding standard and recommended that the waiver be granted.

The Department finds that the proposed project will meet the Chapter 500 standards for management of stormwater discharges and discharges to coastal wetlands.

9. WATER SUPPLY:

When completed, the proposed expanded project is anticipated to use 63,919 gallons of water per day. Water will be supplied by the Portland Water District. The applicant submitted a letter from the Portland Water District, dated January 2, 2013, indicating that it will be capable of servicing this project.

The Department finds that the applicant has made adequate provision for securing and maintaining a sufficient and healthful water supply.

10. WASTEWATER DISPOSAL:

When completed, the proposed project is anticipated to discharge up to 63,919 gallons of wastewater per day to the Portland Water District's East End wastewater treatment facility. This project was reviewed and approved by the Division of Water Quality Management (DWQM) of the BLWQ, which commented that the East End wastewater treatment facility has the capacity to treat these flows but has some non-compliance issues that are being addressed by the Portland Water District and scrutinized by the Department.

Based on DWQM's comments, the Department finds that the applicant has made adequate provision for wastewater disposal at a facility that has the capacity to ensure satisfactory treatment.

11. SOLID WASTE:

All municipal solid wastes from the proposed project will be disposed of at Ecomaine, which is currently in substantial compliance with the Maine Solid Waste Management Rules. All wood waste generated from site clearing, such as stumps and grubbings, will be ground and used on site. Any treated wood and mixed construction and demolition debris will be transported to Juniper Ridge Landfill in Old Town or Waste Management in Norridgewock. Untreated wood waste from construction will be sent to KTE Biofuels in Lewiston or to the City of Portland Riverside Recycling Facility. Any petroleum-contaminated soils will be transported to CPRC Group in Scarborough. Biomedical waste will be disposed of at Stericycle in Massachusetts. Any chemical waste will be sent to Clean Harbors Waste Disposal Services. Scrap metal will be sent to One Steel located in Arundel and Oakland, or to Schnitzer Steel in Portland. Any coal ash encountered will be handled in accordance with the Voluntary Response Action Plan. The BRWM reviewed this section of the application and found these facilities are in substantial compliance with the Maine Solid Waste Management Rules.

Based on the above information, the Department finds that the applicant has made adequate provision for solid waste disposal.

12. FLOODING:

The project is adjacent to tidal mudflats of the Fore River. The one hundred year flood elevation of the Fore River and Atlantic Ocean is elevation 10.0 (NGVD 29). The pond and the surrounding wetlands in the old excavated gravel pit portion of the site are below elevation 10.0 and could possibly flood from backflow from the Fore River through the storm drain system. After the pond and surrounding wetlands are filled for the proposed project, all the elevations of the site east of the Fore River Parkway will be above the one hundred year flood elevation. This loss of flood plain area in the Fore River watershed is unlikely to cause an increase in the flood elevation of the Fore River and the surrounding areas because the amount of flood plain area loss from the proposed project is very small in comparison to the flood plain area of the Fore River and surrounding tidal areas.

The Department finds that the proposed project is unlikely to cause or increase flooding or cause an unreasonable flood hazard to any structure.

13. WETLAND IMPACTS:

The applicant proposes to alter 151,924 square feet (3.49 acres) of wetlands to construct the proposed project. The types of wetland proposed to be impacted are 63,446 square feet of open water, 51,236 square feet of emergent/open water wetland, 17,298 square feet of forested wetland, 10,895 square feet of shrub/emergent wetland, 6,458 square feet of shrub wetland, and 2,591 square feet of emergent wetland. These wetlands are the existing pond and the surrounding wetlands in the central part of the site that were originally created from gravel extraction below the groundwater table. The pond is considered artificial and is not considered a wetland of special significance. The purpose and need of the wetland impact is to consolidate the operations of the hospital from the existing two campuses, one on State Street and one on the Fore River Parkway, to a single hospital campus on the Fore River Parkway site, which will allow Mercy Hospital to increase the capacity of the hospital for outpatient care and to provide a facility that meets current hospital standards.

In Department Order #L-20775-19-A-N/L-20775-TG-B-N, dated June 26, 2002, the Department approved 39,835 square feet (0.91 acre) of mostly scrub shrub wetland impact for the initial development of the site by the applicant. The cumulative wetland impact for the existing project plus the proposed project is 191,301 square feet (4.40 acres).

The Wetland Protection Rules interpret and elaborate on the NRPA criteria for obtaining a permit. The rules guide the Department in its determination of whether a project's impacts would be unreasonable. A proposed project would generally be found to be unreasonable if it would cause a loss in wetland area, functions and values and there is a practicable alternative to the project that would be less damaging to the environment. Each application for a Natural Resources Protection Act permit that involves a freshwater

wetland alteration must provide an analysis of alternatives in order to demonstrate that a practicable alternative does not exist.

A. Avoidance. No activity may be permitted if there is a practicable alternative to the project that would be less damaging to the environment. The applicant submitted an alternative analysis for the proposed project completed by Normandeau Associates and dated July 2012.

The applicant evaluated using single and dual campus alternatives to bring the hospital up to appropriate standards of care, safety, efficiency, convenience, and cost effectiveness. The applicant examined moving all operations back to the State Street campus; however the existing facility on State Street has the deficiencies of an aging facility including: an internal power distribution system that is antiquated, at-load capacity and in need of replacement; piping systems that need replacement; the two primary chillers of the heating, ventilating and air conditioning system need replacement; and the lack of space for parking is a major issue that includes high costs and inconvenience for patients and employees. Therefore, moving back to a single campus on State Street is not a feasible alternative because it will not meet the project purpose based on the expense and the inability to create a state-of-the-art healthcare facility.

The applicant evaluated moving all operation to a third site. A search was conducted for alternative sites in 2001 and 2002 that found no other local site was feasible or appropriate. The relocation of all operations to a third location is considered not practicable because it would not meet the project purpose of having a facility in Portland and the $90 million invested in the Fore River location could not be recouped which would jeopardize the long-term sustainability of the hospital.

The applicant evaluated maintaining a duel campus, but has found that two campuses perpetuates unfavorable conditions that would render the hospital unsustainable in the long term because of safety issues, operational difficulties, inconvenience, the expenses of duplicated services, bussing between facilities and renovating the State Street facility, and does not meet the project purpose of having a cost-effective, safe, and state-of-the-art healthcare facility.

The applicant evaluated consolidating operations onto the Fore River Campus with the proposed expansion. This would result in a state-of-the-art facility that would be best for healthcare delivery logistics, staff and patient access, reduction in operating costs, increases in staff efficiency, eliminating the need for duplicated services, and could lead to higher employee retention rates. This alternative meets the project purpose, is practicable in terms of cost effectiveness, and provides a state-of-the-art facility.

The applicant evaluated five alternative site layouts for the expanded Fore River campus, which included layouts that partially or completely filled the central wetland. Alternative ONS-3 shown in the project application avoided impacts to the wetland but did not

address current and anticipated future changes in the U.S. healthcare delivery system, including large increases in the amount of outpatient and ambulatory services provided by hospital campuses which would create a need for increased hospital size and more adjacent parking. Therefore, alternative ONS-3 was rejected.

Alternatives ONS-4 thru ONS-7 represented site layouts that minimize impacts to the central wetland, however they result in an unacceptable facility design that significantly limits the hospital's clinical operations. These unacceptable facility designs include congested and unsafe traffic circulation conditions where the Ambulatory Care Center and Emergency Department entrances are immediately adjacent to one another and other traffic circulation problems that result in confusion and congestion problems for incoming patients and visitors. These designs do not provide parking structures that are located in the critically essential location immediately adjacent to the ambulatory care center. These alternatives would also encroach on the wetland. One of the primary functions and values of the wetland is wildlife habitat, and it was recognized that direct encroachment on the wetland, shading of the wetland, and human activities associated with the building in closer proximity to the wetland would likely have a detrimental effect on this wetland function and value. Although these alternatives would have less direct wetland impact than the proposed project, these alternatives were deemed impracticable for the delivery of patient care services and would likely have detrimental effect on the wetland's wildlife functions and values.

Alternative ONS-8 is the basis of the proposed project. This alternative fills the entire central wetland and raises the grades of the site up such that the emergency department entrance and the building expansion entrance are at the same elevation as the entrance of the Phase 1 hospital. This feature is an important design element to the hospital because it reduces patient and visitor navigation issues inside the building. This alternative meets the current standards for hospital design with appropriate adjacencies and colocation of key services; allows physician and staff efficiency because it has inpatient and outpatient services at one facility; it provides parking for both patients and staff adjacent to the hospital; and, provides enough floor space to meet current program objectives. It is the connectedness of the existing and proposed facility and the future expansion potential that makes this alternative the preferred alternative and the applicant stated that this is the only practicable alternative of meeting the project purpose of a state-of-the-art facility.

B. Minimal Alteration. The amount of freshwater wetland to be altered must be kept to the minimum amount necessary for meeting the overall purpose of the project. The applicant examined alternative site layouts for the project and the only site layout that met the overall purpose of the project proposes to fill 3.49 acres of wetland. Other alternative site layouts that had less direct impact to the wetland were reviewed, but they did not meet the project purpose and need and the wetland alterations, although smaller, would most likely compromise the higher functions and values of the wetland. Given the chosen alternative described in Finding 13 A, the amount of alteration cannot be further minimized.

C. Compensation. Compensation is required to achieve the goal of no net loss of wetland functions and values because the project alters greater than 15,000 square feet of freshwater wetland, which is the threshold over which compensation is generally required. The applicant conducted a wetland mitigation site search and concluded that on-site mitigation was not possible due to space constraints. Although off-site parcels represented viable options for wetland compensation, none of the parcels meet the objectives of compensating for the lost wetland acreage and functions and values within the watershed. The applicant proposes to mitigate for the lost wetland functions and values by making a payment to the In-Lieu Fee (ILF) program of the Maine Natural Resource Conservation Fund (MNRCF).

The wetland that is proposed to be filled was originally formed as a gravel extraction area that was excavated below the groundwater table. This wetland was used as a wetland preservation area to partially compensate for the 0.91 acre of wetland losses approved in Department Order #L-20775-19-A-N/L-20775-TG-B-N. As part of the wetland compensation package for that permit and to enhance the wildlife habitat at the site, the pond and surrounding wetland was enhanced by the removal of solid wastes (such as trash, white goods, tires, metal, etc.), the water quality of the pond was protected by designing the stormwater management system such that only limited amounts of stormwater were directed to the wetland, and a narrow buffer around the wetland was maintained. The remaining wetland compensation for the 0.91 acre of impact from the initial project was 0.21 acre wetland creation in swales on the west side of the Fore River Parkway. The 0.21 acre of wetlands created as compensation for the initial project will not be affected by the proposed project.

The wetland proposed to be impacted is classified as a palustrine (freshwater) system with the following cover type classes: emergent (PEM1), open water (PUB3/4), forested (PFO1), and shrub wetland (PSS1). The pond is fed by a groundwater discharge that appears to flow year-round; therefore, groundwater recharge/discharge is considered a principle function of the wetland. Small fish have been observed in the pond in the past; this population is likely the remnant from birds or the previous hydrological connections to the Fore River and is supported by the groundwater flows; hence, fish and shellfish habitat is a principle function of the wetland. Sediment/toxicant retention is expected to be one of the principle functions of the wetland because any toxicants and sediments flowing into the wetland from the surrounding uplands would become trapped in the organic rich substrate observed in many areas around the pond. Nutrient removal/retention/transformation is expected to be another principle function of the wetland based on the observation of the density and type of vegetation thriving in the wetland and the presence of organic deposits in the wetland. Floodflow alteration is not a principle function of the wetland. Production export is not considered a principal function either. The wetland does provide food for wildlife. The wetland provides habitat for small fish, invertebrates and amphibian populations, which provides a forage base for secondary and tertiary consumers. Reptiles (turtles) have been observed basking

around the pond. Piscivorous birds, including herons, were observed foraging in and along the pond habitat. Migratory waterfowl, including mallard ducks and black ducks, were observed using the wetland. Although the wetland provides food for the wildlife utilizing the wetland, it does not provide nutrients that are transported out of the wetland. Wildlife habitat is considered to be a principle function of the wetland because of the variety of resident and migratory species present. As noted above, the pond has populations of invertebrates, fish and amphibians that provide a forage base for higher trophic level consumers. The wetlands and adjacent forested upland also support small mammals such as voles, shrews, field mice, and potentially larger mammals such as fox and woodchucks. Uniqueness/heritage value is believed to be present because the central wetland is somewhat unique as the surrounding land is developed and freshwater wetlands are rare on the Portland peninsula.

The wetland compensation required in Department Order #L-20775-19-A-N/L-20775-TG-B-N for 0.70 acre of wetland impacts will be eliminated by the proposed project, plus an additional 3.49 acres of wetland impact requires compensation, therefore the total amount of wetland impact requiring compensation for the project is 4.19 acres. The applicant proposes to make a contribution into the ILF program of the MNRCF in the amount of $834,156.00. Prior to the start of construction, a cashier's check or bank draft, payable to "Treasurer, State of Maine", with the permit number noted on the check, must be mailed to: ME DEP, Attn: ILF Program Administrator, State House Station 17, Augusta, ME 04333.

The Department finds that the applicant has avoided and minimized wetland impacts to the greatest extent practicable, and that the proposed project represents the least environmentally damaging alternative that meets the overall purpose of the project provided that prior to project construction, the applicant submits the ILF payment as described above.

14. AIR QUALITY:

The applicant has obtained an air emissions license from the Bureau of Air Quality, #A-912-71-A-N, for Phase I of the project. The applicant must amend its air emissions license from the Bureau of Air Quality prior to using any new equipment that requires an air emissions license.

15. ALL OTHER:

All other Findings of Fact, Conclusions and Conditions remain as approved in Department Order #L-20775-19-A-N and #L-20775-TG-B-N, and subsequent orders.

BASED on the above findings of fact, and subject to the conditions listed below, the Department makes the following conclusions pursuant to 38 M.R.S.A. Sections 480-A et seq. and Section 401 of the Federal Water Pollution Control Act:

A. The proposed activity will not unreasonably interfere with existing scenic, aesthetic, recreational, or navigational uses.

B. The proposed activity will not cause unreasonable erosion of soil or sediment.

C. The proposed activity will not unreasonably inhibit the natural transfer of soil from the terrestrial to the marine or freshwater environment.

D. The proposed activity will not unreasonably harm any significant wildlife habitat, freshwater wetland plant habitat, threatened or endangered plant habitat, aquatic habitat, travel corridor, freshwater, estuarine, or marine fisheries or other aquatic life provided that the applicant makes a contribution to the In-Lieu Fee (ILF) program, the wildlife habitat losses are noted on the In Lieu Fee (ILF) Project Data Worksheet as described in Findings 6 and 13, and the Turtle Trapping and Removal plan is implemented prior to construction as described in Finding 6.

E. The proposed activity will not unreasonably interfere with the natural flow of any surface or subsurface waters.

F. The proposed activity will not violate any state water quality law including those governing the classifications of the State's waters.

G. The proposed activity will not unreasonably cause or increase the flooding of the alteration area or adjacent properties.

H. The proposed activity is not on or adjacent to a sand dune.

I. The proposed activity is not on an outstanding river segment as noted in 38 M.R.S.A. Section 480-P.

BASED on the above findings of fact, and subject to the conditions listed below, the Department makes the following conclusions pursuant to 38 M.R.S.A. Sections 481 et seq.:

A. The applicant has provided adequate evidence of financial capacity and technical ability to develop the project in a manner consistent with state environmental standards provided that the applicant submits evidence of financial capacity to the BLWQ for review and approval prior to the start of construction as described in Finding 2.

B. The applicant has made adequate provision for fitting the development harmoniously into the existing natural environment and the development will not adversely affect existing uses, scenic character, air quality, water quality or other natural resources in the municipality or in neighboring municipalities.

C. The proposed development will be built on soil types which are suitable to the nature of the undertaking and will not cause unreasonable erosion of soil or sediment nor inhibit the natural transfer of soil.

D. The proposed development meets the standards for storm water management in Section 420-D and the standard for erosion and sedimentation control in Section 420-C provided that the applicant retains the design engineer, or another qualified engineer, to oversee the construction of the stormwater management structures; submits a log of inspection reports to the BLWQ for review; submits a copy of an executed long-term maintenance contract for the on-going maintenance of the Filterra®, the underdrained subsurface sand filter, and the StormFilter®; and, disposes of materials removed from the stormwater management systems in compliance with the Maine Solid Waste Management Rules as described in Finding 8.

E. The proposed development will not pose an unreasonable risk that a discharge to a significant groundwater aquifer will occur.

F. The applicant has made adequate provision of utilities, including water supplies, sewerage facilities and solid waste disposal required for the development and the development will not have an unreasonable adverse effect on the existing or proposed utilities in the municipality or area served by those services.

G. The activity will not unreasonably cause or increase the flooding of the alteration area or adjacent properties nor create an unreasonable flood hazard to any structure.

THEREFORE, the Department APPROVES the application of MERCY HOSPITAL to construct Phase II of the Mercy Hospital Relocation project as described above, SUBJECT TO THE FOLLOWING CONDITIONS and all applicable standards and regulations:

1. The Standard Conditions of Approval, a copy attached.

2. In addition to any specific erosion control measures described in this or previous orders, the applicant shall take all necessary actions to ensure that its activities or those of its agents do not result in noticeable erosion of soils or fugitive dust emissions on the site during the construction and operation of the project covered by this approval.

3. Severability. The invalidity or unenforceability of any provision, or part thereof, of this License shall not affect the remainder of the provision or any other provisions. This

License shall be construed and enforced in all respects as if such invalid or unenforceable provision or part thereof had been omitted.

4. The applicant or other responsible party shall, within three months of the expiration of each five-year interval from the date of this Order, submit a report certifying that the items listed in Department Rules, Chapter 500, Appendix B(4) have been completed in accordance with the approved plans.

5. Prior to the start of construction, the applicant must submit evidence that it has been granted a line of credit or a loan by a financial institution authorized to do business in this State or evidence of any other form of financial assurance determined by Department Rules, Chapter 373(1), to be adequate to the BLWQ for review and approval.

6. Prior to occupancy of the new buildings, the applicant shall submit a copy of an executed long-term maintenance contract (minimum of 5 years and renewable) to the BLWQ for the on-going maintenance of the Filterra®, the underdrained subsurface sand filter, and the StormFilter®.

7. Storm sewer grit and sediment materials removed from any parts of the stormwater management system, including conveyance structures, during maintenance activities shall be disposed of in compliance with the Maine Solid Waste Management Rules.

8. The applicant shall retain the design engineer, or another qualified engineer, to oversee the construction of the stormwater management structures according to the details and notes specified on the approved plans. Within thirty days of completion of each stormwater management structure, the applicant shall submit a log of inspection reports detailing the items inspected, photos taken, and the dates of each inspection to the BLWQ for review.

9. Prior to the start of construction, the applicant shall mail or deliver a cashier's check or bank draft in the amount of $834,156.00, payable to "Treasurer, State of Maine", with the permit number noted on the check, to: ME DEP, Attn: ILF Program Administrator, State House Station 17, Augusta, ME 04333.

10. Prior to the start of construction, the applicant shall implement the Turtle Trapping and Removal plan.

11. All other Findings of Fact, Conclusions and Conditions remain as approved in Department Order #L-20775-19-A-N and #L-20775-TG-B-N, and subsequent orders, and are incorporated herein.

THIS APPROVAL DOES NOT CONSTITUTE OR SUBSTITUTE FOR ANY OTHER REQUIRED STATE, FEDERAL OR LOCAL APPROVALS NOR DOES IT VERIFY COMPLIANCE WITH ANY APPLICABLE SHORELAND ZONING ORDINANCES.

DONE AND DATED IN AUGUSTA, MAINE, THIS 22 DAY OF March, 2013.

DEPARTMENT OF ENVIRONMENTAL PROTECTION

PLEASE NOTE THE ATTACHED SHEET FOR GUIDANCE ON APPEAL PROCEDURES...

CGW/L20775TA&UN/ATS#74936&74937

Department of Environmental Protection

SITE LOCATION OF DEVELOPMENT (SITE)
STANDARD CONDITIONS

A. **Approval of Variations from Plans.** The granting of this approval is dependent upon and limited to the proposals and plans contained in the application and supporting documents submitted and affirmed to by the applicant. Any variation from these plans, proposals, and supporting documents is subject to review and approval prior to implementation. Further subdivision of proposed lots by the applicant or future owners is specifically prohibited without prior approval of the Board, and the applicant shall include deed restrictions to that effect.

B. **Compliance with All Applicable Laws.** The applicant shall secure and comply with all applicable federal, state, and local licenses, permits, authorizations, conditions, agreements, and orders prior to or during construction and operation, as appropriate.

C. **Compliance with All Terms and Conditions of Approval.** The applicant shall submit all reports and information requested by the Board or the Department demonstrating that the applicant has complied or will comply with all preconstruction terms and conditions of this approval. All preconstruction terms and conditions must be met before construction begins.

D. **Advertising.** Advertising relating to matters included in this application shall refer to this approval only if it notes that the approval has been granted WITH CONDITIONS, and indicates where copies of those conditions may be obtained.

E. **Transfer of Development.** Unless otherwise provided in this approval, the applicant shall not sell, lease, assign or otherwise transfer the development or any portion thereof without prior written approval of the Board where the purpose or consequence of the transfer is to transfer any of the obligations of the developer as incorporated in this approval. Such approval shall be granted only if the applicant or transferee demonstrates to the Board that the transferee has the technical capacity and financial ability to comply with conditions of this approval and the proposals and plans contained in the application and supporting documents submitted by the applicant.

F. **Time frame for approvals.** If the construction or operation of the activity is not begun within four years, this approval shall lapse and the applicant shall reapply to the Board for a new approval. The applicant may not begin construction or operation of the development until a new approval is granted. A reapplication for approval may include information submitted in the initial application by reference. This approval, if construction is begun within the four-year time frame, is valid for seven years. If construction is not completed within the seven-year time frame, the applicant must reapply for, and receive, approval prior to continuing construction.

G. **Approval Included in Contract Bids.** A copy of this approval must be included in or attached to all contract bid specifications for the development.

H. **Approval Shown to Contractors.** Work done by a contractor pursuant to this approval shall not begin before the contractor has been shown by the developer a copy of this approval.

Natural Resource Protection Act (NRPA)
Standard Conditions

THE FOLLOWING STANDARD CONDITIONS SHALL APPLY TO ALL PERMITS GRANTED UNDER THE NATURAL RESOURCE PROTECTION ACT, TITLE 38, M.R.S.A. SECTION 480-A ET.SEQ. UNLESS OTHERWISE SPECIFICALLY STATED IN THE PERMIT.

A. Approval of Variations From Plans. The granting of this permit is dependent upon and limited to the proposals and plans contained in the application and supporting documents submitted and affirmed to by the applicant. Any variation from these plans, proposals, and supporting documents is subject to review and approval prior to implementation.

B. Compliance With All Applicable Laws. The applicant shall secure and comply with all applicable federal, state, and local licenses, permits, authorizations, conditions, agreements, and orders prior to or during construction and operation, as appropriate.

C. Erosion Control. The applicant shall take all necessary measures to ensure that his activities or those of his agents do not result in measurable erosion of soils on the site during the construction and operation of the project covered by this Approval.

D. Compliance With Conditions. Should the project be found, at any time, not to be in compliance with any of the Conditions of this Approval, or should the applicant construct or operate this development in any way other the specified in the Application or Supporting Documents, as modified by the Conditions of this Approval, then the terms of this Approval shall be considered to have been violated.

E. Time frame for approvals. If construction or operation of the activity is not begun within four years, this permit shall lapse and the applicant shall reapply to the Board for a new permit. The applicant may not begin construction or operation of the activity until a new permit is granted. Reapplications for permits may include information submitted in the initial application by reference. This approval, if construction is begun within the four-year time frame, is valid for seven years. If construction is not completed within the seven-year time frame, the applicant must reapply for, and receive, approval prior to continuing construction.

F. No Construction Equipment Below High Water. No construction equipment used in the undertaking of an approved activity is allowed below the mean high water line unless otherwise specified by this permit.

G. Permit Included In Contract Bids. A copy of this permit must be included in or attached to all contract bid specifications for the approved activity.

H. Permit Shown To Contractor. Work done by a contractor pursuant to this permit shall not begin before the contractor has been shown by the applicant a copy of this permit.

STORMWATER STANDARD CONDITIONS

STRICT CONFORMANCE WITH THE STANDARD AND SPECIAL CONDITIONS OF THIS APPROVAL IS NECESSARY FOR THE PROJECT TO MEET THE STATUTORY CRITERIA FOR APPROVAL

Standard conditions of approval. Unless otherwise specifically stated in the approval, a department approval is subject to the following standard conditions pursuant to Chapter 500 Stormwater Management Law.

(1) Approval of variations from plans. The granting of this approval is dependent upon and limited to the proposals and plans contained in the application and supporting documents submitted and affirmed to by the applicant. Any variation from these plans, proposals, and supporting documents must be reviewed and approved by the department prior to implementation. Any variation undertaken without approval of the department is in violation of 38 M.R.S.A. §420-D(8) and is subject to penalties under 38 M.R.S.A. §349.

(2) Compliance with all terms and conditions of approval. The applicant shall submit all reports and information requested by the department demonstrating that the applicant has complied or will comply with all terms and conditions of this approval. All preconstruction terms and conditions must be met before construction begins.

(3) Advertising. Advertising relating to matters included in this application may not refer to this approval unless it notes that the approval has been granted WITH CONDITIONS, and indicates where copies of those conditions may be obtained.

(4) Transfer of project. Unless otherwise provided in this approval, the applicant may not sell, lease, assign, or otherwise transfer the project or any portion thereof without written approval by the department where the purpose or consequence of the transfer is to transfer any of the obligations of the developer as incorporated in this approval. Such approval may only be granted if the applicant or transferee demonstrates to the department that the transferee agrees to comply with conditions of this approval and the proposals and plans contained in the application and supporting documents submitted by the applicant. Approval of a transfer of the permit must be applied for no later than two weeks after any transfer of property subject to the license.

(5) Time frame for approvals. If the construction or operation of the activity is not begun within four years, this approval shall lapse and the applicant shall reapply to the department for a new approval. The applicant may not begin construction or operation of the project until a new approval is granted. A reapplication for approval may include information submitted in the initial application by reference. This approval, if construction is begun within the four-year time frame, is valid for seven years. If construction is not completed within the seven-year time frame, the applicant must reapply for, and receive, approval prior to continuing construction.

(6) Certification. Contracts must specify that "all work is to comply with the conditions of the Stormwater Permit." Work done by a contractor or subcontractor pursuant to this approval may not begin before the contractor and any subcontractors have been shown a copy of this

approval with the conditions by the developer, and the owner and each contractor and subcontractor has certified, on a form provided by the department, that the approval and conditions have been received and read, and that the work will be carried out in accordance with the approval and conditions. Completed certification forms must be forwarded to the department.

(7) Maintenance. The components of the stormwater management system must be adequately maintained to ensure that the system operates as designed, and as approved by the department.

(8) Recertification requirement. Within three months of the expiration of each five-year interval from the date of issuance of the permit, the permittee shall certify the following to the department.

(a) All areas of the project site have been inspected for areas of erosion, and appropriate steps have been taken to permanently stabilize these areas.

(b) All aspects of the stormwater control system have been inspected for damage, wear, and malfunction, and appropriate steps have been taken to repair or replace the facilities.

(c) The erosion and stormwater maintenance plan for the site is being implemented as written, or modifications to the plan have been submitted to and approved by the department, and the maintenance log is being maintained.

(9) Severability. The invalidity or unenforceability of any provision, or part thereof, of this permit shall not affect the remainder of the provision or any other provisions. This permit shall be construed and enforced in all respects as if such invalid or unenforceable provision or part thereof had been omitted.

November 16, 2005 (revised December 27, 2011)

DEP INFORMATION SHEET

Appealing a Department Licensing Decision

Dated: March 2012 **Contact: (207) 287-2811**

SUMMARY

There are two methods available to an aggrieved person seeking to appeal a licensing decision made by the Department of Environmental Protection's ("DEP") Commissioner: (1) in an administrative process before the Board of Environmental Protection ("Board"); or (2) in a judicial process before Maine's Superior Court. An aggrieved person seeking review of a licensing decision over which the Board had original jurisdiction may seek judicial review in Maine's Superior Court.

A judicial appeal of final action by the Commissioner or the Board regarding an application for an expedited wind energy development (35-A M.R.S.A. § 3451(4)) or a general permit for an offshore wind energy demonstration project (38 M.R.S.A. § 480-HH(1)) or a general permit for a tidal energy demonstration project (38 M.R.S.A. § 636-A) must be taken to the Supreme Judicial Court sitting as the Law Court.

This INFORMATION SHEET, in conjunction with a review of the statutory and regulatory provisions referred to herein, can help a person to understand his or her rights and obligations in filing an administrative or judicial appeal.

I. ADMINISTRATIVE APPEALS TO THE BOARD

LEGAL REFERENCES

The laws concerning the DEP's *Organization and Powers*, 38 M.R.S.A. §§ 341-D(4) & 346, the *Maine Administrative Procedure Act*, 5 M.R.S.A. § 11001, and the DEP's *Rules Concerning the Processing of Applications and Other Administrative Matters* ("Chapter 2"), 06-096 CMR 2 (April 1, 2003).

HOW LONG YOU HAVE TO SUBMIT AN APPEAL TO THE BOARD

The Board must receive a written appeal within 30 days of the date on which the Commissioner's decision was filed with the Board. Appeals filed after 30 calendar days of the date on which the Commissioner's decision was filed with the Board will be rejected.

HOW TO SUBMIT AN APPEAL TO THE BOARD

Signed original appeal documents must be sent to: Chair, Board of Environmental Protection, c/o Department of Environmental Protection, 17 State House Station, Augusta, ME 04333-0017; faxes are acceptable for purposes of meeting the deadline when followed by the Board's receipt of mailed original documents within five (5) working days. Receipt on a particular day must be by 5:00 PM at DEP's offices in Augusta; materials received after 5:00 PM are not considered received until the following day. The person appealing a licensing decision must also send the DEP's Commissioner a copy of the appeal documents and if the person appealing is not the applicant in the license proceeding at issue the applicant must also be sent a copy of the appeal documents. All of the information listed in the next section must be submitted at the time the appeal is filed. Only the extraordinary circumstances described at the end of that section will justify evidence not in the DEP's record at the time of decision being added to the record for consideration by the Board as part of an appeal.

WHAT YOUR APPEAL PAPERWORK MUST CONTAIN

Appeal materials must contain the following information at the time submitted:

1. *Aggrieved Status.* The appeal must explain how the person filing the appeal has standing to maintain an appeal. This requires an explanation of how the person filing the appeal may suffer a particularized injury as a result of the Commissioner's decision.
2. *The findings, conclusions or conditions objected to or believed to be in error.* Specific references and facts regarding the appellant's issues with the decision must be provided in the notice of appeal.
3. *The basis of the objections or challenge.* If possible, specific regulations, statutes or other facts should be referenced. This may include citing omissions of relevant requirements, and errors believed to have been made in interpretations, conclusions, and relevant requirements.
4. *The remedy sought.* This can range from reversal of the Commissioner's decision on the license or permit to changes in specific permit conditions.
5. *All the matters to be contested.* The Board will limit its consideration to those arguments specifically raised in the written notice of appeal.
6. *Request for hearing.* The Board will hear presentations on appeals at its regularly scheduled meetings, unless a public hearing on the appeal is requested and granted. A request for public hearing on an appeal must be filed as part of the notice of appeal.
7. *New or additional evidence to be offered.* The Board may allow new or additional evidence, referred to as supplemental evidence, to be considered by the Board in an appeal only when the evidence is relevant and material and that the person seeking to add information to the record can show due diligence in bringing the evidence to the DEP's attention at the earliest possible time in the licensing process or that the evidence itself is newly discovered and could not have been presented earlier in the process. Specific requirements for additional evidence are found in Chapter 2.

Other Considerations in Appealing a Decision to the Board

1. *Be familiar with all relevant material in the DEP record.* A license application file is public information, subject to any applicable statutory exceptions, made easily accessible by DEP. Upon request, the DEP will make the material available during normal working hours, provide space to review the file, and provide opportunity for photocopying materials. There is a charge for copies or copying services.
2. *Be familiar with the regulations and laws under which the application was processed, and the procedural rules governing your appeal.* DEP staff will provide this information on request and answer questions regarding applicable requirements.
3. *The filing of an appeal does not operate as a stay to any decision.* If a license has been granted and it has been appealed the license normally remains in effect pending the processing of the appeal. A license holder may proceed with a project pending the outcome of an appeal but the license holder runs the risk of the decision being reversed or modified as a result of the appeal.

What to Expect Once You File a Timely Appeal with the Board

The Board will formally acknowledge receipt of an appeal, including the name of the DEP project manager assigned to the specific appeal. The notice of appeal, any materials accepted by the Board Chair as supplementary evidence, and any materials submitted in response to the appeal will be sent to Board members with a recommendation from DEP staff. Persons filing appeals and interested persons are notified in advance of the date set for Board consideration of an appeal or request for public hearing. With or without holding a public hearing, the Board may affirm, amend, or reverse a Commissioner decision or remand the matter to the Commissioner for further proceedings. The Board will notify the appellant, a license holder, and interested persons of its decision.

II. JUDICIAL APPEALS

Maine law generally allows aggrieved persons to appeal final Commissioner or Board licensing decisions to Maine's Superior Court, see 38 M.R.S.A. § 346(1); 06-096 CMR 2; 5 M.R.S.A. § 11001; & M.R. Civ. P 80C. A party's appeal must be filed with the Superior Court within 30 days of receipt of notice of the Board's or the Commissioner's decision. For any other person, an appeal must be filed within 40 days of the date the decision was rendered. Failure to file a timely appeal will result in the Board's or the Commissioner's decision becoming final.

An appeal to court of a license decision regarding an expedited wind energy development, a general permit for an offshore wind energy demonstration project, or a general permit for a tidal energy demonstration project may only be taken directly to the Maine Supreme Judicial Court. See 38 M.R.S.A. § 346(4).

Maine's Administrative Procedure Act, DEP statutes governing a particular matter, and the Maine Rules of Civil Procedure must be consulted for the substantive and procedural details applicable to judicial appeals.

ADDITIONAL INFORMATION

If you have questions or need additional information on the appeal process, for administrative appeals contact the Board's Executive Analyst at (207) 287-2452 or for judicial appeals contact the court clerk's office in which your appeal will be filed.

Note: The DEP provides this INFORMATION SHEET for general guidance only; it is not intended for use as a legal reference. Maine law governs an appellant's rights.

STATE OF MAINE
DEPARTMENT OF ENVIRONMENTAL PROTECTION
17 STATE HOUSE STATION AUGUSTA, MAINE 04333-0017

DEPARTMENT ORDER

IN THE MATTER OF

MERCY HOSPITAL	) SITE LOCATION OF DEVELOPMENT ACT
Portland, Cumberland County	) NATURAL RESOURCES PROTECTION ACT
HOSPITAL RELOCATION	) WATER QUALITY CERTIFICATION
L-20775-19-W-B (approval)	) MINOR AMENDMENT
L-20775-TG-X-M (approval)	) FINDINGS OF FACT AND ORDER

Pursuant to the provisions of 38 M.R.S. §§ 481–489-E, §§ 480-A–480-JJ, and Section 401 of the Federal Water Pollution Control Act (33 U. S. C. § 1341), and Chapters 310, 371-376, 500, and 501 of Department rules, the Department of Environmental Protection has considered the application of MERCY HOSPITAL with the supportive data and other related materials on file and FINDS THE FOLLOWING FACTS:

1. PROJECT DESCRIPTION:

A. History: In Department Order #L-20775-19-A-N/L-20775-TG-B-N, dated June 26, 2002, the Department approved the development of a new Mercy Hospital Campus on 85.5 acres off Congress Street, adjacent to the Fore River in Portland. In Department Orders #L-20775-19-C-T, #L-20775-19-D-M, and #L-20775-TG-E-M, the Department approved the partial transfer and modification of the original Orders by the Maine Department of Transportation (MDOT) for the construction of a connector road, the Fore River Parkway, across the property. Approximately three acres of land were transferred to MDOT for the construction of the new Veteran's Bridge to South Portland. Subsequent Department Orders approved several minor modifications. In Department Order #L-20775-19-T-A/L-20775-TG-U-N, dated March 22, 2013, the Department approved the construction of Phase II of the Mercy Hospital relocation project that consists of a 116,980 square-foot hospital building expansion, a 15,000 square-foot medical office building, a detached 40,000 square-foot medical office building, a 33,800 square-foot parking garage, a 51,800 square-foot parking garage, an elevated parking deck, associated on-site traffic circulation and utility renovations, and new stormwater management structures. The Department also approved the placement of 3.49 acres of fill in a freshwater wetland under the Natural Resources Protection Act.

B. Summary: The applicant is proposing to extend start of construction for Department Order #L-20775-19-T-A/L-20775-TG-U-N an additional four years and stormwater structure amendments to meet current stormwater standards. Start of construction has been delayed due to extenuating circumstances. The Department's Chapter 2 Rule Concerning the Processing of Applications and Other Administrative Matters requires that renewal applications to extend the expiration date for projects that have not commenced construction be subject to the procedural and substantive requirements in effect at the time of acceptance of the renewal application. Therefore, in order to extend the permits, the applicant is also proposing to amend the stormwater

management plan portion of Department Order #L-20775-19-T-A to meet current standards. No change in the amount of impervious or developed area is proposed as part of these amendments. The project is shown on a set of plans, the first of which is titled "Site Development Plans for Mercy Hospital Relocation Project Amended Master Plan/Phase II Expansion", prepared by DeLuca-Hoffman Associates, and dated May 2012. Proposed changes to the stormwater management plan are shown on sheet numbers C-4.0, C-4.1, C-4.2, C-4.4, C-4.5, and C-7.4 of this plan set, with a most recent revision date on any of the sheets of October 19, 2017.

2. STORMWATER MANAGEMENT:

The applicant submitted an amended stormwater management plan to meet current Chapter 500 Department Rules. Changes to the plan include the replacement of Tree Box Filters which are no longer approved by the Department. The applicant proposes to replace the Tree Box Filters with one four-foot by eight-foot and two six-foot by 10-foot Filterra Bioretention Systems. Additionally, the applicant proposes to redesign and enlarge the sand filter originally approved to meet the current maximum storage depth standard of 18 inches. The applicant further proposes to redesign the two grassed underdrained soil filters originally approved to meet the current maximum surface area standard of 3,000 square feet. No changes to the amount of impervious or developed area are proposed.

A. Basic Standards:

No changes to this section of Department Order #L-20775-19-T-A are proposed.

B. General Standard:

The applicant's stormwater management plan includes general treatment measures that will mitigate for the increased frequency and duration of channel erosive flows due to runoff from smaller storms, provide for effective treatment of pollutants in stormwater, and mitigate potential thermal impacts. The applicant is proposing to amend the stormwater management plan to meet current General Standards requirements in Chapter 500. The amended plan replaces the previously approved Tree Box Filters with Filterra Bioretention treatment units, redesign of the sand filter to meet the maximum storage depth of 18 inches, and redesign of the grassed underdrained soil filters to meet the maximum allowable 3,000 square feet of surface area. The applicant submitted calculations demonstrating that the revised plans will treat stormwater runoff from 95% of the total impervious area and 96% of the total developed area.

The proposed amendments to the stormwater management system were reviewed by the Bureau of Land Resources (BLR). After final review, BLR commented that the amended stormwater management systems are designed in accordance with the Chapter 500 General Standard provided that the applicant's design engineer, or other qualified engineer, oversee the construction of the stormwater management structures to ensure that they are installed according to the details and notes specified on the approved plans

and provided that prior to the start of construction, the applicant submits a five-year binding inspection and maintenance contract for the Filterra Bioretention Systems to the BLR for review and approval. These contracts must be renewed before expiration. Within 30 days of completion of the entire stormwater management system or if the project takes more than one year to complete, at least once per year, the applicant must submit a log of inspection reports detailing the items inspected, photos taken, and the dates of each inspection to the BLR for review.

Based on the stormwater system's design and BLR's review, the Department finds that the applicant has made adequate provision to ensure that the proposed project will meet the General Standards contained in Chapter 500(4)(C) provided that construction of the stormwater structures is overseen and documented as described above and that the applicant submits a five-year binding inspection and maintenance contract for the Filterra Bioretention Systems to the BLR prior to the start of construction.

C. Flooding Standard:

No changes to this section of Department Order #L-20775-19-T-A are proposed.

3. WETLAND IMPACTS:

No changes to Department Order #L-20775-TG-U-N are proposed.

4. ALL OTHER:

All other findings of fact, conclusions, and conditions remain as approved in Department Order #L-20775-19-A-N/L-20775-TG-B-N, and subsequent Orders.

BASED on the above findings of fact, and subject to the conditions listed below, the Department makes the following conclusions pursuant to 38 M.R.S. §§ 480-A–480-JJ and Section 401 of the Federal Water Pollution Control Act:

A. The proposed activity will not unreasonably interfere with existing scenic, aesthetic, recreational, or navigational uses.

B. The proposed activity will not cause unreasonable erosion of soil or sediment.

C. The proposed activity will not unreasonably inhibit the natural transfer of soil from the terrestrial to the marine or freshwater environment.

D. The proposed activity will not unreasonably harm any significant wildlife habitat, freshwater wetland plant habitat, threatened or endangered plant habitat, aquatic habitat, travel corridor, freshwater, estuarine, or marine fisheries or other aquatic life.

E. The proposed activity will not unreasonably interfere with the natural flow of any surface or subsurface waters.

F. The proposed activity will not violate any state water quality law including those governing the classifications of the State's waters.

G. The proposed activity will not unreasonably cause or increase the flooding of the alteration area or adjacent properties.

H. The proposed activity is not on or adjacent to a sand dune.

I. The proposed activity is not on an outstanding river segment as noted in 38 M.R.S. Section 480-P.

BASED on the above findings of fact, and subject to the conditions listed below, the Department makes the following conclusions pursuant to 38 M.R.S. §§ 481–489-E:

A. The applicant has provided adequate evidence of financial capacity and technical ability to develop the project in a manner consistent with state environmental standards.

B. The applicant has made adequate provision for fitting the development harmoniously into the existing natural environment and the development will not adversely affect existing uses, scenic character, air quality, water quality or other natural resources in the municipality or in neighboring municipalities.

C. The proposed development will be built on soil types which are suitable to the nature of the undertaking and will not cause unreasonable erosion of soil or sediment nor inhibit the natural transfer of soil.

D. The proposed development meets the standards for storm water management in Section 420-D and the standard for erosion and sedimentation control in Section 420-C provided that construction of the stormwater structures is overseen and documented as described in Finding 2, provided that prior to the start of construction the applicant submits a five-year binding inspection and maintenance contract for the Filterra Bioretention Systems to the BLR for review and approval, and provided that the contract is renewed prior to expiration.

E. The proposed development will not pose an unreasonable risk that a discharge to a significant groundwater aquifer will occur.

F. The applicant has made adequate provision of utilities, including water supplies, sewerage facilities and solid waste disposal required for the development and the development will not have an unreasonable adverse effect on the existing or proposed utilities in the municipality or area served by those services.

G. The activity will not unreasonably cause or increase the flooding of the alteration area or adjacent properties nor create an unreasonable flood hazard to any structure.

THEREFORE, the Department APPROVES the application of MERCY HOSPITAL for a permit extension and stormwater structure amendments SUBJECT TO THE FOLLOWING CONDITIONS and all applicable standards and regulations:

1. The Standard Conditions of Approval, a copy attached.

2. In addition to any specific erosion control measures described in this or previous orders, the applicant shall take all necessary actions to ensure that its activities or those of its agents do not result in noticeable erosion of soils or fugitive dust emissions on the site during the construction and operation of the project covered by this approval.

3. Severability. The invalidity or unenforceability of any provision, or part thereof, of this License shall not affect the remainder of the provision or any other provisions. This License shall be construed and enforced in all respects as if such invalid or unenforceable provision or part thereof had been omitted.

4. The applicant shall retain the services of a professional engineer to inspect and document the installation of the Filterra Bioretention Systems according to the details and notes specified on the approved plans. Within 30 days of completion of the stormwater management system or if the project takes more than one year to complete at least once per year, the applicant shall submit a log of inspection reports detailing the items inspected, photographs taken, and dates of each inspection to the BLR for review.

5. Prior to the start of construction, the applicant shall submit a five-year binding inspection and maintenance contract for the Filterra Bioretention Systems to the BLR for review and approval, and that contract shall be renewed before expiration.

6. All other Findings of Fact, Conclusions, and Conditions remain as approved in Department Order #L-20775-19-A-N/L-20775-TG-B-N, and subsequent Orders, and are incorporated herein.

THIS APPROVAL DOES NOT CONSTITUTE OR SUBSTITUTE FOR ANY OTHER REQUIRED STATE, FEDERAL OR LOCAL APPROVALS NOR DOES IT VERIFY COMPLIANCE WITH ANY APPLICABLE SHORELAND ZONING ORDINANCES.

DONE AND DATED IN AUGUSTA, MAINE, THIS 27TH DAY OF NOVEMBER, 2017.

DEP SITE LOCATION OF DEVELOPMENT (SITE) STANDARD CONDITIONS

STRICT CONFORMANCE WITH THE STANDARD AND SPECIAL CONDITIONS OF THIS APPROVAL IS NECESSARY FOR THE PROJECT TO MEET THE STATUTORY CRITERIA FOR APPROVAL.

A. Approval of Variations from Plans. The granting of this approval is dependent upon and limited to the proposals and plans contained in the application and supporting documents submitted and affirmed to by the applicant. Any variation from these plans, proposals, and supporting documents is subject to review and approval prior to implementation. Further subdivision of proposed lots by the applicant or future owners is specifically prohibited without prior approval of the Board, and the applicant shall include deed restrictions to that effect.

B. Compliance with All Applicable Laws. The applicant shall secure and comply with all applicable federal, state, and local licenses, permits, authorizations, conditions, agreements, and orders prior to or during construction and operation, as appropriate.

C. Compliance with All Terms and Conditions of Approval. The applicant shall submit all reports and information requested by the Board or the Department demonstrating that the applicant has complied or will comply with all preconstruction terms and conditions of this approval. All preconstruction terms and conditions must be met before construction begins.

D. Advertising. Advertising relating to matters included in this application shall refer to this approval only if it notes that the approval has been granted WITH CONDITIONS, and indicates where copies of those conditions may be obtained.

E. Transfer of Development. Unless otherwise provided in this approval, the applicant shall not sell, lease, assign or otherwise transfer the development or any portion thereof without prior written approval of the Board where the purpose or consequence of the transfer is to transfer any of the obligations of the developer as incorporated in this approval. Such approval shall be granted only if the applicant or transferee demonstrates to the Board that the transferee has the technical capacity and financial ability to comply with conditions of this approval and the proposals and plans contained in the application and supporting documents submitted by the applicant.

F. Time frame for approvals. If the construction or operation of the activity is not begun within four years, this approval shall lapse and the applicant shall reapply to the Board for a new approval. The applicant may not begin construction or operation of the development until a new approval is granted. A reapplication for approval may include information submitted in the initial application by reference. This approval, if construction is begun within the four-year time frame, is valid for seven years. If construction is not completed within the seven-year time frame, the applicant must reapply for, and receive, approval prior to continuing construction.

G. Approval Included in Contract Bids. A copy of this approval must be included in or attached to all contract bid specifications for the development.

H. Approval Shown to Contractors. Work done by a contractor pursuant to this approval shall not begin before the contractor has been shown by the developer a copy of this approval.

Natural Resource Protection Act (NRPA)
Standard Conditions

THE FOLLOWING STANDARD CONDITIONS SHALL APPLY TO ALL PERMITS GRANTED UNDER THE NATURAL RESOURCE PROTECTION ACT, TITLE 38, M.R.S.A. SECTION 480-A ET.SEQ. UNLESS OTHERWISE SPECIFICALLY STATED IN THE PERMIT.

A. Approval of Variations From Plans. The granting of this permit is dependent upon and limited to the proposals and plans contained in the application and supporting documents submitted and affirmed to by the applicant. Any variation from these plans, proposals, and supporting documents is subject to review and approval prior to implementation.

B. Compliance With All Applicable Laws. The applicant shall secure and comply with all applicable federal, state, and local licenses, permits, authorizations, conditions, agreements, and orders prior to or during construction and operation, as appropriate.

C. Erosion Control. The applicant shall take all necessary measures to ensure that his activities or those of his agents do not result in measurable erosion of soils on the site during the construction and operation of the project covered by this Approval.

D. Compliance With Conditions. Should the project be found, at any time, not to be in compliance with any of the Conditions of this Approval, or should the applicant construct or operate this development in any way other the specified in the Application or Supporting Documents, as modified by the Conditions of this Approval, then the terms of this Approval shall be considered to have been violated.

E. Time frame for approvals. If construction or operation of the activity is not begun within four years, this permit shall lapse and the applicant shall reapply to the Board for a new permit. The applicant may not begin construction or operation of the activity until a new permit is granted. Reapplications for permits may include information submitted in the initial application by reference. This approval, if construction is begun within the four-year time frame, is valid for seven years. If construction is not completed within the seven-year time frame, the applicant must reapply for, and receive, approval prior to continuing construction.

F. No Construction Equipment Below High Water. No construction equipment used in the undertaking of an approved activity is allowed below the mean high water line unless otherwise specified by this permit.

G. Permit Included In Contract Bids. A copy of this permit must be included in or attached to all contract bid specifications for the approved activity.

H. Permit Shown To Contractor. Work done by a contractor pursuant to this permit shall not begin before the contractor has been shown by the applicant a copy of this permit.

DEP INFORMATION SHEET

Appealing a Department Licensing Decision

Dated: March 2012 **Contact: (207) 287-2811**

SUMMARY

There are two methods available to an aggrieved person seeking to appeal a licensing decision made by the Department of Environmental Protection's ("DEP") Commissioner: (1) in an administrative process before the Board of Environmental Protection ("Board"); or (2) in a judicial process before Maine's Superior Court. An aggrieved person seeking review of a licensing decision over which the Board had original jurisdiction may seek judicial review in Maine's Superior Court.

A judicial appeal of final action by the Commissioner or the Board regarding an application for an expedited wind energy development (35-A M.R.S.A. § 3451(4)) or a general permit for an offshore wind energy demonstration project (38 M.R.S.A. § 480-HH(1)) or a general permit for a tidal energy demonstration project (38 M.R.S.A. § 636-A) must be taken to the Supreme Judicial Court sitting as the Law Court.

This INFORMATION SHEET, in conjunction with a review of the statutory and regulatory provisions referred to herein, can help a person to understand his or her rights and obligations in filing an administrative or judicial appeal.

I. ADMINISTRATIVE APPEALS TO THE BOARD

LEGAL REFERENCES

The laws concerning the DEP's *Organization and Powers*, 38 M.R.S.A. §§ 341-D(4) & 346, the *Maine Administrative Procedure Act*, 5 M.R.S.A. § 11001, and the DEP's *Rules Concerning the Processing of Applications and Other Administrative Matters* ("Chapter 2"), 06-096 CMR 2 (April 1, 2003).

HOW LONG YOU HAVE TO SUBMIT AN APPEAL TO THE BOARD

The Board must receive a written appeal within 30 days of the date on which the Commissioner's decision was filed with the Board. Appeals filed after 30 calendar days of the date on which the Commissioner's decision was filed with the Board will be rejected.

HOW TO SUBMIT AN APPEAL TO THE BOARD

Signed original appeal documents must be sent to: Chair, Board of Environmental Protection, c/o Department of Environmental Protection, 17 State House Station, Augusta, ME 04333-0017; faxes are acceptable for purposes of meeting the deadline when followed by the Board's receipt of mailed original documents within five (5) working days. Receipt on a particular day must be by 5:00 PM at DEP's offices in Augusta; materials received after 5:00 PM are not considered received until the following day. The person appealing a licensing decision must also send the DEP's Commissioner a copy of the appeal documents and if the person appealing is not the applicant in the license proceeding at issue the applicant must also be sent a copy of the appeal documents. All of the information listed in the next section must be submitted at the time the appeal is filed. Only the extraordinary circumstances described at the end of that section will justify evidence not in the DEP's record at the time of decision being added to the record for consideration by the Board as part of an appeal.

WHAT YOUR APPEAL PAPERWORK MUST CONTAIN

Appeal materials must contain the following information at the time submitted:

1. *Aggrieved Status*. The appeal must explain how the person filing the appeal has standing to maintain an appeal. This requires an explanation of how the person filing the appeal may suffer a particularized injury as a result of the Commissioner's decision.
2. *The findings, conclusions or conditions objected to or believed to be in error.* Specific references and facts regarding the appellant's issues with the decision must be provided in the notice of appeal.
3. *The basis of the objections or challenge.* If possible, specific regulations, statutes or other facts should be referenced. This may include citing omissions of relevant requirements, and errors believed to have been made in interpretations, conclusions, and relevant requirements.
4. *The remedy sought.* This can range from reversal of the Commissioner's decision on the license or permit to changes in specific permit conditions.
5. *All the matters to be contested*. The Board will limit its consideration to those arguments specifically raised in the written notice of appeal.
6. *Request for hearing.* The Board will hear presentations on appeals at its regularly scheduled meetings, unless a public hearing on the appeal is requested and granted. A request for public hearing on an appeal must be filed as part of the notice of appeal.
7. *New or additional evidence to be offered.* The Board may allow new or additional evidence, referred to as supplemental evidence, to be considered by the Board in an appeal only when the evidence is relevant and material and that the person seeking to add information to the record can show due diligence in bringing the evidence to the DEP's attention at the earliest possible time in the licensing process or that the evidence itself is newly discovered and could not have been presented earlier in the process. Specific requirements for additional evidence are found in Chapter 2.

OTHER CONSIDERATIONS IN APPEALING A DECISION TO THE BOARD

1. *Be familiar with all relevant material in the DEP record.* A license application file is public information, subject to any applicable statutory exceptions, made easily accessible by DEP. Upon request, the DEP will make the material available during normal working hours, provide space to review the file, and provide opportunity for photocopying materials. There is a charge for copies or copying services.
2. *Be familiar with the regulations and laws under which the application was processed, and the procedural rules governing your appeal.* DEP staff will provide this information on request and answer questions regarding applicable requirements.
3. *The filing of an appeal does not operate as a stay to any decision.* If a license has been granted and it has been appealed the license normally remains in effect pending the processing of the appeal. A license holder may proceed with a project pending the outcome of an appeal but the license holder runs the risk of the decision being reversed or modified as a result of the appeal.

WHAT TO EXPECT ONCE YOU FILE A TIMELY APPEAL WITH THE BOARD

The Board will formally acknowledge receipt of an appeal, including the name of the DEP project manager assigned to the specific appeal. The notice of appeal, any materials accepted by the Board Chair as supplementary evidence, and any materials submitted in response to the appeal will be sent to Board members with a recommendation from DEP staff. Persons filing appeals and interested persons are notified in advance of the date set for Board consideration of an appeal or request for public hearing. With or without holding a public hearing, the Board may affirm, amend, or reverse a Commissioner decision or remand the matter to the Commissioner for further proceedings. The Board will notify the appellant, a license holder, and interested persons of its decision.

II. JUDICIAL APPEALS

Maine law generally allows aggrieved persons to appeal final Commissioner or Board licensing decisions to Maine's Superior Court, see 38 M.R.S.A. § 346(1); 06-096 CMR 2; 5 M.R.S.A. § 11001; & M.R. Civ. P 80C. A party's appeal must be filed with the Superior Court within 30 days of receipt of notice of the Board's or the Commissioner's decision. For any other person, an appeal must be filed within 40 days of the date the decision was rendered. Failure to file a timely appeal will result in the Board's or the Commissioner's decision becoming final.

An appeal to court of a license decision regarding an expedited wind energy development, a general permit for an offshore wind energy demonstration project, or a general permit for a tidal energy demonstration project may only be taken directly to the Maine Supreme Judicial Court. See 38 M.R.S.A. § 346(4).

Maine's Administrative Procedure Act, DEP statutes governing a particular matter, and the Maine Rules of Civil Procedure must be consulted for the substantive and procedural details applicable to judicial appeals.

ADDITIONAL INFORMATION

If you have questions or need additional information on the appeal process, for administrative appeals contact the Board's Executive Analyst at (207) 287-2452 or for judicial appeals contact the court clerk's office in which your appeal will be filed.

Note: The DEP provides this INFORMATION SHEET for general guidance only; it is not intended for use as a legal reference. Maine law governs an appellant's rights.

Att. I

DEPARTMENT OF THE ARMY
NEW ENGLAND DISTRICT, CORPS OF ENGINEERS
696 VIRGINIA ROAD
CONCORD, MASSACHUSETTS 01742-2751

REPLY TO
ATTENTION OF

Regulatory Division
CENAE-R-51
Permit Number: NAE-2012-00084

Robert F. Nutter
Mercy Hospital
144 State Street
Portland, Maine 04101

Dear Mr. Nutter:

Attached are two copies of a Department of the Army permit authorizing your project. **Please sign both copies of the permit and return one signed copy to this office at the address above.** A fee of $100.00 is required. Please enclose a check made payable to "FAO New England District", and return it with the signed permit copy. Please ensure your address and social security number, or tax identification number for businesses, are on the check. The authorized work cannot start until we receive a complete, signed copy of the permit.

You are required to complete and return the attached forms to this office:

1. Preliminary Jurisdictional Determination Form to be submitted along with your signed copy of the permit.
2. Work Start Notification Form at least two weeks before the anticipated work start date.
3. Compliance Certification Form within one month following the completion of the authorized work.

This permit is a limited authorization containing a specific set of conditions. Please read the permit thoroughly to familiarize yourself with those conditions, **including any conditions contained on the attached state water quality certification.** If a contractor does the work for you, both you and the contractor are responsible for ensuring that the work is done in compliance with the permit's terms and conditions, as any violations could result in civil or criminal penalties.

Our verification of this project's wetland delineation under the Corps of Engineers Wetlands Delineation Manual, and its applicable supplement, is valid for a period of five years from the date of this letter unless new information warrants revision of the determination before the expiration date.

A combined Notification of Administrative Appeal Options and Process (NAP) and Request for Appeal (RFA) form, and flow chart explaining the appeals process and your options, are attached to this letter. If you desire to appeal this proffered permit, you must submit a completed RFA form along with any supporting or clarifying information to Michael G.

Engineers; North Atlantic Fort Hamilton Military Community, Bldg. 301; General Lee Avenue; Brooklyn, NY 11252-6700. Contact info: (347) 370-4663 or michael.g.vissichelli@usace.army.mil.

In order for an RFA to be accepted by the Corps, the Corps must determine that it is complete, that it meets the criteria for appeal under 33 CFR 331.5, and that it has been received by the Division Office within 60 days of the date of the NAP.

You may not appeal conditions contained in the State water quality certification under this program as they are automatically included in the federal permit. Also note that the Department of the Army permit process does not supersede any other agency's jurisdiction.

We continually strive to improve our customer service. In order for us to better serve you, we would appreciate your completing our Customer Service Survey located at http://per2.nwp.usace.army.mil/survey.html

If you have any questions regarding this correspondence, please contact Jay Clement at 207-623-8367 at our Manchester, Maine Project Office.

Sincerely,

Frank J. Del Giudice
Chief, Permits and Enforcement Branch
Regulatory Division

DEPARTMENT OF THE ARMY PERMIT

Permittee Mercy Hospital, 144 State Street, Portland, Maine 04101

Permit No. NAE-2012-00084

Issuing Office New England District

NOTE: The term "you" and its derivatives, as used in this permit, means the permittee or any future transferee. The term "this office" refers to the appropriate district or division office of the Corps of Engineers having jurisdiction over the permitted activity or the appropriate official of that office acting under the authority of the commanding officer.

You are authorized to perform work in accordance with the terms and conditions specified below.

Project Description:

Fill approximately 3.49 acres of freshwater wetland in order to expand an existing hospital complex. The expansion will include the addition of 250,000 square feet of space to house the Emergency Department, an expanded Acute Care Center, hospital support services, and medical office space. The expansion will allow the applicant to consolidate the two separate facilities into one single campus.

This work is shown on the attached plans entitled, "MERCY AT THE FORE MASTER PLAN", on seven sheets, and dated "March 2001" and "07.10.12".

Project Location:

In freshwater wetlands adjacent to the Fore River at Portland, Maine

Permit Conditions:

General Conditions:

1. The time limit for completing the work authorized ends on December 31, 2017. If you find that you need more time to complete the authorized activity, submit your request for a time extension to this office for consideration at least one month before the above date is reached.

2. You must maintain the activity authorized by this permit in good condition and in conformance with the terms and conditions of this permit. You are not relieved of this requirement if you abandon the permitted activity, although you may make a good faith transfer to a third party in compliance with General Condition 4 below. Should you wish to cease to maintain the authorized activity or should you desire to abandon it without a good faith transfer, you must obtain a modification of this permit from this office, which may require restoration of the area.

3. If you discover any previously unknown historic or archeological remains while accomplishing the activity authorized by this permit, you must immediately notify this office of what you have found. We will initiate the Federal and state coordination required to determine if the remains warrant a recovery effort or if the site is eligible for listing in the National Register of Historic Places.

4. If you sell the property associated with this permit, you must obtain the signature of the new owner in the space provided and forward a copy of the permit to this office to validate the transfer of this authorization.

5. If a conditioned water quality certification has been issued for your project, you must comply with the conditions specified in the certification as special conditions to this permit. For your convenience, a copy of the certification is attached if it contains such conditions.

6. You must allow representatives from this office to inspect the authorized activity at any time deemed necessary to ensure that it is being or has been accomplished in accordance with the terms and conditions of your permit.

Special Conditions:

1. The permittee shall ensure that a copy of this permit is at the work site (and the project office) authorized by this permit whenever work is being performed, and that all personnel with operational control of the site ensure that all appropriate personnel performing work are fully aware of its terms and conditions. The entire permit shall be made a part of any and all contracts and sub-contracts for work that affects areas of Corps jurisdiction at the site of the work authorized by this permit. This shall be achieved by including the entire permit in the specifications for work. The term "entire permit" means this permit (including its drawings, plans, appendices and other attachments) and also includes permit modifications.

(Special conditions continued on Page 4)

Further Information:

1. Congressional Authorities: You have been authorized to undertake the activity described above pursuant to:

( ) Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 403).

X Section 404 of the Clean Water Act (33 U.S.C. 1344).

( ) Section 103 of the Marine Protection, Research and Sanctuaries Act of 1972 (33 U.S.C. 1413).

2. Limits of this authorization.

a. This permit does not obviate the need to obtain other Federal, state, or local authorizations required by law.

b. This permit does not grant any property rights or exclusive privileges.

c. This permit does not authorize any injury to the property or rights of others.

d. This permit does not authorize interference with any existing or proposed Federal project.

3. Limits of Federal Liability. In issuing this permit, the Federal Government does not assume any liability for the following:

a. Damages to the permitted project or uses thereof as a result of other permitted or unpermitted activities or from natural causes.

b. Damages to the permitted project or uses thereof as a result of current or future activities undertaken by or on behalf of the United States in the public interest.

c. Damages to persons, property, or to other permitted or unpermitted activities or structures caused by the activity authorized by this permit.

d. Design or construction deficiencies associated with the permitted work.

e. Damage claims associated with any future modification, suspension, or revocation of this permit.

4. Reliance on Applicant's Data: The determination of this office that issuance of this permit is not contrary to the public interest was made in reliance on the information you provided.

5. Reevaluation of Permit Decision. This office may reevaluate its decision on this permit at any time the circumstances warrant. Circumstances that could require a reevaluation include, but are not limited to, the following:

a. You fail to comply with the terms and conditions of this permit.

b. The information provided by you in support of your permit application proves to have been false, incomplete, or inaccurate (See 4 above).

c. Significant new information surfaces which this office did not consider in reaching the original public interest decision.

Such a reevaluation may result in a determination that it is appropriate to use the suspension, modification, and revocation procedures contained in 33 CFR 325.7 or enforcement procedures such as those contained in 33 CFR 326.4 and 326.5. The referenced enforcement procedures provide for the issuance of an administrative order requiring you to comply with the terms and conditions of your permit and for the initiation of legal action where appropriate. You will be required to pay for any corrective measures ordered by this office, and if you fail to comply with such directive, this office may in certain situations (such as those specified in 33 CFR 209.170) accomplish the corrective measures by contract or otherwise and bill you for the cost.

6. Extensions. General condition 1 establishes a time limit for the completion of the activity authorized by this permit. Unless there are circumstances requiring either a prompt completion of the authorized activity or a reevaluation of the public interest decision, the Corps will normally give favorable consideration to a request for an extension of this time limit.

Your signature below, as permittee, indicates that you accept and agree to comply with the terms and conditions of this permit.

_____ _____

(PERMITTEE) *(DATE)*

This permit becomes effective when the Federal official, designated to act for the Secretary of the Army, has signed below.

Regulatory Division
For District Engineer

When the structures or work authorized by this permit are still in existence at the time the property is transferred, the terms and conditions of this permit will continue to be binding on the new owner(s) of the property. To validate the transfer of this permit and the associated liabilities associated with compliance with its terms and conditions, have the transferee sign and date below.

_____ _____

(TRANSFEREE) *(DATE)*

☆U.S. GOVERNMENT PRINTING OFFICE: 1986 — 717-425

(Special conditions continued from Page 2)

If the permit is issued after the construction specifications, but before receipt of bids or quotes, the entire permit shall be included as an addendum to the specifications. If the permit is issued after receipt of bids or quotes, the entire permit shall be included in the contract or sub-contract. Although the permittee may assign various aspects of the work to different contractors or sub-contractors, all contractors and sub-contractors shall be obligated by contract to comply with all environmental protection provisions contained within the entire permit, and no contract or sub-contract shall require or allow unauthorized work in areas of Corps jurisdiction.

2. The permittee shall complete and return the enclosed Compliance Certification Form within one month following the completion of the authorized work.

3. Adequate sedimentation and erosion control devices, such as geo-textile silt fences or other devices capable of filtering the fines involved, shall be installed and properly maintained to minimize impacts during construction. These devices must be removed upon completion of work and stabilization of disturbed areas. The sediment collected by these devices must also be removed and placed upland, in a manner that will prevent its later erosion and transport to a waterway or wetland.

4. Except where stated otherwise, reports, drawings, correspondence and any other submittals required by this permit shall be marked with the words "Permit No. NAE-2012-00084" and shall be addressed to "Inspection Section, CENAE-R, U.S. Army Corps of Engineers, 696 Virginia Road, Concord, MA 01742-2751." Documents which are not marked and addressed in this manner may not reach their intended destination and do not comply with the requirements of this permit.

5. Mitigation shall consist of payment of $834,156.00 to the Natural Resource Mitigation Fund. The completed ILF Project Data Worksheet which must be mailed with a cashier's check or bank draft, made out to "Treasurer, State of Maine", with the permit number noted on the check. The check and worksheet should be mailed to: ME DEP, Attn: ILF Program Administrator, State House Station 17, Augusta, ME 04333. No project construction may begin until the permittee provides the Corps with a copy of the check, with the permit number noted on the check. The ILF amount is only valid for a period of one year from the date on the authorization letter. After that time, the project would need to be reevaluated and a new amount determined.

6. The introduction, spread, or the increased risk of invasion of non-native invasive plant or animal species on the project site, into new or disturbed areas, or areas adjacent to the project site caused by the site work is prohibited. Prior to being on the construction site,

Special Conditions Continued on Page 5

the contractor shall thoroughly inspect and remove seeds, plant material, soil, mud, insects, and other invertebrates on all equipment, including construction mats, to be used on the project site to prohibit introduction of invasive organisms. At a minimum, the following shall be inspected and cleaned on terrestrial vehicles where applicable:

- ***Rubber Tired Vehicles*** **- Crevices in upper surface and panels, tires, rims, and fender wells, spare tire mounting area, bumpers, front and rear quarter panels, around and behind grills, bottom of radiator vent openings, brake mechanisms, transmission, stabilizer bar, shock absorbers, front and rear axles, beds, suspension units, exhaust systems, light casings, and mirrors.**

- ***Tracked Land Vehicles*** **- Crevices in upper surface and panels, top of axles and tensioners, support rollers, between rubber or gridded areas, beneath fenders, hatches, under casings, and grills.**

- ***Interiors of All Vehicles*** **- Beneath seats, beneath floor mats, upholstery, beneath foot pedals, inside folds of gear shift cover.**

IN-LIEU-FEE (ILF) PROJECT DATA WORKSHEET

DEP Invoice # _____

[Note: Will be filled in by ILF Administrator at DEP]

Project name: Mercy Hospital Expansion

Applicant (s): Mercy Hospital

DEP Permit #: L-20775-TG-U-N; L-20775-19-T-A

Corps Permit #: NAE-2012-00084

ILF Contribution Amount $834,156.00

[Note: Please attach a copy of the check]

Project address: 192 Fore River Parkway; Portland, Maine

Biophysical region: Gulf of Maine Coastal Lowland Subsection

Size of total impact subject to compensation: 191,759 s.f. (4.41 acres)

Resources Impacted: Refer to attached table

DEP Project manager: Woodruff

Corps Project manager: Clement

Corps ILF Processing Procedure:

Within 3 days of final permit approval the Corps project manager MUST send via e-mail to the ILF Administrator at DEP with the following attachments:

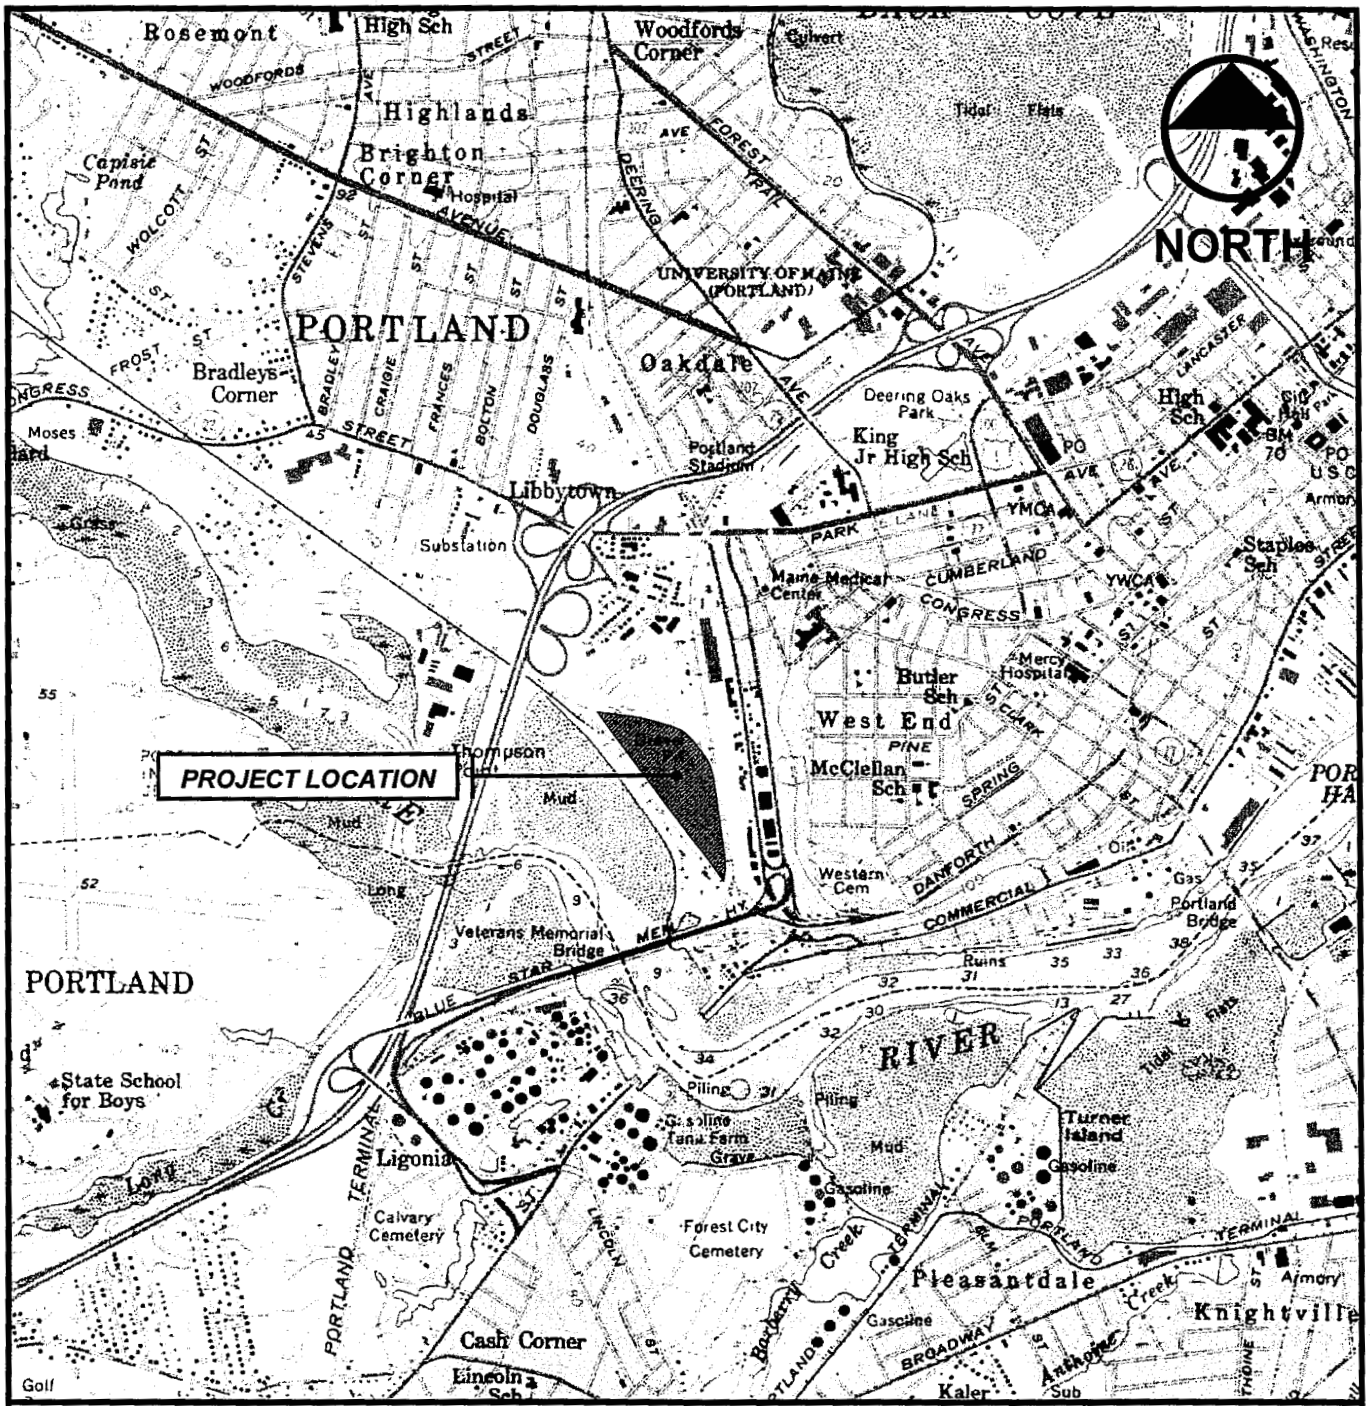
1. **A Microsoft word version of this completed ILF project worksheet including the resource impact table. Please make sure that you double check the information to make sure that the worksheet is accurate and reflects the actual impacts that are stated in the permit and the correct biophysical region.**

   [Note: The DEP Invoice # section of the worksheet should be left blank and will be filled in by the ILF Program Administrator.]

2. **A copy of a location map for the project site. The map MUST be made in GIS and saved as a pdf and MUST include a call out box to physically locate the project site and enough reference information so that project site can be geo-located on the MNRCP GIS data layer.**

3. **A pdf copy of the Corps permit for the project.**

Corps permitees MUST be instructed to send all required ILF payments to the attention of the ILF Administrator Maine Department of Environmental Protection, State House Station 17, Augusta, Maine 04333. All checks must have the ILF program routing # 014.06A.1776.14 on the memo line.



Resource(s) Impacted:

Resource Type: (Wetlands by NWI Type (PFO, PSS, M1, M2, E1, E2, etc), significant vernal pool (SVP), shorebird feeding & staging habitat (Shorebird), inland waterfowl & wading bird habitat (IWWH), tidal waterfowl & wading habitat (TWWH), and river, stream, or brook (RSB).

Wetland Functions & Values: Groundwater recharge/discharge (GWR); floodflow alterations(FF); fish & shellfish habitat (FSH); sediment toxicant retention (STR); nutrient removal (NR); production export (PE); sediment/shoreline stabilization (SS); wildlife habitat (WH); recreation (R); education/scientific value (ESV); uniqueness/heritage (UH); and visual quality/aesthetics (VQ).

Types of impacts: may include filling, dredging, vegetation conversion (e.g. forested to shrub/scrub), others.

Resource type (list all that apply)	**Functions (for wetland impacts)** (list all that apply, by resource type)	**Type of Impact** (by resource type)	**Sq Feet Impacted** (by resource type)

RE: Site Location of Development Act and Natural Resources Protect Act Applications
Portland, DEP #L-20775-19-T-A/L-20775-TG-U-N

Dear Mr. Connolly:

Enclosed is a signed copy of your Department of Environmental Protection land use permit. Please note that the permit includes a description of your project, findings of fact that relate to the approval criteria the Department used in evaluating your project, and conditions that are based on those findings and the particulars of your project. Please take several moments to read your permit carefully, paying particular attention to the conditions of the approval. The Department reviews every application thoroughly and strives to formulate reasonable conditions of approval within the context of the Department's environmental laws. Also attached are some materials that describe the Department's appeal procedures for your information.

If you have any questions about the permit please contact me at (207) 615-6426 or at christine.woodruff@maine.gov.

Sincerely,

Chris Woodruff

DEPARTMENT ORDER

IN THE MATTER OF

MERCY HOSPITAL	) SITE LOCATION OF DEVELOPMENT ACT
Portland, Cumberland County	) NATURAL RESOURCES PROTECTION ACT
PHASE II RELOCATION PROJECT	) TIER 3 WETLAND ALTERATION
L-20775-19-T-A (approval)	) WATER QUALITY CERTIFICATION
L-20775-TG-U-N (approval)	) FINDINGS OF FACT AND ORDER

Pursuant to the provisions of 38 M.R.S.A. Sections 481 et seq. and 480-A et seq., 38 M.R.S.A. Sections 480-A et seq. and Section 401 of the Federal Water Pollution Control Act, the Department of Environmental Protection has considered the application of MERCY HOSPITAL with the supportive data, agency review comments, and other related materials on file and FINDS THE FOLLOWING FACTS:

1. PROJECT DESCRIPTION:

A. History of Project: In Department Order #L-20775-19-A-N/L-20775-TG-B-N, dated June 26, 2002, the Department approved the development of a new Mercy Hospital Campus on 85.5 acres off Congress Street, adjacent to the Fore River in Portland. In Department Orders #L-20775-19-C-T, #L-20775-19-D-M, and #L-20775-TG-E-M, the Department approved the partial transfer and modification of the original Orders by the Maine Department of Transportation for the construction of a connector road, the Fore River Parkway, across the property. Approximately three acres of land was transferred to the Maine Department of Transportation for the construction of the new Veteran's Bridge to South Portland. Subsequent Department Orders approved several minor modifications.

B. Summary: The applicant proposes to construct Phase II of the Mercy Hospital relocation project that consists of a 116,980-square foot hospital building expansion, a 15,000-square foot medical office building, a detached 40,000-square foot medical office building, a 51,800-square foot parking garage, a 33,800-square foot parking garage, an elevated parking deck and associated on-site traffic circulation renovations. The project includes utility service relocations and new stormwater management systems. The two existing site entrances will remain the same. The project is shown on a set of plans, the

first of which is titled "Site Development Plans for Mercy Hospital Fore River Hospital Relocation Project Amended Master Plan / Phase II Expansion," prepared by DeLuca-Hoffman Associates, and dated May 2012, with a last revision date of October 23, 2012. The project is located on the remaining approximately 33 acres of the parcel on the east side of the Fore River Parkway in the City of Portland.

The applicant is also seeking approval under the Natural Resources Protection Act to fill a 3.49-acre freshwater wetland.

C. Current Use of Site: The portion of the site that is east of the Fore River Parkway is completely developed except for the central portion of the site that is occupied by a pond and wetlands. The existing development includes a hospital building, a medical office building, a maintenance building, parking, utilities, and access roads.

2. FINANCIAL CAPACITY:

The total cost of the project is estimated to be $5,378,880.00. The applicant submitted a letter from Eastern Maine Healthcare System, dated February 21, 2013, stating that Eastern Maine Healthcare System and Mercy Health System of Maine executed an affiliation agreement on January 14, 2013, pursuant to which Eastern Maine Healthcare System will become the sole corporate member of Mercy Health System of Maine. Pursuant to terms of the affiliation agreement and subject to the regulatory approval and closure of the transaction, as well as other contractual restrictions, Eastern Maine Healthcare System has committed to spending $115 million in support of Mercy Health System of Maine. This financial support includes expanding the Fore River campus of Mercy Hospital to consolidate Mercy Hospital's State Street facility onto the Fore River campus. Prior to the start of construction, the applicant must submit evidence that it has been granted a line of credit or a loan by a financial institution authorized to do business in this State or evidence of any other form of financial assurance determined by Department Rules, Chapter 373(1), to be adequate to the Bureau of Land and Water Quality (BLWQ) for review and approval as a condition of compliance.

The Department finds that the applicant has demonstrated adequate financial capacity to comply with Department standards provided that the applicant submits evidence of financial capacity to the BLWQ for review and approval prior to the start of construction.

3. TECHNICAL ABILITY:

The applicant provided resume information for key consultants involved with the project and a list of projects successfully constructed by the applicant and the consultants. The applicant retained the services of DeLuca-Hoffman Associates, a professional engineering firm, to provide site design and engineering of the project. Haley and Aldrich provided geotechnical engineering, Normandeau Associates was the wetland consultant, Hoffman Engineering provided environmental engineering, Owen Haskell

provided land surveying services, SMRT provided architectural services and Tewhey Associates was the project manager.

The Department finds that the applicant has demonstrated adequate technical ability to comply with Department standards.

4. NOISE:

The proposed project is primarily the expansion of an existing hospital campus. A hospital is classified as a development producing a minor noise impact. The Department finds that no regulated sources of noise have been identified.

5. SCENIC CHARACTER:

The Mercy Hospital Fore River Campus is located between the Fore River Parkway and an active railroad line. The Cumberland County Jail is across the railroad tracks to the north, commercial development on Saint John Street is across the railroad tracks to the east, the Veterans' Memorial Bridge is to the south and a mud flat and Interstate Route 295 is across the Fore River Parkway to the west. The areas of the proposed project that are not to be covered with structures, parking areas or vehicle circulation facilities will be landscaped and maintained consistent with the current landscaping features including providing landscaped strips within parking lots. The project will be in keeping with the existing buildings, grounds and surrounding scenic character.

Based on the project's location and design, the Department finds that the proposed project will not have an unreasonable adverse effect on the scenic character of the surrounding area.

6. WILDLIFE AND FISHERIES:

The Maine Department of Inland Fisheries and Wildlife (MDIFW) reviewed Phase 1 of the Mercy Hospital project at the Fore River site in 2002 and stated that it found no records of any Essential or Significant Wildlife Habitats, or other wildlife habitats of special concern associated with this site. But MDIFW noted that the wetlands on the site, particularly the pond, was used by several species of waterfowl and wading birds and recommended that impacts to the birds be minimized by maximizing the retention of the existing buffer around the pond and maintaining or elevating the water level of the pond. The 2002 project was constructed to eliminate direct impact to the pond by directing stormwater runoff to other locations and placing a buffer around the pond. Subsequent monitoring of the site since 2006 has documented use by waterfowl (mallards, black ducks), wading birds (green heron, great blue heron), a variety of passerine species (red-winged blackbird, mocking birds, common yellow throat, song sparrow), gulls and painted turtles. Fish have been observed in the pond and mammal signs include grey fox, chipmunks and woodchucks.

As part of the review for the currently proposed expansion project that includes filling of the pond and wetland used by the above noted wildlife, MDIFW visited the site to determine if additional buffering could be added on land owned by Mercy Hospital adjacent to the Fore River on the northwest portion of the site to compensate for the loss of habitat in the pond area. Due to several issues on the land adjacent to the Fore River, it was determined that a buffer that would provide roosting habitat along the Fore River was not feasible. The loss of wetlands as a result of the proposed Phase II will be compensated for through a contribution into the In-Lieu Fee (ILF) program of the Maine Natural Resource Conservation Fund (MNRCF), discussed further in Finding 13. It was determined that the loss of wildlife habitat from the wetland impacts could be compensated for by emphasizing on the ILF Project Data Worksheet that the habitat losses include waterfowl habitat so that the funds could be used towards replacement of the habitat. It was also determined that the resident turtle population in the pond should be relocated. The applicant has developed a Turtle Trapping and Removal plan that followed the recommendations made by MDIFW. The applicant must implement the relocation plan prior to the start of construction and release the turtles to Capisic Pond Park in Portland and/or Evergreen Cemetery on Stevens Avenue in Portland, or to another location with prior approval from MDIFW.

The Department finds that the applicant has made adequate provision for the protection of wildlife and fisheries provided the wildlife habitats are noted on the In Lieu Fee (ILF) Project Data Worksheet and that prior to the start of construction, the Turtle Trapping and Removal plan is implemented as recommended by MDIFW.

7. SOILS:

There are several locations on the site that have lead-contaminated ash from the former railroad operations that have been covered with clean soil or bituminous pavement to prevent direct exposure. The proposed project was reviewed by an Oil and Hazardous Materials Specialist in the Bureau of Remediation and Waste Management (BRWM) in regards to the existing Voluntary Response Action Plan for the site. BRWM concluded that they have no issues with the planned expansion provided that the appropriate precautions are followed during the project to insure that the contaminated ash is handled, placed on site and/or disposed as appropriate and that the necessary cover systems are in place once the project is completed. The current deed restrictions on the property that were placed during Phase I work are consistent with and adequate as future restrictions for the property, and will continue to be subject to the operation and maintenance program with annual inspections.

The applicant has previously submitted a geotechnical report based on the soils found at the project site which was previously reviewed by the Division of Environmental Assessment (DEA).

The Department finds that, based on the comments from the BRWM and DEA's previous review, the soils on the project site present no limitations to the proposed project that cannot be overcome through standard engineering practices.

8. STORMWATER MANAGEMENT:

The proposed project includes approximately 4.12 acres of new impervious area for a total of 19.80 acres of impervious area, and 4.89 acres of new developed area for a total of approximately 29.03 acres of developed area. It lies within the watershed of the tidal waters of the Fore River. The applicant submitted a stormwater management plan based on the Basic, General, and Flooding standards contained in Department Rules, Chapter 500. The proposed stormwater management system consists of an underdrained soil filter, an underdrained bioretention cell, an underdrained subsurface sand filter, and proprietary filters (Filterra ® and StormFilter®).

A. Basic Standards:

(1) Erosion and Sedimentation Control: The applicant submitted an Erosion and Sedimentation Control Plan that is based on the performance standards contained in Appendix A of Chapter 500 and the Best Management Practices (BMPs) outlined in the Maine Erosion and Sediment Control BMPs, which were developed by the Department. This plan and plan sheets containing erosion control details were reviewed by, and revised in response to the comments of, the Division of Land Resource Regulation (DLRR) of the BLWQ.

Erosion control details will be included on the final construction plans and the erosion control narrative will be included in the project specifications to be provided to the construction contractor.

(2) Inspection and Maintenance: The applicant submitted a maintenance plan that addresses both short and long-term maintenance requirements. This plan was reviewed by, and revised in response to the comments of, DLRR. The maintenance plan is based on the standards contained in Appendix B of Chapter 500. The applicant will be responsible for the maintenance of all common facilities including the stormwater management system.

Prior to occupancy of the new buildings, the applicant must submit a copy of an executed long-term maintenance contract (minimum of 5 years and renewable) for the on-going maintenance of the Filterra®, the underdrained subsurface sand filter, and the StormFilter® to the BLWQ. Storm sewer grit and sediment materials removed from any parts of the stormwater management system, including conveyance structures, during maintenance activities must be disposed of in compliance with the Maine Solid Waste Management Rules.

(3) Housekeeping: The proposed project will comply with the performance standards outlined in Appendix C of Chapter 500.

Based on DLRR's review of the erosion and sedimentation control plan and the maintenance plan, the Department finds that the proposed project meets the Basic Standards contained in Chapter 500(4)(A).

B. General Standards:

The applicant's stormwater management plan includes general treatment measures that will mitigate for the increased frequency and duration of channel erosive flows due to runoff from smaller storms, provide for effective treatment of pollutants in stormwater, and mitigate potential temperature impacts. This mitigation is being achieved by using Best Management Practices (BMPs) that will control runoff from 95% of the impervious area and 96% of the developed area.

The stormwater management system proposed by the applicant was reviewed by, and revised in response to comments from, DLRR. After a final review, DLRR commented that the proposed stormwater management system is designed in accordance with the General Standards contained in Chapter 500(4)(B) and recommended that the applicant retain the design engineer, or another qualified engineer, to oversee the construction of the stormwater management structures according to the details and notes specified on the approved plans. Within thirty days of completion of each stormwater management structure, the applicant must submit a log of inspection reports detailing the items inspected, photos taken, and the dates of each inspection to the BLWQ for review.

Based on the stormwater system's design and DLRR's review, the Department finds that the applicant has made adequate provision to ensure that the proposed project will meet the General Standards contained in Chapter 500(4)(B).

C. Flooding Standard:

The applicant is not proposing a formal stormwater management system to detain stormwater from 24-hour storms of 2-, 10-, and 25-year frequency. Instead, since the project site is located adjacent to a tidal section of the Fore River, the applicant requested a waiver from the flooding standard pursuant to Department Rules, Chapter 500(4)(E)(2)(a). DLRR reviewed the request for a waiver of the flooding standard and recommended that the waiver be granted.

The Department finds that the proposed project will meet the Chapter 500 standards for management of stormwater discharges and discharges to coastal wetlands.

9. WATER SUPPLY:

When completed, the proposed expanded project is anticipated to use 63,919 gallons of water per day. Water will be supplied by the Portland Water District. The applicant submitted a letter from the Portland Water District, dated January 2, 2013, indicating that it will be capable of servicing this project.

The Department finds that the applicant has made adequate provision for securing and maintaining a sufficient and healthful water supply.

10. WASTEWATER DISPOSAL:

When completed, the proposed project is anticipated to discharge up to 63,919 gallons of wastewater per day to the Portland Water District's East End wastewater treatment facility. This project was reviewed and approved by the Division of Water Quality Management (DWQM) of the BLWQ, which commented that the East End wastewater treatment facility has the capacity to treat these flows but has some non-compliance issues that are being addressed by the Portland Water District and scrutinized by the Department.

Based on DWQM's comments, the Department finds that the applicant has made adequate provision for wastewater disposal at a facility that has the capacity to ensure satisfactory treatment.

11. SOLID WASTE:

All municipal solid wastes from the proposed project will be disposed of at Ecomaine, which is currently in substantial compliance with the Maine Solid Waste Management Rules. All wood waste generated from site clearing, such as stumps and grubbings, will be ground and used on site. Any treated wood and mixed construction and demolition debris will be transported to Juniper Ridge Landfill in Old Town or Waste Management in Norridgewock. Untreated wood waste from construction will be sent to KTE Biofuels in Lewiston or to the City of Portland Riverside Recycling Facility. Any petroleum-contaminated soils will be transported to CPRC Group in Scarborough. Biomedical waste will be disposed of at Stericycle in Massachusetts. Any chemical waste will be sent to Clean Harbors Waste Disposal Services. Scrap metal will be sent to One Steel located in Arundel and Oakland, or to Schnitzer Steel in Portland. Any coal ash encountered will be handled in accordance with the Voluntary Response Action Plan. The BRWM reviewed this section of the application and found these facilities are in substantial compliance with the Maine Solid Waste Management Rules.

Based on the above information, the Department finds that the applicant has made adequate provision for solid waste disposal.

12. FLOODING:

The project is adjacent to tidal mudflats of the Fore River. The one hundred year flood elevation of the Fore River and Atlantic Ocean is elevation 10.0 (NGVD 29). The pond and the surrounding wetlands in the old excavated gravel pit portion of the site are below elevation 10.0 and could possibly flood from backflow from the Fore River through the storm drain system. After the pond and surrounding wetlands are filled for the proposed project, all the elevations of the site east of the Fore River Parkway will be above the one hundred year flood elevation. This loss of flood plain area in the Fore River watershed is unlikely to cause an increase in the flood elevation of the Fore River and the surrounding areas because the amount of flood plain area loss from the proposed project is very small in comparison to the flood plain area of the Fore River and surrounding tidal areas.

The Department finds that the proposed project is unlikely to cause or increase flooding or cause an unreasonable flood hazard to any structure.

13. WETLAND IMPACTS:

The applicant proposes to alter 151,924 square feet (3.49 acres) of wetlands to construct the proposed project. The types of wetland proposed to be impacted are 63,446 square feet of open water, 51,236 square feet of emergent/open water wetland, 17,298 square feet of forested wetland, 10,895 square feet of shrub/emergent wetland, 6,458 square feet of shrub wetland, and 2,591 square feet of emergent wetland. These wetlands are the existing pond and the surrounding wetlands in the central part of the site that were originally created from gravel extraction below the groundwater table. The pond is considered artificial and is not considered a wetland of special significance. The purpose and need of the wetland impact is to consolidate the operations of the hospital from the existing two campuses, one on State Street and one on the Fore River Parkway, to a single hospital campus on the Fore River Parkway site, which will allow Mercy Hospital to increase the capacity of the hospital for outpatient care and to provide a facility that meets current hospital standards.

In Department Order #L-20775-19-A-N/L-20775-TG-B-N, dated June 26, 2002, the Department approved 39,835 square feet (0.91 acre) of mostly scrub shrub wetland impact for the initial development of the site by the applicant. The cumulative wetland impact for the existing project plus the proposed project is 191,301 square feet (4.40 acres).

The Wetland Protection Rules interpret and elaborate on the NRPA criteria for obtaining a permit. The rules guide the Department in its determination of whether a project's impacts would be unreasonable. A proposed project would generally be found to be unreasonable if it would cause a loss in wetland area, functions and values and there is a practicable alternative to the project that would be less damaging to the environment. Each application for a Natural Resources Protection Act permit that involves a freshwater

wetland alteration must provide an analysis of alternatives in order to demonstrate that a practicable alternative does not exist.

A. Avoidance. No activity may be permitted if there is a practicable alternative to the project that would be less damaging to the environment. The applicant submitted an alternative analysis for the proposed project completed by Normandeau Associates and dated July 2012.

The applicant evaluated using single and dual campus alternatives to bring the hospital up to appropriate standards of care, safety, efficiency, convenience, and cost effectiveness. The applicant examined moving all operations back to the State Street campus; however the existing facility on State Street has the deficiencies of an aging facility including: an internal power distribution system that is antiquated, at-load capacity and in need of replacement; piping systems that need replacement; the two primary chillers of the heating, ventilating and air conditioning system need replacement; and the lack of space for parking is a major issue that includes high costs and inconvenience for patients and employees. Therefore, moving back to a single campus on State Street is not a feasible alternative because it will not meet the project purpose based on the expense and the inability to create a state-of-the-art healthcare facility.

The applicant evaluated moving all operation to a third site. A search was conducted for alternative sites in 2001 and 2002 that found no other local site was feasible or appropriate. The relocation of all operations to a third location is considered not practicable because it would not meet the project purpose of having a facility in Portland and the $90 million invested in the Fore River location could not be recouped which would jeopardize the long-term sustainability of the hospital.

The applicant evaluated maintaining a duel campus, but has found that two campuses perpetuates unfavorable conditions that would render the hospital unsustainable in the long term because of safety issues, operational difficulties, inconvenience, the expenses of duplicated services, bussing between facilities and renovating the State Street facility, and does not meet the project purpose of having a cost-effective, safe, and state-of-the-art healthcare facility.

The applicant evaluated consolidating operations onto the Fore River Campus with the proposed expansion. This would result in a state-of-the-art facility that would be best for healthcare delivery logistics, staff and patient access, reduction in operating costs, increases in staff efficiency, eliminating the need for duplicated services, and could lead to higher employee retention rates. This alternative meets the project purpose, is practicable in terms of cost effectiveness, and provides a state-of-the-art facility.

The applicant evaluated five alternative site layouts for the expanded Fore River campus, which included layouts that partially or completely filled the central wetland. Alternative ONS-3 shown in the project application avoided impacts to the wetland but did not

address current and anticipated future changes in the U.S. healthcare delivery system, including large increases in the amount of outpatient and ambulatory services provided by hospital campuses which would create a need for increased hospital size and more adjacent parking. Therefore, alternative ONS-3 was rejected.

Alternatives ONS-4 thru ONS-7 represented site layouts that minimize impacts to the central wetland, however they result in an unacceptable facility design that significantly limits the hospital's clinical operations. These unacceptable facility designs include congested and unsafe traffic circulation conditions where the Ambulatory Care Center and Emergency Department entrances are immediately adjacent to one another and other traffic circulation problems that result in confusion and congestion problems for incoming patients and visitors. These designs do not provide parking structures that are located in the critically essential location immediately adjacent to the ambulatory care center. These alternatives would also encroach on the wetland. One of the primary functions and values of the wetland is wildlife habitat, and it was recognized that direct encroachment on the wetland, shading of the wetland, and human activities associated with the building in closer proximity to the wetland would likely have a detrimental effect on this wetland function and value. Although these alternatives would have less direct wetland impact than the proposed project, these alternatives were deemed impracticable for the delivery of patient care services and would likely have detrimental effect on the wetland's wildlife functions and values.

Alternative ONS-8 is the basis of the proposed project. This alternative fills the entire central wetland and raises the grades of the site up such that the emergency department entrance and the building expansion entrance are at the same elevation as the entrance of the Phase 1 hospital. This feature is an important design element to the hospital because it reduces patient and visitor navigation issues inside the building. This alternative meets the current standards for hospital design with appropriate adjacencies and colocation of key services; allows physician and staff efficiency because it has inpatient and outpatient services at one facility; it provides parking for both patients and staff adjacent to the hospital; and, provides enough floor space to meet current program objectives. It is the connectedness of the existing and proposed facility and the future expansion potential that makes this alternative the preferred alternative and the applicant stated that this is the only practicable alternative of meeting the project purpose of a state-of-the-art facility.

B. Minimal Alteration. The amount of freshwater wetland to be altered must be kept to the minimum amount necessary for meeting the overall purpose of the project. The applicant examined alternative site layouts for the project and the only site layout that met the overall purpose of the project proposes to fill 3.49 acres of wetland. Other alternative site layouts that had less direct impact to the wetland were reviewed, but they did not meet the project purpose and need and the wetland alterations, although smaller, would most likely compromise the higher functions and values of the wetland. Given the chosen alternative described in Finding 13 A, the amount of alteration cannot be further minimized.

C. Compensation. Compensation is required to achieve the goal of no net loss of wetland functions and values because the project alters greater than 15,000 square feet of freshwater wetland, which is the threshold over which compensation is generally required. The applicant conducted a wetland mitigation site search and concluded that on-site mitigation was not possible due to space constraints. Although off-site parcels represented viable options for wetland compensation, none of the parcels meet the objectives of compensating for the lost wetland acreage and functions and values within the watershed. The applicant proposes to mitigate for the lost wetland functions and values by making a payment to the In-Lieu Fee (ILF) program of the Maine Natural Resource Conservation Fund (MNRCF).

The wetland that is proposed to be filled was originally formed as a gravel extraction area that was excavated below the groundwater table. This wetland was used as a wetland preservation area to partially compensate for the 0.91 acre of wetland losses approved in Department Order #L-20775-19-A-N/L-20775-TG-B-N. As part of the wetland compensation package for that permit and to enhance the wildlife habitat at the site, the pond and surrounding wetland was enhanced by the removal of solid wastes (such as trash, white goods, tires, metal, etc.), the water quality of the pond was protected by designing the stormwater management system such that only limited amounts of stormwater were directed to the wetland, and a narrow buffer around the wetland was maintained. The remaining wetland compensation for the 0.91 acre of impact from the initial project was 0.21 acre wetland creation in swales on the west side of the Fore River Parkway. The 0.21 acre of wetlands created as compensation for the initial project will not be affected by the proposed project.

The wetland proposed to be impacted is classified as a palustrine (freshwater) system with the following cover type classes: emergent (PEM1), open water (PUB3/4), forested (PFO1), and shrub wetland (PSS1). The pond is fed by a groundwater discharge that appears to flow year-round; therefore, groundwater recharge/discharge is considered a principle function of the wetland. Small fish have been observed in the pond in the past; this population is likely the remnant from birds or the previous hydrological connections to the Fore River and is supported by the groundwater flows; hence, fish and shellfish habitat is a principle function of the wetland. Sediment/toxicant retention is expected to be one of the principle functions of the wetland because any toxicants and sediments flowing into the wetland from the surrounding uplands would become trapped in the organic rich substrate observed in many areas around the pond. Nutrient removal/retention/transformation is expected to be another principle function of the wetland based on the observation of the density and type of vegetation thriving in the wetland and the presence of organic deposits in the wetland. Floodflow alteration is not a principle function of the wetland. Production export is not considered a principal function either. The wetland does provide food for wildlife. The wetland provides habitat for small fish, invertebrates and amphibian populations, which provides a forage base for secondary and tertiary consumers. Reptiles (turtles) have been observed basking

around the pond. Piscivorous birds, including herons, were observed foraging in and along the pond habitat. Migratory waterfowl, including mallard ducks and black ducks, were observed using the wetland. Although the wetland provides food for the wildlife utilizing the wetland, it does not provide nutrients that are transported out of the wetland. Wildlife habitat is considered to be a principle function of the wetland because of the variety of resident and migratory species present. As noted above, the pond has populations of invertebrates, fish and amphibians that provide a forage base for higher trophic level consumers. The wetlands and adjacent forested upland also support small mammals such as voles, shrews, field mice, and potentially larger mammals such as fox and woodchucks. Uniqueness/heritage value is believed to be present because the central wetland is somewhat unique as the surrounding land is developed and freshwater wetlands are rare on the Portland peninsula.

The wetland compensation required in Department Order #L-20775-19-A-N/L-20775-TG-B-N for 0.70 acre of wetland impacts will be eliminated by the proposed project, plus an additional 3.49 acres of wetland impact requires compensation, therefore the total amount of wetland impact requiring compensation for the project is 4.19 acres. The applicant proposes to make a contribution into the ILF program of the MNRCF in the amount of $834,156.00. Prior to the start of construction, a cashier's check or bank draft, payable to "Treasurer, State of Maine", with the permit number noted on the check, must be mailed to: ME DEP, Attn: ILF Program Administrator, State House Station 17, Augusta, ME 04333.

The Department finds that the applicant has avoided and minimized wetland impacts to the greatest extent practicable, and that the proposed project represents the least environmentally damaging alternative that meets the overall purpose of the project provided that prior to project construction, the applicant submits the ILF payment as described above.

14. AIR QUALITY:

The applicant has obtained an air emissions license from the Bureau of Air Quality, #A-912-71-A-N, for Phase I of the project. The applicant must amend its air emissions license from the Bureau of Air Quality prior to using any new equipment that requires an air emissions license.

15. ALL OTHER:

All other Findings of Fact, Conclusions and Conditions remain as approved in Department Order #L-20775-19-A-N and #L-20775-TG-B-N, and subsequent orders.

BASED on the above findings of fact, and subject to the conditions listed below, the Department makes the following conclusions pursuant to 38 M.R.S.A. Sections 480-A et seq. and Section 401 of the Federal Water Pollution Control Act:

A. The proposed activity will not unreasonably interfere with existing scenic, aesthetic, recreational, or navigational uses.

B. The proposed activity will not cause unreasonable erosion of soil or sediment.

C. The proposed activity will not unreasonably inhibit the natural transfer of soil from the terrestrial to the marine or freshwater environment.

D. The proposed activity will not unreasonably harm any significant wildlife habitat, freshwater wetland plant habitat, threatened or endangered plant habitat, aquatic habitat, travel corridor, freshwater, estuarine, or marine fisheries or other aquatic life provided that the applicant makes a contribution to the In-Lieu Fee (ILF) program, the wildlife habitat losses are noted on the In Lieu Fee (ILF) Project Data Worksheet as described in Findings 6 and 13, and the Turtle Trapping and Removal plan is implemented prior to construction as described in Finding 6.

E. The proposed activity will not unreasonably interfere with the natural flow of any surface or subsurface waters.

F. The proposed activity will not violate any state water quality law including those governing the classifications of the State's waters.

G. The proposed activity will not unreasonably cause or increase the flooding of the alteration area or adjacent properties.

H. The proposed activity is not on or adjacent to a sand dune.

I. The proposed activity is not on an outstanding river segment as noted in 38 M.R.S.A. Section 480-P.

BASED on the above findings of fact, and subject to the conditions listed below, the Department makes the following conclusions pursuant to 38 M.R.S.A. Sections 481 et seq.:

A. The applicant has provided adequate evidence of financial capacity and technical ability to develop the project in a manner consistent with state environmental standards provided that the applicant submits evidence of financial capacity to the BLWQ for review and approval prior to the start of construction as described in Finding 2.

B. The applicant has made adequate provision for fitting the development harmoniously into the existing natural environment and the development will not adversely affect existing uses, scenic character, air quality, water quality or other natural resources in the municipality or in neighboring municipalities.

C. The proposed development will be built on soil types which are suitable to the nature of the undertaking and will not cause unreasonable erosion of soil or sediment nor inhibit the natural transfer of soil.

D. The proposed development meets the standards for storm water management in Section 420-D and the standard for erosion and sedimentation control in Section 420-C provided that the applicant retains the design engineer, or another qualified engineer, to oversee the construction of the stormwater management structures; submits a log of inspection reports to the BLWQ for review; submits a copy of an executed long-term maintenance contract for the on-going maintenance of the Filterra®, the underdrained subsurface sand filter, and the StormFilter®; and, disposes of materials removed from the stormwater management systems in compliance with the Maine Solid Waste Management Rules as described in Finding 8.

E. The proposed development will not pose an unreasonable risk that a discharge to a significant groundwater aquifer will occur.

F. The applicant has made adequate provision of utilities, including water supplies, sewerage facilities and solid waste disposal required for the development and the development will not have an unreasonable adverse effect on the existing or proposed utilities in the municipality or area served by those services.

G. The activity will not unreasonably cause or increase the flooding of the alteration area or adjacent properties nor create an unreasonable flood hazard to any structure.

THEREFORE, the Department APPROVES the application of MERCY HOSPITAL to construct Phase II of the Mercy Hospital Relocation project as described above, SUBJECT TO THE FOLLOWING CONDITIONS and all applicable standards and regulations:

1. The Standard Conditions of Approval, a copy attached.

2. In addition to any specific erosion control measures described in this or previous orders, the applicant shall take all necessary actions to ensure that its activities or those of its agents do not result in noticeable erosion of soils or fugitive dust emissions on the site during the construction and operation of the project covered by this approval.

3. Severability. The invalidity or unenforceability of any provision, or part thereof, of this License shall not affect the remainder of the provision or any other provisions. This

License shall be construed and enforced in all respects as if such invalid or unenforceable provision or part thereof had been omitted.

4. The applicant or other responsible party shall, within three months of the expiration of each five-year interval from the date of this Order, submit a report certifying that the items listed in Department Rules, Chapter 500, Appendix B(4) have been completed in accordance with the approved plans.

5. Prior to the start of construction, the applicant must submit evidence that it has been granted a line of credit or a loan by a financial institution authorized to do business in this State or evidence of any other form of financial assurance determined by Department Rules, Chapter 373(1), to be adequate to the BLWQ for review and approval.

6. Prior to occupancy of the new buildings, the applicant shall submit a copy of an executed long-term maintenance contract (minimum of 5 years and renewable) to the BLWQ for the on-going maintenance of the Filterra®, the underdrained subsurface sand filter, and the StormFilter®.

7. Storm sewer grit and sediment materials removed from any parts of the stormwater management system, including conveyance structures, during maintenance activities shall be disposed of in compliance with the Maine Solid Waste Management Rules.

8. The applicant shall retain the design engineer, or another qualified engineer, to oversee the construction of the stormwater management structures according to the details and notes specified on the approved plans. Within thirty days of completion of each stormwater management structure, the applicant shall submit a log of inspection reports detailing the items inspected, photos taken, and the dates of each inspection to the BLWQ for review.

9. Prior to the start of construction, the applicant shall mail or deliver a cashier's check or bank draft in the amount of $834,156.00, payable to "Treasurer, State of Maine", with the permit number noted on the check; to: ME DEP, Attn: ILF Program Administrator, State House Station 17, Augusta, ME 04333.

10. Prior to the start of construction, the applicant shall implement the Turtle Trapping and Removal plan.

11. All other Findings of Fact, Conclusions and Conditions remain as approved in Department Order #L-20775-19-A-N and #L-20775-TG-B-N, and subsequent orders, and are incorporated herein.

THIS APPROVAL DOES NOT CONSTITUTE OR SUBSTITUTE FOR ANY OTHER REQUIRED STATE, FEDERAL OR LOCAL APPROVALS NOR DOES IT VERIFY COMPLIANCE WITH ANY APPLICABLE SHORELAND ZONING ORDINANCES.

DONE AND DATED IN AUGUSTA, MAINE, THIS 22 DAY OF March, 2013.

DEPARTMENT OF ENVIRONMENTAL PROTECTION

PLEASE NOTE THE ATTACHED SHEET FOR GUIDANCE ON APPEAL PROCEDURES...

CGW/L20775TA&UN/ATS#74936&74937

Department of Environmental Protection

SITE LOCATION OF DEVELOPMENT (SITE)
STANDARD CONDITIONS

A. **Approval of Variations from Plans.** The granting of this approval is dependent upon and limited to the proposals and plans contained in the application and supporting documents submitted and affirmed to by the applicant. Any variation from these plans, proposals, and supporting documents is subject to review and approval prior to implementation. Further subdivision of proposed lots by the applicant or future owners is specifically prohibited without prior approval of the Board, and the applicant shall include deed restrictions to that effect.

B. **Compliance with All Applicable Laws.** The applicant shall secure and comply with all applicable federal, state, and local licenses, permits, authorizations, conditions, agreements, and orders prior to or during construction and operation, as appropriate.

C. **Compliance with All Terms and Conditions of Approval.** The applicant shall submit all reports and information requested by the Board or the Department demonstrating that the applicant has complied or will comply with all preconstruction terms and conditions of this approval. All preconstruction terms and conditions must be met before construction begins.

D. **Advertising.** Advertising relating to matters included in this application shall refer to this approval only if it notes that the approval has been granted WITH CONDITIONS, and indicates where copies of those conditions may be obtained.

E. **Transfer of Development.** Unless otherwise provided in this approval, the applicant shall not sell, lease, assign or otherwise transfer the development or any portion thereof without prior written approval of the Board where the purpose or consequence of the transfer is to transfer any of the obligations of the developer as incorporated in this approval. Such approval shall be granted only if the applicant or transferee demonstrates to the Board that the transferee has the technical capacity and financial ability to comply with conditions of this approval and the proposals and plans contained in the application and supporting documents submitted by the applicant.

F. **Time frame for approvals.** If the construction or operation of the activity is not begun within four years, this approval shall lapse and the applicant shall reapply to the Board for a new approval. The applicant may not begin construction or operation of the development until a new approval is granted. A reapplication for approval may include information submitted in the initial application by reference. This approval, if construction is begun within the four-year time frame, is valid for seven years. If construction is not completed within the seven-year time frame, the applicant must reapply for, and receive, approval prior to continuing construction.

G. **Approval Included in Contract Bids.** A copy of this approval must be included in or attached to all contract bid specifications for the development.

H. **Approval Shown to Contractors.** Work done by a contractor pursuant to this approval shall not begin before the contractor has been shown by the developer a copy of this approval.

Natural Resource Protection Act (NRPA)
Standard Conditions

THE FOLLOWING STANDARD CONDITIONS SHALL APPLY TO ALL PERMITS GRANTED UNDER THE NATURAL RESOURCE PROTECTION ACT, TITLE 38, M.R.S.A. SECTION 480-A ET.SEQ. UNLESS OTHERWISE SPECIFICALLY STATED IN THE PERMIT.

A. Approval of Variations From Plans. The granting of this permit is dependent upon and limited to the proposals and plans contained in the application and supporting documents submitted and affirmed to by the applicant. Any variation from these plans, proposals, and supporting documents is subject to review and approval prior to implementation.

B. Compliance With All Applicable Laws. The applicant shall secure and comply with all applicable federal, state, and local licenses, permits, authorizations, conditions, agreements, and orders prior to or during construction and operation, as appropriate.

C. Erosion Control. The applicant shall take all necessary measures to ensure that his activities or those of his agents do not result in measurable erosion of soils on the site during the construction and operation of the project covered by this Approval.

D. Compliance With Conditions. Should the project be found, at any time, not to be in compliance with any of the Conditions of this Approval, or should the applicant construct or operate this development in any way other the specified in the Application or Supporting Documents, as modified by the Conditions of this Approval, then the terms of this Approval shall be considered to have been violated.

E. Time frame for approvals. If construction or operation of the activity is not begun within four years, this permit shall lapse and the applicant shall reapply to the Board for a new permit. The applicant may not begin construction or operation of the activity until a new permit is granted. Reapplications for permits may include information submitted in the initial application by reference. This approval, if construction is begun within the four-year time frame, is valid for seven years. If construction is not completed within the seven-year time frame, the applicant must reapply for, and receive, approval prior to continuing construction.

F. No Construction Equipment Below High Water. No construction equipment used in the undertaking of an approved activity is allowed below the mean high water line unless otherwise specified by this permit.

G. Permit Included In Contract Bids. A copy of this permit must be included in or attached to all contract bid specifications for the approved activity.

H. Permit Shown To Contractor. Work done by a contractor pursuant to this permit shall not begin before the contractor has been shown by the applicant a copy of this permit.

STORMWATER STANDARD CONDITIONS

STRICT CONFORMANCE WITH THE STANDARD AND SPECIAL CONDITIONS OF THIS APPROVAL IS NECESSARY FOR THE PROJECT TO MEET THE STATUTORY CRITERIA FOR APPROVAL

Standard conditions of approval. Unless otherwise specifically stated in the approval, a department approval is subject to the following standard conditions pursuant to Chapter 500 Stormwater Management Law.

(1) Approval of variations from plans. The granting of this approval is dependent upon and limited to the proposals and plans contained in the application and supporting documents submitted and affirmed to by the applicant. Any variation from these plans, proposals, and supporting documents must be reviewed and approved by the department prior to implementation. Any variation undertaken without approval of the department is in violation of 38 M.R.S.A. §420-D(8) and is subject to penalties under 38 M.R.S.A. §349.

(2) Compliance with all terms and conditions of approval. The applicant shall submit all reports and information requested by the department demonstrating that the applicant has complied or will comply with all terms and conditions of this approval. All preconstruction terms and conditions must be met before construction begins.

(3) Advertising. Advertising relating to matters included in this application may not refer to this approval unless it notes that the approval has been granted WITH CONDITIONS, and indicates where copies of those conditions may be obtained.

(4) Transfer of project. Unless otherwise provided in this approval, the applicant may not sell, lease, assign, or otherwise transfer the project or any portion thereof without written approval by the department where the purpose or consequence of the transfer is to transfer any of the obligations of the developer as incorporated in this approval. Such approval may only be granted if the applicant or transferee demonstrates to the department that the transferee agrees to comply with conditions of this approval and the proposals and plans contained in the application and supporting documents submitted by the applicant. Approval of a transfer of the permit must be applied for no later than two weeks after any transfer of property subject to the license.

(5) Time frame for approvals. If the construction or operation of the activity is not begun within four years, this approval shall lapse and the applicant shall reapply to the department for a new approval. The applicant may not begin construction or operation of the project until a new approval is granted. A reapplication for approval may include information submitted in the initial application by reference. This approval, if construction is begun within the four-year time frame, is valid for seven years. If construction is not completed within the seven-year time frame, the applicant must reapply for, and receive, approval prior to continuing construction.

(6) Certification. Contracts must specify that "all work is to comply with the conditions of the Stormwater Permit." Work done by a contractor or subcontractor pursuant to this approval may not begin before the contractor and any subcontractors have been shown a copy of this

approval with the conditions by the developer, and the owner and each contractor and subcontractor has certified, on a form provided by the department, that the approval and conditions have been received and read, and that the work will be carried out in accordance with the approval and conditions. Completed certification forms must be forwarded to the department.

(7) Maintenance. The components of the stormwater management system must be adequately maintained to ensure that the system operates as designed, and as approved by the department.

(8) Recertification requirement. Within three months of the expiration of each five-year interval from the date of issuance of the permit, the permittee shall certify the following to the department.

(a) All areas of the project site have been inspected for areas of erosion, and appropriate steps have been taken to permanently stabilize these areas.

(b) All aspects of the stormwater control system have been inspected for damage, wear, and malfunction, and appropriate steps have been taken to repair or replace the facilities.

(c) The erosion and stormwater maintenance plan for the site is being implemented as written, or modifications to the plan have been submitted to and approved by the department, and the maintenance log is being maintained.

(9) Severability. The invalidity or unenforceability of any provision, or part thereof, of this permit shall not affect the remainder of the provision or any other provisions. This permit shall be construed and enforced in all respects as if such invalid or unenforceable provision or part thereof had been omitted.

November 16, 2005 (revised December 27, 2011)

DEP INFORMATION SHEET
Appealing a Department Licensing Decision

Dated: March 2012 **Contact: (207) 287-2811**

SUMMARY

There are two methods available to an aggrieved person seeking to appeal a licensing decision made by the Department of Environmental Protection's ("DEP") Commissioner: (1) in an administrative process before the Board of Environmental Protection ("Board"); or (2) in a judicial process before Maine's Superior Court. An aggrieved person seeking review of a licensing decision over which the Board had original jurisdiction may seek judicial review in Maine's Superior Court.

A judicial appeal of final action by the Commissioner or the Board regarding an application for an expedited wind energy development (35-A M.R.S.A. § 3451(4)) or a general permit for an offshore wind energy demonstration project (38 M.R.S.A. § 480-HH(1)) or a general permit for a tidal energy demonstration project (38 M.R.S.A. § 636-A) must be taken to the Supreme Judicial Court sitting as the Law Court.

This INFORMATION SHEET, in conjunction with a review of the statutory and regulatory provisions referred to herein, can help a person to understand his or her rights and obligations in filing an administrative or judicial appeal.

I. ADMINISTRATIVE APPEALS TO THE BOARD

LEGAL REFERENCES

The laws concerning the DEP's *Organization and Powers*, 38 M.R.S.A. §§ 341-D(4) & 346, the *Maine Administrative Procedure Act*, 5 M.R.S.A. § 11001, and the DEP's *Rules Concerning the Processing of Applications and Other Administrative Matters* ("Chapter 2"), 06-096 CMR 2 (April 1, 2003).

HOW LONG YOU HAVE TO SUBMIT AN APPEAL TO THE BOARD

The Board must receive a written appeal within 30 days of the date on which the Commissioner's decision was filed with the Board. Appeals filed after 30 calendar days of the date on which the Commissioner's decision was filed with the Board will be rejected.

HOW TO SUBMIT AN APPEAL TO THE BOARD

Signed original appeal documents must be sent to: Chair, Board of Environmental Protection, c/o Department of Environmental Protection, 17 State House Station, Augusta, ME 04333-0017; faxes are acceptable for purposes of meeting the deadline when followed by the Board's receipt of mailed original documents within five (5) working days. Receipt on a particular day must be by 5:00 PM at DEP's offices in Augusta; materials received after 5:00 PM are not considered received until the following day. The person appealing a licensing decision must also send the DEP's Commissioner a copy of the appeal documents and if the person appealing is not the applicant in the license proceeding at issue the applicant must also be sent a copy of the appeal documents. All of the information listed in the next section must be submitted at the time the appeal is filed. Only the extraordinary circumstances described at the end of that section will justify evidence not in the DEP's record at the time of decision being added to the record for consideration by the Board as part of an appeal.

WHAT YOUR APPEAL PAPERWORK MUST CONTAIN

Appeal materials must contain the following information at the time submitted:

1. *Aggrieved Status.* The appeal must explain how the person filing the appeal has standing to maintain an appeal. This requires an explanation of how the person filing the appeal may suffer a particularized injury as a result of the Commissioner's decision.
2. *The findings, conclusions or conditions objected to or believed to be in error.* Specific references and facts regarding the appellant's issues with the decision must be provided in the notice of appeal.
3. *The basis of the objections or challenge.* If possible, specific regulations, statutes or other facts should be referenced. This may include citing omissions of relevant requirements, and errors believed to have been made in interpretations, conclusions, and relevant requirements.
4. *The remedy sought.* This can range from reversal of the Commissioner's decision on the license or permit to changes in specific permit conditions.
5. *All the matters to be contested.* The Board will limit its consideration to those arguments specifically raised in the written notice of appeal.
6. *Request for hearing.* The Board will hear presentations on appeals at its regularly scheduled meetings, unless a public hearing on the appeal is requested and granted. A request for public hearing on an appeal must be filed as part of the notice of appeal.
7. *New or additional evidence to be offered.* The Board may allow new or additional evidence, referred to as supplemental evidence, to be considered by the Board in an appeal only when the evidence is relevant and material and that the person seeking to add information to the record can show due diligence in bringing the evidence to the DEP's attention at the earliest possible time in the licensing process or that the evidence itself is newly discovered and could not have been presented earlier in the process. Specific requirements for additional evidence are found in Chapter 2.

OTHER CONSIDERATIONS IN APPEALING A DECISION TO THE BOARD

1. *Be familiar with all relevant material in the DEP record.* A license application file is public information, subject to any applicable statutory exceptions, made easily accessible by DEP. Upon request, the DEP will make the material available during normal working hours, provide space to review the file, and provide opportunity for photocopying materials. There is a charge for copies or copying services.
2. *Be familiar with the regulations and laws under which the application was processed, and the procedural rules governing your appeal.* DEP staff will provide this information on request and answer questions regarding applicable requirements.
3. *The filing of an appeal does not operate as a stay to any decision.* If a license has been granted and it has been appealed the license normally remains in effect pending the processing of the appeal. A license holder may proceed with a project pending the outcome of an appeal but the license holder runs the risk of the decision being reversed or modified as a result of the appeal.

WHAT TO EXPECT ONCE YOU FILE A TIMELY APPEAL WITH THE BOARD

The Board will formally acknowledge receipt of an appeal, including the name of the DEP project manager assigned to the specific appeal. The notice of appeal, any materials accepted by the Board Chair as supplementary evidence, and any materials submitted in response to the appeal will be sent to Board members with a recommendation from DEP staff. Persons filing appeals and interested persons are notified in advance of the date set for Board consideration of an appeal or request for public hearing. With or without holding a public hearing, the Board may affirm, amend, or reverse a Commissioner decision or remand the matter to the Commissioner for further proceedings. The Board will notify the appellant, a license holder, and interested persons of its decision.

II. JUDICIAL APPEALS

Maine law generally allows aggrieved persons to appeal final Commissioner or Board licensing decisions to Maine's Superior Court, see 38 M.R.S.A. § 346(1); 06-096 CMR 2; 5 M.R.S.A. § 11001; & M.R. Civ. P 80C. A party's appeal must be filed with the Superior Court within 30 days of receipt of notice of the Board's or the Commissioner's decision. For any other person, an appeal must be filed within 40 days of the date the decision was rendered. Failure to file a timely appeal will result in the Board's or the Commissioner's decision becoming final.

An appeal to court of a license decision regarding an expedited wind energy development, a general permit for an offshore wind energy demonstration project, or a general permit for a tidal energy demonstration project may only be taken directly to the Maine Supreme Judicial Court. See 38 M.R.S.A. § 346(4).

Maine's Administrative Procedure Act, DEP statutes governing a particular matter, and the Maine Rules of Civil Procedure must be consulted for the substantive and procedural details applicable to judicial appeals.

ADDITIONAL INFORMATION

If you have questions or need additional information on the appeal process, for administrative appeals contact the Board's Executive Analyst at (207) 287-2452 or for judicial appeals contact the court clerk's office in which your appeal will be filed.

Note: The DEP provides this INFORMATION SHEET for general guidance only; it is not intended for use as a legal reference. Maine law governs an appellant's rights.

GENERAL APPLICATION DOCUMENT

WAIVER REQUESTS

The Accompanying Waiver Table provides a description of the applicable waiver requests and supporting evidence for these requests.

Standard to be Waived: Cite Ordinance or Technical Manual Standard	**Cite Standard Language:** Cite specific language of applicable Ordinance or Technical Manual Standard	**Waiver Being Sought:** Describe waiver being sought. Ex. – We are requesting a two-way parking lot drive aisle width of 20'.	**Justification for Waiver:** Address specific waiver criteria, if applicable, and document reasons for the waiver request.
Technical Standards – Section 5. Portland Stormwater Management Standards and MaineDEP Chapter 500 Stormwater Management	*Flooding Standards: : Subcatchment plans with flow paths, full hydrology computations/model output of pre- and post-development conditions, summary of pre- and post-development flowrates, and a written request for waiver with rationale for waiver as noted in Section 5.II.F. (as applicable)*	The applicant is requesting a waiver for the flooding standard requirements.	The project will discharge stormwater runoff to existing drainage systems that will discharge directly to the Fore River which is a tidal waterbody. Mercy has previously requested and been granted, a waiver of the flooding standards under both the State and Local stormwater rules.
Technical Standards – Transportation Standards – Sidewalks (14-526 (a) 2 c)	*(i) All proposed developments shall provide sidewalks along all frontages in accordance with Sections 14-498 and 14- 499 of the City Code, installed to City specifications as described in Section 1 of the Technical Manual. An applicant may request a waiver from curb and sidewalk installation requirements if they meet applicable waiver criteria listed in Section 14-506 (b) of the City Code.*	The applicant is requesting a waiver to provide curb and sidewalk from the southerly driveway to the north end of the property, as there is no curb in the area today and no drainage systems.	There is no sidewalk in existence or expected within 1000 feet and the construction of sidewalks does not contribute to the development of a pedestrian oriented infrastructure.
Technical Standards – Transportation Standards –Bicycle Parking (14-526 (a) 4 b)	*(b) Non-residential structures. Two (2) bicycle parking spaces for every ten (10) vehicle parking spaces for the first one hundred (100) required vehicle parking spaces, plus one (1) bicycle parking space for every twenty (20) required motor vehicle parking space over one hundred (100) required vehicle parking spaces.*	The applicant is requesting a waiver of the required number of bicycle parking spaces as that would exceed well over 50 bike spaces which is considered excessive for the Hospital use.	The proposed development is expected to generate a reduced demand for bicycle parking due to the service they provide.

GENERAL APPLICATION DOCUMENT

ZONING ASSESSMENT

See attached Zoning Assessment Table and project site plans for additional information.

ZONING ANALYSIS Relevant Zone(s) C-26 Mercy Hospital Contract Zone

All Projects:

Parking and Driveway Mitigation Evaluations
Mercy Hospital Phase II Expansion – Portland, Maine
JN 3257.04

Date: September 10, 2019
Subject: Parking and Driveway Mitigation Evaluations
Mercy Hospital Phase II Expansion
To: Nick Munro, Northern Light Health
From: Randy Dunton, Gorrill Palmer

Gorrill Palmer (GP) has been retained by Northern Light Health to provide a preliminary evaluation of potential parking deficit and driveway intersection mitigation as a result of the Phase II expansion of Mercy Hospital on Fore River Parkway in Portland, Maine. The proposed expansion includes the following:

- 32 new beds (Total of 71 beds for Phase I + II)
- 54,889 sf of new hospital (Total of 192,988 sf for Phase I + II)
- 34,987 sf ambulatory surgery center (ASC) (Total of 117,173 sf MOB for Phase I + II)

It is assumed that the ASC is medical office building space with outpatient service only.

PARKING EVALUATION

On-Site Parking Inventory

GP previously completed weekday on-site parking occupancy counts on Wednesday, January 10, 2017 from 10:30 AM to 11:30 AM and again on January 25, 2017 from 10:00 AM to 2:00 PM. Wednesday was chosen after discussions with the hospital and this was identified as their busiest day. Based on information provided in *ITE Parking Generation, 4th Edition*, 11 AM and 12 PM were identified as peak parking demand times for a hospital. The following table summarizes the parking demands that occurred on Wednesday, January 10, 2017. The attached site plan identified the individual lots counted.

January 10, 2017 Parking Inventory and Demand

Lot	Total Number of Spaces Available	Number of Parked Vehicles		
		10:30 AM	11:00 AM	11:30 AM
1	34	24	27	24
2	50	47	44	44
3	101	50	53	54
4	162	112	102	107
5	105	62	65	59
6	310	174	174	178
Total	**762**	**469**	**465**	**466**

The following table summarizes the parking demands that occurred on Wednesday, January 25, 2017. Please note that the parking times were expanded from the previous parking inventory to capture a broader time period.

January 25, 2017 Parking Inventory and Demand

Lot	Total Number of Spaces Available	Number of Parked Vehicles				
		10:00 AM	11:00 AM	12:00 PM	1:00 PM	2:00 PM
1	34	20	23	17	14	20
2	50	44	46	42	40	41
3	101	56	57	56	55	55
4	162	115	116	107	117	146
5	105	62	64	64	65	65
6	310	181	184	205	208	187
Total	**762**	**478**	**490**	**491**	**499**	**514**

As can be seen from the above two tables, the highest parking demand in the times recorded (514 at 2:00 PM on January 25, 2017) was approximately 67 percent of the total. Please note that the parking demand trend is increasing from 10 AM to 2 PM, which indicates that later in the day after the 2 PM time period, the demand could be slightly higher. However, comparing this with other studies and the previous count, we suspect the parking demand was close to its peak. To be conservative, we added 11 parked cars to the 514 for a total of 525 vehicle peak parking demand.

It should be noted that this count is conservative, since parking for the State Street location was being provided on this campus at the time of the counts, and therefore the parking demand rate will be higher than it normally would.

Parking Demand

- Based on City Ordinance Requirements:

Using the City ordinance requirement of 1 space per 500 sf of floor area for the hospital, the existing hospital (approximately 138,099 sf) would require 276 parking spaces.

Using the City ordinance requirement of 1 space per 400 sf of floor area, the existing medical office building (MOB, approximately 82,186 sf) would require 205 parking spaces.

The total number of existing parking spaces required based on the City ordinance is 481 (276 hospital + 205 MOB = 481). Since the site currently has 762 parking spaces, it exceeds the City ordinance by approximately 281 parking spaces.

- Based on Current Parking Demand Rate:

Since the hospital and MOB share parking fields, it would be difficult to identify the destination of the driver of each of the parked cars. For the purposes of this evaluation, we assumed a conservative approach that of the parked cars, 85% of the 205 spaces identified by the City ordinance requirement (or approximately 174 spaces) are associated with the MOB. This would leave approximately 351 of the 525 peak parking demand associated with the demand for the hospital.

The existing hospital is 138,099 sf (not including MOB). Based on this size and the peak parking demand of 351 parked vehicles, the current parking demand for the Hospital is approximately 1.27 spaces per 500 sf of hospital, which is close to the City ordinance (1 per 500 sf). As noted previously, the rate was expected to be slightly higher due to State Street vehicles parking on this campus.

The existing MOB is 82,186 sf. Based on this size and the peak parking demand of 174 parked vehicles, the current parking demand for MOB is approximately 0.85 spaces per 400 sf of MOB, which is close to the City ordinance (1 per 400 sf).

- Parking Demand for the Hospital Expansion:

Based on the City ordinance (1 per 500 sf), the additional parking required for the 54,889 sf hospital expansion is 110 parking spaces. Using the estimated existing rate identified by the counts (1.27 per 500 sf), the increased parking demand would be 140 parking spaces.

- Parking Demand for the MOB Expansion:

Based on the City ordinance (1 per 400 sf), the additional parking required for the 34,987 sf MOB expansion is 88 parking spaces. Using the estimated existing rate identified by the counts (0.85 per 400 sf), the increased parking demand would be 75 parking spaces.

- Recommended Site Parking Supply After Hospital Expansion:

The forecast parking demand of 198 spaces using the ordinance or 215 parking spaces using the calculated rate, plus the existing parking demand of 525 parking spaces is approximately 723 to 740 parking spaces. When determining parking demands, the standard is to provide "practical capacity", which is approximately 15% additional parking than the forecast demand. This "practical capacity" provides enough additional parking spaces so the last few drivers do not have to drive around the entire parking area in order to find a parking space. Applying this "practical capacity" adjustment increases the recommended parking demand to approximately 831 to 851 parking spaces. Upon completion of Phase 11, the total on-site parking supply will be 857 parking spaces, a surplus of approximately 6 to 26 parking spaces more than what is needed.

Parking Layout

As part of the hospital expansion, some parking will be displaced. The proposed hospital expansion will displace approximately 105 parking spaces (staff only). In addition, 19 parking spaces will be needed for the emergency department (ED). The site plan submitted under separate cover shows the 105 relocated parking spaces and the 19 ED spaces.

As previously identified, ample parking will be provided on-site.

DRIVEWAY MITIGATION EVALUATION

In addition to evaluating the parking demand, GP also evaluated the potential for additional mitigation at the site driveways to accommodate the additional traffic generated by the proposed hospital expansion. The following is a summary of the findings:

Collision Data

GP obtained the crash data for the area surrounding the site from the MaineDOT for the period of 2016-2018, the most recent three-year period available. In order to evaluate whether a location has a crash problem, MaineDOT uses two criteria to define a High Crash Location (HCL). Both criteria must be met in order to be classified as an HCL.

1. A critical rate factor (CRF) of 1.00 or more for a three year period. A CRF compares the actual crash rate to the rate for similar intersections in the state. A CRF of less than 1.00 indicates a rate of less than average, **and**:

2. A minimum of eight crashes over the same three-year period.

Based on the crash data report generated by MaineDOT, there are no HCLs in the vicinity of the site. Although there are no HCLs in the vicinity of the site, the intersection of Fore River Parkway with Veterans Bridge meets one of the two criteria with 12 crashes and a CRF of 0.37 during the most recent three year period.

It is also important to note that there were no crashes involving pedestrians or bicyclists in the most recent three year period.

Existing Traffic Volumes

GP completed turning movement counts on Wednesday, January 25, 2017 at the two site driveways on Fore River Parkway from 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. As identified in a previous section, Wednesdays were identified by the Hospital as being their busiest day. The results of the counts are shown on the attached Figure 2.

2022 Predevelopment Design Hour Volumes

The traffic volumes in Figure 2 were counted in late January. The Fore River Parkway traffic volumes are adjusted to the 30th highest hour of the year using MaineDOT weekly group mean factors. This adjustment increases the Fore River volumes to those that may be experienced during peak summer months. This seasonal adjustment resulted in an increase of 18%. The traffic volumes into and out of the site are not adjusted by a seasonal adjustment.

In addition to seasonally adjusting the Fore River Parkway traffic volumes, they are also increased by an annual growth to estimate traffic volumes for the build out year of the project. MaineDOT traffic counts in the area show an average increase in traffic volumes of approximately 1.5% per year, which was utilized to increase the Fore River Parkway counted volumes. The build out year for the hospital is anticipated to be 2022. The 2022 Adjusted Volumes on the attached Figure 3 reflect the seasonal and annual adjustments for the Fore River traffic volumes.

Approved projects that are not yet opened, as well as projects for which applications have been filed are required to be included in the predevelopment volumes on Fore River Parkway. This initial evaluation was started in 2017, and at that time GP included traffic from the full build-out of the Thompson's Point development. It should be noted that this project has standing since 2002. To be conservative GP increased the through traffic by 25% to accommodate for other development traffic and is shown on the attached Figure 4.

The 2022 Adjusted Volumes on the attached Figure 3 have been combined with the Other Development traffic volumes on Figure 4 to yield the 2022 Predevelopment shown on Figure 5.

Increase in Traffic due to Hospital Expansion

To calculate the trip generation for the proposed hospital expansion (54,889 SF & 32 new beds), GP utilized two separate sources. The first source was to use the same trip generation rates that were used in the previously approved 2001 Traffic Impact Study completed by DeLuca-Hoffman Associates, Inc. The second source was to use the ITE *Trip Generation*, 10th Edition, Land Use Code (LUC) 610 – Hospital to forecast trip generation for the proposed expansion. The trip generation has been based on the average of the trip generation for gross floor area (GFA) and number of beds. The number of employees was not used in the original 2001 study and to ensure we were comparing "apples to apples" the same methodology was used using the ITE source.

GP also used LUC 720 – Medical / Dental Office Building for the proposed ASC facility (34,987 SF).

Based on the MaineDOT Traffic Movement Permit (TMP) (Div. 06-00035-A-N) issued on 5-13-2002, the site is permitted for 784 AM and 687 PM peak hour trips during the adjacent street peak hours and 990 PM peak hour trips of the generator.

Trip Generation Summary

	AM Adjacent St			PM Adjacent St		
	In	Out	Total	In	Out	Total
Permitted for Site	598	186	784	222	465	687
Counted for Site	185	53	238	64	173	237
Proposed Hospital Expansion using 2001 Rates	59	19	78	21	38	59
Proposed Hospital Expansion using ITE 10th Edition	38	16	54	17	40	57
Proposed ASC Facility using ITE 10th Edition	78	19	97	36	85	121
Remaining Trip Credit using: 2001 Rates & (ITE 10 Edition)	276 (297)	95 (98)	371 (395)	101 (105)	169 (167)	270 (272)

(xx) = Remaining Trip Credit using ITE 10th Edition for all uses

As shown in the table, the site is well below the permitted trip generation with 371 AM and 270 PM peak hour trip end **credits** using the original trip rates from the 2001 Traffic Impact Study and 395 AM and 272 PM peak hour trip end **credits** using the most current edition of ITE. As identified previously, this also includes employees from the State Street location already parking on this site.

Since the existing plus proposed trip generation is forecast to be well below both the AM and PM permitted peak hour trips, it is our opinion that no modification is required to the previously issued TMP.

For the purposes of the remainder of the study, to be conservative the trip generation using the previous 2001 TIS was used since it is slightly higher than the trip generation using the ITE rates.

Trip Distribution and Assignment

GP has assumed that all trips are primary in nature, with the sole purpose of going to and from the site. The trip distribution and assignment has been based on the existing traffic patterns and is shown on the attached Figure 6.

2022 Postdevelopment Design Hour Volumes

The 2022 Predevelopment Design Hour Volumes (DHV) shown on Figure 5 have been combined with the traffic forecast for the development shown on Figure 6 to yield the 2022 Postdevelopment DHV shown on the attached Figure 7.

Capacity Analysis

GP completed capacity analyses for the site driveways using Synchro/SimTraffic computer analysis software with and without the hospital expansion. Level of service rankings are similar to the academic ranking system where an 'A' is very good with little control delay and an 'F' represents very congested traffic conditions. If the level of service falls below a 'D,' an evaluation should be made to determine if mitigation is warranted. The following tables summarize the relationship between control delay and level of service for signalized and unsignalized intersections.

Level of Service Criteria for Signalized Intersections

Level of Service	Control Delay per Vehicle (sec)
A	Less than 10.0
B	10.1 to 20.0
C	20.1 to 35.0
D	35.1 to 55.0
E	55.1 to 80.0
F	Greater than 80.0

Level of Service Criteria for Unsignalized Intersections

Level of Service	Control Delay per Vehicle (sec)
A	Less than 10.0
B	10.1 to 15.0
C	15.1 to 25.0
D	25.1 to 35.0
E	35.1 to 50.0
F	Greater than 50.0

The results of the capacity analysis are summarized as follows. The detailed analyses are attached.

Level of Service Summary

Approach	Level of Service			
	AM Pre	AM Post	PM Pre	PM Post
Fore River / North Driveway (unsignalized)				
Driveway WB	A	A	A	A
Fore River NB	A	A	A	A
Fore River SB	A	A	A	A
Fore River / South Driveway (signalized)				
Driveway WB	B	B	B	B
Fore River NB	A	A	A	A
Fore River SB	A	A	A	A
Overall	**A**	**A**	**A**	**A**

As shown in the table, the two site driveways are forecast to operate at high levels of service both before and after the campus expansion is completed. The expansion is not forecast to change the levels of service at either site driveway.

Queuing Analysis

GP completed queuing analyses for the site driveways using the same Synchro/SimTraffic used to complete the capacity analysis with and without the hospital expansion. The queue analysis involves comparing the 95th percentile queue length to the available storage length. The following table summarizes the storage lengths and the 95th percentile queue lengths for the two site driveways:

Queue Analysis Summary

Approach	Storage Length (ft)	95th Percentile Queue Length (ft)			
		AM Pre	AM Post	PM Pre	PM Post
Fore River / North Driveway (unsignalized)					
Driveway WB	NA	45	60	60	80
Fore River NB R	170	5	15	5	5
Fore River SB L	270	55	65	40	55
Fore River / South Driveway (signalized)					
Driveway WB L	NA	55	65	55	75
Driveway WB R	100	15	25	40	50
Fore River NB R	400	--	--	--	--
Fore River SB L	500	35	40	15	25

For the purposes of queue length evaluation, the length of one car and the associated space between cars is considered to be 25 feet. The 95th percentile queue lengths are forecast to increase by one vehicle or less from the predevelopment to the postdevelopment conditions. Additionally, the available storage lengths can accommodate the 95th percentile queue lengths after the expansion is completed. This analysis reflects timing changes from pre to post development conditions.

Lane Warrant Analysis

GP would typically complete a lane warrant analysis for Fore River Parkway at the site driveways to determine if left or right turn auxiliary lanes are warranted. However, Fore River Parkway at both site driveways has both left and right turn storage lanes at both site driveways, so no lane warrant analysis was required.

CONCLUSIONS / RECOMMENDATIONS

The following is a summary of the conclusions and recommendations based on the parking and driveway mitigation analyses:

1. The recommended on-site parking supply after the construction of the proposed campus expansion and including adjustment for "practical capacity" is 831 to 851 parking spaces. The expansion will supply 857 parking spaces, a surplus of 6 to 26 spaces more than what is needed.

2. The campus expansion and ASC facility is forecast to generate 175 trip ends during the AM peak hour of the adjacent street and 180 trip ends during the PM peak hour of the adjacent street. In reviewing the previously issued MaineDOT Traffic Movement Permit for this

project, the site is forecast to still be well below the permitted trip generations and therefore will not require any modifications to the permit.

3. The MaineDOT crash data indicates that there are no high crash locations in the vicinity of the site.

4. The intersections of Fore River Parkway with the site driveways are forecast to operate at acceptable levels of service with no additional mitigation required.

TRANSPORTATION DEMAND MANAGEMENT

The following statements are provided in accordance with the Section 1.13 of the Technical Manual pertaining to Transportation Demand Management (TDM);

TRANSPORTATION

1.13.1 Transportation Narrative –

Every TDM plan shall describe how the project fits within the multimodal transportation system serving the district in which the development is located. The narrative should address the specifics of the use, occupants, visitors, and location of the development and how it is anticipated to relate to its transportation context.

Mercy expects to operate the Fore River Campus in a manner that promotes transportation demand alternatives to the extent practicable, given the use and inherent conditions associated Acute care and Outpatient health services, staff work hours[1] and overall hospital campus visitation. A fundamental result of the relocation of Mercy programming from the State Street facility to the Fore River Campus will be decreased traffic resulting from Mercy State Street operations. This action alone will result in significant shifting of long standing Mercy traffic from the Portland Peninsula interior and specifically State and High Streets, to the Fore River Parkway and its direct connectivity to the regional highway system. The State Street neighborhood will dramatically benefit from decreased emergency services traffic and overall parking demand along neighborhood streets. Further, the Phase 2 development will not result in increased traffic pressure on the Peninsula as a whole, since Mercy has always been a valued existing land use that has generated traffic on the Peninsula. Simply, the move results in an improvement for Mercy generated traffic as it utilizes the direct highway connectivity and ample capacity of these highways and the Fore River Parkway. These circumstances likely provide greater overall benefit than what will be achieved through TDM, although TDM remains a valuable secondary source of transportation and trip generation management.

The Fore River campus also benefits from proximity to the METRO service and this will continue into the future, particularly with updated METRO routing and positioning of multiple stops along the Parkway expected in the future. The ability for both staff and patients to use METRO and public transportation associated with the nearby Transportation Terminal is unique to the Fore River Campus and Mercy will seek to take advantage of these transportation resources ever more greatly into the future.

In addition, Mercy continues to promote the shifting of various operational and administrative functions to their outpatient facilities in surrounding Portland

[1] Acute care hospital settings and workforce hours are characterized by shift work, per diem staff and irregular patient load, thus contributing to challenges of a traditional TDM plan.

Communities and/or work from home telecommuting opportunities, thus resulting in decreased traffic overall to the Portland Peninsula.

Ultimately Mercy's TDM will include strategies that encourage employees to use alternatives to driving to work unaccompanied. For example, employees participating in a ride share program currently benefit from designated spaces at the northwest parking lot, nearest the MOB and thus do not need to park in the south parking lot[2]. This will enable Mercy and other tenants to successfully provide parking to all employees, visitors, patients, and physicians in the designed parking plan. Mercy also maintains bike racks at the front of the hospital and near the staff entrance at the south end of the hospital building. Bicycle riding staff have the availability of staff locker room facilities for changing and showering. Mercy routinely provides Taxi vouchers to patients on an as needed basis and they have promoted bus pass programs in the past. An updated Transportation Demand Management Plan is currently underway and will be shared as it becomes available. In the interim the accompanying copy of the original TDM approved in 2006 is provided for initial review.

[2] There are approximately 12 designated spaces for rideshare vehicles to park closer to the MOB/Hospital than the south parking lot.

Alternative Transportation/Travel Demand Management Plan

TDM Objective: To establish a set of strategies that encourages Mercy employees to use alternatives to driving to work unaccompanied. This would enable Mercy to successfully provide parking to all employees, visitors, patients, and physicians in the designed parking plan, which has been established at 5% below Mercy's anticipated parking capacity need.

The literature on travel demand management (TDM) identifies three basic goals for TDM programs:

1. decreasing driving alone
2. reducing the number of trips per week
3. reducing the number of peak hour trips

Goals:
Mercy's Alternative Transportation/Travel Demand Management Plan includes objectives and strategies for each goal:

Strategy	Objective	Tactics
Decrease driving alone	• Establish and market a Mercy Rideshare Program	• Use Mercy Intranet as a portal for an in-house rideshare electronic "matching program"; market through employee orientation program. • Provide incentives for carpooling, such as preferential parking for carpools of 2 or more persons at Fore River site, or monthly prize raffles. • Evaluate financial incentives for car pooling.
	• Promote use of public transportation to Mercy campus	• Promote public transportation alternatives through employee newsletters, intranet, and employee orientation. • Offer employees a 50% subsidy for use of monthly bus passes; investigate using a Section 132F Plan • Encourage managers to review work schedules and provide employee flexibility in work start times to meet bus schedules. • Meet with public transportation providers to review existing service levels and opportunities to improve service levels.
	• Promote walking and bicycle use.	• Ensure availability of bike racks and shower facilities. • Construct pedestrian connector and encourage its use.

Stagger the arrivals at Mercy Fore River	• Increase use of compressed work schedules. • Increase use of flexible hours	• Expand use of 4/10 and 3/36 work schedules to departments beyond nursing (currently over 80% of nurses are on compressed schedules) • Encourage managers to evaluate opportunities for increased use of flexible hours.
Reduce peak hour trips	Continue to refine three-shift schedule.	• Encourage managers to evaluate opportunities to shift employee schedules away from traditional patterns.

Implementation:
Mercy Fore River will target formal implementation of the Plan on with the opening of the new facility.

Measures:
Given that the current parking plan is sized at 5% below predicted need, Mercy will strive to have a parking use rate of 95% or lower at all times (or establish a confidence level of 95% that a space is available for the "next arriving vehicle"). Mercy will also strive to have zero parking complaints related to availability of spots (vs. proximity of spots).

Monitoring:
Annually, covering all shift times, Mercy will monitor parking space usage and traffic turnover to determine traffic flow and lot usage against hospital staff and visitor traffic. The responsibility for this function will be held by the Director of Plant and Engineering who will work with the Manager of Security to implement monitoring plans. These will include examining parking space vacancy rates/shifts in comparison to the numbers of employees and patients. Mercy's monitoring will be implemented in a way that reviews parking lot usage during peak times as well as different seasons. Mercy will use direct feedback as well as patient and employee satisfaction surveys, to monitor parking complaints.

Fall Back Alternatives:
In the event that TDM efforts are not successful or successful enough, Mercy would use some combinations of fallback alternatives, such as remote parking with shuttles or seeking additional parking on-site. Ultimately, the parking management plan, and thus the TDM plan, calls for a parking garage with implementation of Phase II.

Att. N

One City Center
Portland, Maine 04101

Dear Mr. Van Slyke:

This refers to Department of the Army permit number NAE-2012-00084, which authorized your client, Mercy Hospital, to fill approximately 3.49 acres of freshwater wetland adjacent to the Fore River at Portland, Maine in order to expand an existing hospital complex.

In accordance with your recent request, the time limit in which to complete the work authorized by the permit is hereby extended to December 31, 2022.

All other conditions of the permit remain in force and effect.

BY AUTHORITY OF THE SECRETARY OF THE ARMY:

Frank J. Del Giudice
Chief, Permits & Enforcement Branch

ENVIRONMENTAL AND LANDSCAPE FEATURES

The following statements are provided in accordance with the Section 14-526 of the ordinance.

(b) Environmental Quality Standards

Preservation of Significant Natural Features (14-526 (b) 1), if applicable

- *Trees, plants, habitats listed on State or Federal list of endangered or threatened*
- *High and moderate value waterfowl and wading habitat*
- *Aquifers on Casco Bay Islands*
- *Waterbodies (including wetlands, watercourses, significant vernal pools and floodplains)*
- *Proposed preservation areas and protection measures*
- *Documentation from environmental consultants, determinations from applicable state agencies*

1. *Preservation of Significant Natural Features:*

   - In 2012, Normandeau Associates completed an onsite investigation to delineate wetlands and to identify resources that may be subject to regulatory review as part of the proposed amended development process. A copy of their wetlands report is included with the original submission material on file with the City. The wetlands were delineated according to the 1987 Corps of Engineers Wetlands Delineation Manual (Technical Report Y-87-1) as clarified in Performance Standard and Supplemental Definitions for use with the 1987 Corps Manual (August 1, 1995). This multi-parameter approach uses the characteristics of vegetation, soils and hydrology in determining wetland boundaries.

     The existing site was historically used as a railyard, a construction staging site, a materials stockyard and a borrow pit among other land uses. Since Mercy's acquisition and development of the Phase 1 Hospital, the site has undergone significant change and aesthetic improvement. The former borrow pit has largely reverted to a naturalized condition with pond features that have supported wildlife habitat and aesthetic appeal over time. However, Mercy has sought and has been granted approval by the MDEP and USACOE to fill in the former borrow pit entirely to achieve their proposed long-term development goals. Thus, this part of the site will be altered as part of the current development proposal. Other important site areas include the waterfront zones associated with the existing northern and southern open spaces that will remain place. The northern open space contains 3.32 acres of open area that contains a shorefront pedestrian path and several seating areas overlooking the Fore River. This open space is access from the Fore River Parkway Trail and is open to the public. The southern open space, located just south of the Veterans Bridge contains 0.99 acres also overlooking the Fore River.

     The current MDEP and USACOE permits authorize Mercy's intentions to fill the previously existing gravel pit area for the proposed development activity. As the current plans do involve changes to the development plan previously approved, Mercy will be filing a project amendment with each agency and these applications are expected to be reviewed concurrently with the Site plan application to the City.

- The does not contain any population of trees or plants that are on the official list of endangered and threatened plans in Maine. Nor does the site contain any habitat for endangered or threatened species, high or moderate value waterfowl and wading bird habitat or significant wetlands or vernal pools.

Landscaping and Landscape Preservation (14-526 (b) 2 a)

- *Preservation of trees and preservation within required zoning setbacks (Technical Manual, Section 4)*
- *Protection measures of existing vegetation during construction*
- *Protection measures within Shoreland Zone, if applicable*

2. Landscaping and Landscape Prevention:

a. Landscape Preservation.

(i) The existing tree coverage within the basin area will be largely removed to allow for filling of the pond. A very limited number of larger trees at the very top of the basin perimeter may be retained when possible, however trees along the embankments and in the pond will be removed. A number of trees and shrubs will be removed around the parking lot within which the hospital expansion will be constructed. The majority of the site will remain unchanged with the now well-established vegetation that was planted in 2008 now coming to maturity and providing a well screened and aesthetically appealing site, particularly for the Portland Peninsula.

(ii) Not applicable.

(iii) There is no specific vegetation protection required on the site.

(iv) The Applicant will request a waiver from this standard.

(v) Not applicable.

Landscaping and Landscape Preservation (14-526 (b) 2 b i)

a. Screening and buffering of service areas and between non-residential and residential uses
b. Planting plans with plant schedule and sizes

2. Landscaping and Landscape Prevention:

b. Site Landscaping:

(i) Landscaped Buffers:

(a) There is an existing loading area at the rear of the existing hospital and this area will remain open. All trash collection will be within a secure area at the rear of the hospital at ground level and is relatively screened from view simply by topography.

(b) The site is fully landscaped and contains significant tree screening along all sides.

(c) Not applicable.

(d) Not applicable.

Landscaping and Landscape Preservation (14-526 (b) 2 b ii)

Parking Lot Landscaping, if applicable

- *Landscaped islands within parking areas (Technical Manual, Section 4)*

2. Landscaping and Landscape Preservation:

a. Site Landscaping.

(ii) Parking Lot Landscaping:

a) thru d) The proposed parking lots will contain landscaping that is consistent with the existing parking lots on the campus. This landscaping is maintained in a well-manicured manner and is considered exemplary for the Portland peninsula.

Street Trees (14-526 (b) 2 b iii)

- *Existing Heritage or Feature Trees on site and measures to preserve*
- *Identify street trees on the plan meeting the site plan and Technical Manual standards (Section 4) or identify alternative measures, if applicable*

2. Landscaping and Landscape Preservation:

b. Site Landscaping.

(iii) Street Trees:

(a) The Fore River Parkway contains a large number of trees along the waterfront side of the road, between the Parkway Trail and the road. Along the Mercy frontage there are a substantial number of existing trees and shrubs between the north parking lot and the Parkway. There is a maintained lawn area along the site frontage between the two site driveways and more trees and shrubs somewhat interior to the site. The south parking lot contains significant tree and shrub plantings that meet or exceed the City standards including street trees that extend up to the Veterans intersection. The landscape architect will coordinate plantings with the City arborist.

ENVIRONMENTAL AND STORMWATER

The following statements are provided in accordance with the submission checklist and Section 14-526 of the ordinance.

(b) Environmental Quality Standards

Water Quality, Stormwater Management and Erosion Control (14-526 (b) 3 a)

- *Stormwater report in compliance with Section 5 of Technical Manual and DEP Chapter 500 stormwater for basic, general and flooding standards, as applicable*
- *Erosion control plan and measures*
- *Evidence of compliance with Urban Impaired Stream Standards pursuant to DEP Chapter 500 stormwater, as applicable*
- *Subsurface sanitary sewage disposal and groundwater protection*

3. Water Quality, Stormwater Management and Erosion Control:

a. Stormwater:

(i) The Mercy Fore River Campus contains an expansive drainage system for the collection, treatment and conveyance of stormwater runoff to the Fore River. The campus setting is located adjacent the Fore River, which is under tidal influence, thus, Mercy has previously requested and been granted, a waiver of the flooding standards under both the State and Local stormwater rules. The existing site was developed in 2006, and at the time the water quality standards involved the Total Suspended Solids (TSS) requirements. To achieve compliance, the development included multiple hydrodynamic separators and vegetated treatment swales that function to remove suspended sediments from the runoff flow leaving the site. For the proposed Phase II hospital expansion and Ambulatory Surgical Center, a wet pond will be constructed within the southwest corner of the existing basin. The wet pond has been designed to comply with the MDEP BMP manual design guidelines. The existing systems and TSS devices will remain in place and the new wet pond will function to treat the new impervious areas created as part of the Phase II development. A full Stormwater management report is contained within the application materials and the report provides evidence for compliance with the City's Stormwater management regulations.

(ii) The site's stormwater runoff is collected and conveyed by multiple closed systems that ultimately discharge to the Fore River. The north end of the site basically drains thru a closed drainage system and two hydrodynamic separators to a 36" storm drain across the Parkway and into parallel vegetated treatment swales before discharging into the River. The central area of the site drains to a closed drainage system and an 18" storm drain that discharges to the River. The existing pond discharges into a closed pipe system that also crosses the Parkway and discharges to the River. Finally, the south parking lot drainage includes a closed drainage system, hydrodynamic separator and discharge into parallel vegetated treatment swales within the south open space, before discharging to the river. These systems are adequately sized to handle the development's stormwater runoff

conditions. The proposed wet pond will serve as a quantity control/flood storage measure to reduce the peak flow to the existing drainage system.

(iii) The existing drainage systems within the Fore River Parkway are adequately sized to handle the increase in runoff volume and peak discharge. The stormwater management report contains HydroCAD calculations that evaluate the 25 and 100-year storm events and system capacities. The results indicate there is adequate capacity in these systems.

(iv) The existing drainage systems within the Fore River Parkway are adequately sized to handle the increase in runoff volume and peak discharge.

b. Flooding Standards:

The project will ultimately meet the General Standards under Chapter 500, Stormwater Law (City of Portland Technical Manual, Section 5 – Portland Stormwater Management and MaineDEP Ch. 500, 3 (e)). The Basic Standards will apply to this project and a detailed Soil Erosion and Sediment Control Plan has been developed to address this.

c. Not applicable, not located within an Urban Impaired Stream.

d. Not applicable – not a residential development.

e. Construction at the site will be required to follow Local, State and Federal regulations and will be undertaken under the supervision of a suitably qualified environmental professional. Post-construction activities at the site do not pose a risk of groundwater contamination.

f. The project will be connected to the public sanitary sewer system which is adequately sized for the anticipated project flows.

TRANSPORTATION

The following statements are provided in accordance with the Section 14-526 of the ordinance.

TRANSPORTATION

(a) Transportation Standards

Transportation Analysis – Traffic Impact (14-526 (a) 1)

- *Provisions for pedestrian, bicycle, vehicle, and loading circulation and incremental volume of traffic impacts*
- *Traffic Impact Study (Technical Manual, Section 1) if applicable*

1. *Impact on Surrounding Street Systems:*

   The surrounding street system consists of the Fore River Parkway and the I-295 Interchange to the west and the Veterans Bridge Intersection to the East. The proposed use is considered consistent with the zoning and objectives identified in various City reports; therefore, we believe it results in no significant impact to the surrounding street system. There will continue to be two primary driveways into the site from the Fore River Parkway and each will have sight distance in each direction exceeding 200 feet. The easterly signalized driveway provides primary access from points east of the site, including South Portland, Cape Elizabeth, Scarborough, and the Portland Waterfront. The westerly, unsignalized driveway provides for access from points north and west including from I-295, Portland, Falmouth, Westbrook, etc. The westerly driveway restricts exiting movements to right turns out only. These existing driveways will continue to operate at an acceptable level of service upon the completion of the Phase 2 Hospital relocation, based on the relatively low traffic volumes on the Fore River Parkway and considering the design volumes originally contemplated for that roadway. Gorrill Palmer is currently completing a driveway analysis to evaluate the operating conditions at each driveway and will be providing this for City review under a subsequent submission.

2. *Traffic Impact Study*

   A Traffic Assessment is underway by Gorrill Palmer and this assessment will include trip generation and accident information for the site and surrounding area. The Mercy site was originally approved for a Traffic Movement Permit in 2002 (Div. 06-00035-A-N) and it was permitted for 784 am and 687 pm peak hour trips during the adjacent street peak hours and 990 PM peak hour trips of the generator.

   Gorrill Palmer conducted turning movement counts in January 2017. Adjusting the counts for seasonal factors the actual trip generation is approximately 238 trips in the AM and 237 Trips in the PM peak hours. Thus, the site is well below the permitted trip generation leaving a significant credit for additional trip generation to apply to the proposed expansion and the proposed Ambulatory Surgical Center. The traffic assessment to be completed by Gorrill Palmer will discuss this information and findings in greater detail.

   Any further traffic assessment is subject to the City's peer review.

Access and Circulation (14-526 (a) 2 a)

- *Access and internal circulation, addressing ADA access*
- *Access and egress impacts on traffic flows*
- *Description and use of drive-up features, if applicable*

3. Access and Circulation:

a. Site Access and Circulation.

(i) Vehicular access to the site remains unchanged and includes two primary driveways off the Fore River Parkway. A 24' wide paved loop drive around the site perimeter provides clear and safe access to the interior parking lots. Directional and traffic control signage has been in place and helps provide direction to patients/visitors and also controls onsite speed and circulation. The proposed hospital expansion will involve a dedicated drive off the perimeter loop road and parking for ER visitors/patients as well as for ambulance services. Mercy is currently working on an updated wayfinding sign package to replace the existing signs as part of a Mercy rebranding effort, now that they are part of the Northern Light Health family.

(ii) We believe the primary points of access will not conflict with any existing turning movements on the Parkway or within the internal circulation drives as well as avoid conflict with any of the existing traffic flow on nearby streets.

(iii) Not applicable as there are no drive through features proposed.

Loading and Servicing (14-526 (a) 2 b)

- *Loading and servicing needs, route and travel way geometrics for deliveries*
- *Turning templates for delivery vehicles, if applicable*

2. Access and Circulation:

b. Loading and Servicing:

(i) Adequate provisions are made at the site for periodic loading from various size trucks to service the Hospital and ASC. There are existing unloading facilities including multiple dock spaces to accommodate Hospital truck traffic at the rear of the existing hospital building. Larger delivery vehicle access is not required for the new hospital building, although ambulance traffic has been accommodated to the ER entrances. The ASC building will have a small loading area at the rear of that building. Given the site's proximity to I-295 and the Veteran's Bridge, the overall accessibility for loading and servicing to the property is considered excellent.

Sidewalks (14-526 (a) 2 c)

- *Sidewalks and condition along street frontages and internal walkways*
- *Engineered details for ADA ramps and public sidewalk details meeting sidewalk materials policy and ADA ramp construction details as applicable (Technical Manual, Section 1)*

2. Access and Circulation:

c. Sidewalks:

(i) The existing site has sidewalks throughout for complete access around the property. There is a pedestrian crossing signal at the southerly driveway on the Parkway which connect pedestrians to the Fore River Parkway Trail and to points north and south i.e. Veterans Bridge and Congress Street. The Parkway was not constructed with a sidewalk along the site frontage except between the southerly driveway and the Veteran's Bridge Intersection. The applicant is requesting a waiver to provide curb and sidewalk from the southerly driveway to the north end of the property, as there is no curb in the area today and no drainage systems.

Public Transit (14-526 (a) 3), if applicable

- *Existing available transit services*
- *Proposed site plan design details, such as easement, pad base, and shelter*

3. Public Transit Access.

a. The Fore River Campus is currently served by METRO bus service along the METRO #1 Congress Street route. The Bus service routes through the south entrance off the Fore River Parkway and stops for drop off/pick up at an existing bus shelter adjacent the Medical office Building. The bus exits the north driveway and proceeds to Congress Street.

b. There is an existing METRO stop and shelter located on the site adjacent the existing Medical Office building.

c. The existing bus stop is on the existing sidewalk system that connects the buildings as well as to the Fore River Parkway sidewalk system.

Off-Street Parking: Vehicle & Motorcycle/Scooter (14-526 (a) 4 a and c)

- *Expected parking demand, proposed parking supply, ADA parking, and applicable Zoning Requirements*
- *Address Technical Manual standards (Section 1) for curb cut separation and parking lot layout and locate on site plan*

4. Parking.
a. Location and Required Number of Vehicle Parking Spaces.
c. Motorcycles and Scooter Parking.

i. Gorrill Palmer has conducted a parking study on the campus. In January 2017, GP conducted a parking inventory across the campus to determine the parking supply and demand conditions. There are currently 762 spaces on the campus. At the time of the parking counts, GP determined a peak demand to be approximately 525 spaces, thus leaving a substantial volume of available parking.

The ordinance requirements for onsite parking are as follows:

Land Use	Area (SF)	Ordinance Requirement	Spaces Required
Existing Hospital	138,099	1 sp/500 SF	276
Existing MOB	82,186	1 sp/400 SF	205
Proposed Hospital Expansion	54,889	1 sp/500 SF	110
Ambulatory Surgical Center	34,987	1 sp/400 SF	88
		Total	**679**

Upon completion of the proposed expansion and ASC, the total onsite parking supply will be 858 parking spaces which exceeds the ordinance requirements. On the basis of the parking demand study performed by Gorrill Palmer, we believe there will continue to be more than adequate onsite parking available for the proposed Hospital expansion and ASC.

ii. Mercy provided a Transportation Demand Management Plan as part of the original Site plan process in 2006 and they continue to provide oversight of their TDM initiatives. An update to the TDM plan is currently underway and it will be submitted for review upon completion.

iii. Please see above.

iv. Parking aisles and dimensions on the existing parking lots meet the applicable standards. All new parking areas will continue to meet similar standards.

v. All new surface parking shall be paved.

The site plan has been developed to allow safe passage and parking for motorcycles and scooters within the surface parking lots.

Bicycle Parking (14-526 (a) 4 b)

- *Address bicycle parking requirements and identify locations on-site*
- *Construction details for bike racks (Technical Manual, Section 1)*

4. Parking.

b. Location and Required Number of Bicycle Parking Spaces.

The hospital currently provides several bike rack locations on the campus that satisfy the demand for bike parking. There is an existing rack at the north end of the existing hospital that will need to be relocated due to the expansion and the relocation is identified on the site plan. A second rack is located at the employee ground level entrance at the south end of the existing

Existing Bike Rack at North End of Hospital

hospital. This rack will remain in place. New bike racks will be provided at the ASC entrance area as identified on the site plan.

The applicant is requesting a waiver of the required number of bicycle parking spaces as that would exceed well over 50 bike spaces which is considered excessive for the Hospital use.

Existing Bike Rack at North End of Hospital

Snow Storage (14-526 (a) 4 d)

- *Management plan for snow removal and locate snow storage areas on plans*

4. Parking.

d. Snow Storage.

i. The Hospital campus includes a snow dump at the far south end of the site. Snow removal on the site will continue to be managed by contracted services and snow will be plowed and moved to this stockpile area in accordance with previously approved MDEP standards and requirements.

ii. The hospital provides snow removal on the pedestrian walks across the campus and removes snow to avoid displacement of any onsite parking.

Traffic Demand Management (TDM) (14-526 (a) 5), if applicable

- *Develop TDM with Trip Reduction Targets and Strategies*

5. Transportation Demand Management (TDM).

a. A Transportation Demand Management (TDM) Plan will be prepared and submitted for Planning review within the upcoming application review period. Mercy Hospital is currently reviewing and updating the original TDM plan associated with the Phase 1 development.

Response to City (Peer Review) Request for Additional Information
Mercy Hospital Phase II Expansion – Portland, Maine
JN 3257.04

Date: November 14, 2019
Subject: Response to City's Peer Review Request for Additional Information
Mercy Hospital Phase II Expansion
To: Nick Munro, Northern Light Health
From: Randy Dunton, Gorrill Palmer

GP had submitted a Parking and Driveway Mitigation Evaluation for this project dated September 10, 2019. Mr. Errico requested additional information to supplement that submittal in an email dated October 24, 2019. For ease of review, we have repeated Mr. Errico's **requests** followed by our *response shown in italics*:

Request: The parking inventory for the site should be expanded to 6pm. The data presented indicates a peak parking demand at 2pm (the end of the survey). We would like to confirm that parking demand does not increase after 2pm. A graphic shall be provided that generally depicts the location of available spaces.

Response: To confirm the peak parking demand, additional occupancy counts were completed on Wednesday November 6, 2019 from 1:00 PM to 6:00 PM. The Lot numbers are consistent with the previous submittal. The following table summarizes that count data.

November 6, 2019 Parking Occupancy Count

Lot	*Total Number of Spaces Available*	*Number of Parked Vehicles*					
		1:00 PM	*2:00 PM*	*3:00 PM*	*4:00 PM*	*5:00 PM*	*6:00 PM*
1	*34*	*23*	*22*	*16*	*15*	*9*	*8*
2	*50*	*45*	*48*	*47*	*37*	*13*	*6*
3	*101*	*54*	*55*	*49*	*48*	*14*	*4*
4	*162*	*100*	*111*	*108*	*87*	*50*	*32*
5	*105*	*57*	*52*	*58*	*54*	*36*	*31*
6	*310*	*216*	*205*	*176*	*119*	*61*	*37*
Total	***762***	***495***	***493***	***454***	***360***	***183***	***118***

As can be seen from the above table, the peak parking demand of 495 spaces is less than the 514 spaces identified in the September 10, 2019 evaluation as the peak. It should be noted, that to be conservative, GP had increased the 514 spaces in the last submittal up to 525 spaces.

Request: For comparison purposes, parking demand estimates using the Parking Generation Manual, ITE, 5th edition shall be provided.

Response: The below compares the parking demand rate based on actual counts completed on site, the City Ordinance, and the ITE Parking Generation Manual, 5th Edition using Land Use Code 610 – Hospital and Land Use Code 720 – Medical-Dental Office Building.

Parking Rates (per 1,000 spaces)

	Based on Counts	*Ordinance*	*ITE*
Hospital	*2.54*	*2.0*	*2.25*
Medical Office Building	*2.13*	*2.5*	*3.23*

As seen from the above summary, the actual parking demand rate for the hospital is nearer the ITE than to the Ordinance and the MOB rate is much closer to the Ordinance than to the ITE.

Request: A pedestrian facilities/routing graphic for the entire site shall be provided with anticipated origin-destination patterns to and from each parking area.

Response:

See attached diagram.

Request: The Parking and Driveway Mitigation Evaluation report posted in ePlan does not include the noted Figures. Those should be uploaded. I would also suggest that printouts of the SimTraffic Model results be provided.

Response: To address this request, GP completed turning movement counts on Wednesday, November 6, 2019 at the two site driveways on Fore River Parkway from 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. Wednesdays were identified by the Hospital as being their busiest day. The results of the counts are shown on the attached Figure 2. Similar to the previous submittal, the raw volumes were seasonally and annually adjusted, other development was added, and the proposed development was added to arrive at the postdevelopment traffic volumes shown on the attached Figure 7.

Capacity analysis was completed similar to the previous submittal and the computer printouts are attached. A summary of the results of the capacity analysis is provided in the following summary table.

Level of Service Summary

Approach	Level of Service			
	AM Pre	AM Post	PM Pre	PM Post
Fore River / North Driveway (unsignalized)				
Driveway WB	A	A	A	A
Fore River NB	A	A	A	A
Fore River SB	A	A	A	A
Fore River / South Driveway (signalized)				
Driveway WB	B	B	A	B
Fore River NB	A	A	A	A
Fore River SB	A	A	A	A
Overall	**A**	**A**	**A**	**A**

As shown in the table, the two site driveways are forecast to operate at high levels of service both before and after the campus expansion is completed. This is consistent with the results in the September 10, 2019 evaluations submitted to the City.

Request: In conjunction with site plan standards (see below) a traffic safety study shall be conducted at the High Crash Location (HCL) of Fore River Parkway and Congress Street.

Response: Per request, GP requested and received the latest collision diagram from the MaineDOT (attached) for the high crash location. Based on a review of that collision diagram, there are five patterns:

- *Congress Street Eastbound rear-end (12 crashes)*
- *I-295 southbound off-ramp rear-end (11 crashes)*
- *Congress Street eastbound through traffic angle crash with left turns from Fore River Parkway (3 crashes)*
- *Congress Street eastbound through traffic angle crash with southbound left turns onto Fore River Parkway (4 crashes)*
- *Right turns off Fore River Parkway onto eastbound Congress Street. (4 crashes)*

We offer the following for consideration:

- *The referenced site plan standards indicate the adjacent street. In our opinion, the Fore River Parkway / Congress Street intersection would not fall into that category given the significant I-295 ramps between the hospital and this intersection.*

- *This intersection is included in an existing MaineDOT / City corridor study to coordinate traffic signals from the intersection with Stevens Avenue to this intersection. That study will revise the timing and phasing of this intersection, which would be expected to address and change the existing crash patterns.*

Fore River Parkway

PUBLIC INFRASTRUCTURE AND SAFETY

The following statements are provided in accordance with the submission and Section 14-526 of the ordinance.

(c) Public Infrastructure and Community Safety Standards.

Consistency with City Master Plans (14-526 (c) 1)

- *Identify consistency with master plans*
- *Proposed easements, rights and improvements to connect or continue off-premises public infrastructure, as applicable*

1. *Consistency with City Master Plans:*

    a. The project has been designed to be consistent with the Contract Zoning agreement and off-site infrastructure plans. The site is uniquely placed along the Fore River Parkway and in the 11 years since the Phase 1 Hospital opened, the campus has operated efficiently and without issue with respect to the surrounding land uses, access conditions and overall city peninsula planning. The Mercy site continues to represent a welcoming view for the traveling public on the I-295 and Veteran's Bridge roadways and Mercy continues to offer health care delivery services that are much needed within the community.

    b. Various easements will remain in place for public infrastructure including water supply, power, and sanitary sewer among others. These will remain in place and unchanged. Public access to the north and south open spaces also remains unchanged because of the Phase II activity.

Public Safety and Fire Prevention (14-526 (c) 2)

- *Address Crime Prevention through Environmental Design (CPTED) (Technical Manual, Section 3)*
- *Emergency vehicle access*
- *Address consistency with public safety standards (Technical Manual, Section 3)*
- *Submit a code summary referring NFPA 1 and all Fire Department standards (Technical Manual, Section 3) – Fire Checklist*

2. *Public Safety and Fire Prevention:*

    a. The site has been designed to promote a safe and welcoming environment. Mercy does maintain security on the campus including building entry controls, restricted parking areas, and camera surveillance.

    b. The site provides access from Fore River Parkway for emergency vehicles. A secondary emergency access from County Way also is provided, although it is gated and is available for emergency use only.

    c. Fire hydrants are located throughout the property. The buildings are fully sprinklered. A summary letter to Division Chief Thompson is included at the end of this section.

Availability and Adequacy of Public Utilities (14-526 (c) 3) (Technical Manual, Sections 2 & 9)

- *Electrical services, including providing underground services*
- *Identify existing and proposed connections for public utilities and required public utility upgrades*
- *Sewer line connections are required, if there is a main within 200 feet*
- *Proposed solid waste management facilities on-site and management for the site*
- *Written evidence of the ability to serve from utility companies, as applicable*

a. The Applicant is securing letters from the applicable utilities stating their ability to continue to serve the site. The project will require new electrical, gas, sewer, and water services to the ambulatory surgical center, while the hospital expansion will rely on the existing hospital interior utilities.

b. All new electrical services to the ASC site will be underground.

c. All new utility infrastructures from the existing facilities will meet the provisions of the Technical Manual. The ASC will be served by new fire and domestic mains off the PWD 12" water main located on the site. The ASC sewer will connect to the existing Fore River Interceptor sewer located along the rear property line. Power will be from the existing underground primary distribution system that CMP maintains on the property.

d. The project will utilize a new ASC service connection to the public sewer system within the Fore River Interceptor located along the site's rear property line.

e. All new sewer and stormwater infrastructure will meet City standards. Backflow prevention in accordance with PWD standards will be provided in the ASC.

f. A solid waste collection and storage area will be provided with adequate capacity for the needs of the ASC development. Mercy maintains their existing solid waste collection equipment at the rear of the existing hospital where it will remain upon completion of the Phase II expansion.

Ability to serve letters will be forwarded to the planning office upon receipt.

12.0 INTRODUCTION

Northern Light℠ Mercy Hospital (Mercy) is an acute care, non-profit hospital located in Portland, ME and is licensed for 200 in-patient beds. Mercy has over 1,604 employees, 743 medical staff, and over 125 volunteers. Mercy has served the greater Portland community for over 100 years opening its current 144 State Street Campus in 1943. In the early 2000s, Mercy Hospital's strategic plan identified important objectives that could not be achieved at the 3.5-acre State Street site, given its age, size, location and Portland's Historic District constraints. Mercy chose to relocate from their State Street site and move to the Fore River Campus in order to meet important strategic obligations and maintain appropriate standards of care that were in jeopardy long-term if the Hospital were to remain at State Street. A two-phase move was planned due to various circumstances. In 2001, Mercy first was granted a Site Location of Development Approval from the Maine Department of Environmental Protection[1]. Mercy also executed a Contract Zone Agreement with the City of Portland to allow the Hospital Campus on what at the time, was Industrial zoned land, within which a Hospital land use was not a permitted use. With these approvals in hand, Mercy acquired the land from the original owners, Portland Terminal Company and P.D. Merrill. Mercy obtained a Certificate of Need approval from the State of Maine in 2006. The first phase of the move to the Fore River campus was completed in 2008 with the construction of the Phase 1 hospital facility and the adjoining medical office building (MOB), ancillary facilities including surface parking for 762 vehicles, utilities, snow storage, and a maintenance building were also constructed. In 2013, Mercy approached the Maine Department of Environmental Protection and the US Army Corps of Engineers with a long-term plan for the Hospital needs on the Campus. This involved the expansion of building(s) and parking facilities that encompass filling of the former gravel pit entirely. Based on the long-term plans and supporting evidence, both the MDEP and the USACOE approved development plans that result in the complete filling of the existing basin. Both agencies accepted as compensation for the impacts to the basin resource, Mercy's participation in the In-Lieu Fee Compensation program. Mercy has provided a contribution of $834,156 to the State to satisfy the NRPA condition of approval, thus establishing their standing to move ahead with filling of the onsite basin.

The proposed project represents Phase 2 which includes the construction of a 19,260 SF footprint building addition to the existing hospital and a 17,610 SF footprint Ambulatory Surgical Center (ASC). The hospital expansion will be directly connected to the existing Phase 1 Fore River Hospital, while maximizing site safety and allowing for a future Phase 3 expansion that will be in close proximity to the ASC. The ASC will be positioned within the existing basin area so that it provides relatively close proximity to the Hospital while also maintaining its own parking and stand-alone features, given its outpatient services programing. Figure 1 is a map showing the project location.

Mercy is currently seeking a Site Plan Permit from the City of Portland and an Amendment to the Site Location of Development Permit from the MDEP. The project combines redevelopment and new construction on a site that has previously received a Site Location of Development Permit. The proposed project is subject to the standards of MaineDEP's Chapter 500 Rules for Stormwater Management and City of Portland Stormwater Management regulations. The plans prepared by Gorrill Palmer include the infrastructure necessary to serve the project and to comply with current local and state stormwater standards. Erosion and Sedimentation Controls (Basic Standards) will be

employed during the construction of this project and are summarized in the Erosion and Sedimentation Control Plans provided on Sheets C-4.0, C-7.5, and C-7.6.

12.1 EXISTING SITE CONDITIONS

The project boundary is located within the parcel bounded by the Fore River parkway to the west, the railroad to the north and east and the new Veteran's Bridge to the south. This portion of the lands owned by Mercy Hospital is comprised of 33.51 acres.

Topography varies across the site and can be broken down into two areas. The north end of the site is generally 14 feet higher than the south end. The north end is slightly rolling and designed to provide access to the first floor of the existing hospital (FFE 32) and Medical Office Building (FFE 30). The southerly end of the site is relatively flat and designed to access the ground floor/service area of the hospital at finished floor elevation 17.5. The northerly developed portion of the site ranges from elevation 20 to 36. The southerly portion of the site ranges from elevation 10 to elevation 19 with isolated mounds up to elevation 26.

The soils on the site are shown on the USDA medium intensity soils map to be Hinckley gravelly sandy loam, Cut and Fill land and Gravel Pit. The historical gravel pit operations and Phase I construction of the property has modified all of the original surface soils from their original classification to a "Cut and Fill" classification. A mix of native and imported soils was used to construct the parking lots and structural fill for the buildings.

The existing drainage is divided into four areas; all four areas are tributary to a storm drainage network comprised of precast catch basin inlets and HDPE storm drainage piping. There are four points of discharge from the site into the Fore River. Referring to the Existing Conditions plan, the points of discharge are listed below, from North to South:

- 36" culvert – runoff from medical office building and associated parking lot discharging into a vegetated treatment swale.
- 15" culvert - runoff from the hospital building and service area and discharges directly to Fore River
- 18" culvert – runoff from perimeter access road and wetland area discharges directly to Fore River
- 36" culvert – runoff from parking lot and maintenance yard discharges directly to Fore River

12.2 DEVELOPMENT DESCRIPTION

The Phase 2 development site comprises approximately 4.62 acres of the 33.5-acre site. Approximately 26.9 acres of the site have been previously developed for the original Phase 1 project. Approximately 1.9 acres of the current project area is currently developed with pavement and grassed area. The southerly portion of the project site contains a former gravel pit that has become a pond. The applicant has previously received a permit to fill the pond and has completed the In-Lieu fee payment to the MDEP.

Abutting land uses include:

- North – Railroad/Cumberland County Jail
- East – Railroad/Commercial/MMC Parking Garage
- South – Medical/Railroad/Cassidy Point
- West – Fore River Parkway/Fore River

Runoff from the site is tributary to the Fore River. The Fore River is not currently listed as an "Urban Impaired Stream", therefore, the development will not be required to meet the Chapter 500 Urban Impaired Stream Standard.

Changes in land cover will include removal of paved surfaces, wooded areas, and grassed areas through portions of the project site and the addition of roof, paved surfaces, and lawn areas. The existing impervious area within the limit of work is approximately 1.25 acres. The existing developed area is approximately 1.9 acres. The overall proposed impervious area for Phase 2 is 3.88 acres, and the overall proposed developed area is 4.77 acres.

The following sources were used for preparation of the North Village stormwater quality analysis:

1. Stormwater Management for Maine, Volume III BMPS Technical Design Manual, MaineDEP, May 2016
2. A Current Assessment of Urban Best Management Practices, Techniques for Reducing Non-point Source Pollution in the Coastal Zone, U.S.E.P.A. Office of Watersheds, March 1992.
3. MeDEP Chapter 500, Stormwater Management Rules.

Computer programs used to assist in the various components of this analysis include:

1. HydroCAD 10.00, HydroCAD Software Solutions LLC – used for modeling watersheds for pre and post development conditions.
2. Microsoft Excel, Microsoft Corporation – used for spreadsheet computations.
3. AutoCAD Civil 3D 2010, 2011, and 2019, Autodesk - used to determine areas and graphical representation of design.
4. AutoDesk Storm and Sanitary Analysis 2019 – used to analyze storm drain network performance during specified storm events.

Data resources used to obtain the hydrologic input data for the stormwater models are identified later in this report.

12.4 OVERVIEW OF STORMWATER RUNOFF MODELING

The stormwater analysis evaluates the following elements:

- Predevelopment and post development stormwater runoff and peak discharge rates; We have updated the Mercy Hospital model with an examination at the original points of analysis now considering the Phase 2 development;
- The impacts of the proposed development and subsequent modification to site discharge rates and locations;
- The effect of land cover modifications within the site, especially those that are expected to increase site runoff rates;
- The requirements for stormwater management including compliance with Chapter 500 flooding standards (**A waiver is being requested from the flooding standard due to the site's proximity to the Fore River: A waiver was previously granted by the MDEP and the City during the Phase 1 permitting period)**;
- Storm drainage requirements for parking areas, roof areas and other improvements; and
- Requirements for water quality measures.

12.5 METHODS OF ANALYSIS – STORMWATER QUANTITY

The hydrologic analyses for predevelopment and post development conditions have been conducted based upon the methodology contained in the USDA Soil Conservation Service's Technical Releases No. 20 and 55 (SCS TR-20 and TR-55) as modified for special site conditions. For this section of Cumberland County, Maine, a 24-hour SCS Type III Storm distribution was used for the analysis using the following storm frequencies and rainfall amounts:

Storm Event	24-Hour Rainfall (Post 2014)
2-Year Storm	3.10
10-Year Storm	4.60
25-Year Storm	5.80
100-Year Storm	8.10

The HydroCAD computer program was used in the analysis. This program determines the critical points of the project watershed and uses SCS TR-20 methodology for evaluation of the anticipated conditions at these points.

Land use, cover, delineation of watershed subcatchments, hydraulic flow paths, and hydrologic soil types were obtained using the following data:

1. Portland West, Maine USGS 7.5-minute Quadrangle Maps.
2. Cumberland County, USDA Medium Intensity Soils Survey.
3. Onsite Topographic Survey with 1-foot contour intervals prepared by Owen Haskell, field reconnaissance by former Deluca-Hoffman Associates Inc, staff now with Gorrill Palmer.
4. The Class C Medium Intensity Soil Survey for the watershed areas.

12.6 DESCRIPTION OF SITE WATERSHED MODEL

The watershed model was developed to predict peak discharge rates emanating from one point of analysis for the post development condition. The post development condition includes the developed area of the building expansion, ASC building, and associated parking.

12.7 PRE-DEVELOPMENT CONDITIONS

The existing impervious area within the limit of Phase 2 work is approximately 1.25 acres. The existing developed area is approximately 1.9 acres.

There are no lakes located on, adjacent to or downstream of the project site and the project site is adjacent to the tidal Fore River. An existing manmade pond occurs onsite. The existing basin resulted when the Railroad excavated the pit for the extraction of gravels and borrow, beginning in the 1950's. Mercy Hospital received approval from the MDEP and US ACOE to fill the pond and adjacent wetlands upon payment of an in-lieu fee which was paid in 2013. Excavation activity

extended to below the groundwater table, thus the basin has had a permanent pool for greater than 30 years. Prior to the development of the Fore River Parkway, the basin had a ditch outlet that connected to a culvert that passed under multiple rail tracks[2], within the area now occupied by the Parkway Road. The culvert discharged into the river, thus the basin has always had an outlet to the river.

The existing pond receives runoff from existing vegetated developed area and existing impervious area consisting of roof, access drives, loading areas, and mechanical pads. The Existing Conditions Plan shows the edge of the pond between elevation 8 and 9. The existing pond outlet consists of a 15" diameter storm drain pipe with an invert elevation of 7.78. The storm drain system increases to an 18" diameter outlet pipe that conveys runoff to the tidal Fore River. The invert of the outlet pipe is at the approximate high tide line (estimated at around elevation 5.0±'). The outlet area consists of a stable area of rip-rap/boulders. There is no wetland area between the existing outlet storm drain and the storm drain system outlet at the Fore River.

Based upon the FEMA maps, a Zone A 100- year floodplain is associated with the Fore River. No part of the proposed development is located within the Zone A 100-year floodplain. To the best of our understanding, there is no salt water intrusion into the basin, either from backwater effects from the River or thru the groundwater/saltwater interface[3].

12.8 POST DEVELOPMENT CONDITION

The overall proposed impervious area for Phase 2 is 3.88 acres, and the overall proposed developed area is 4.77 acres.

The development will be required to meet the MDEP's water quality standards. In order to meet the water quality standard, the project will utilize a wet pond. The wet pond, with additional detention above the water quality volume elevation, will be utilized to control the post development runoff for larger storm events. Although the Flooding Standard is asked to be waived for this project, the pond's performance during larger storms was analyzed to assess the effects on the existing infrastructure including the closed drainage system that conveys flow across the Parkway and discharges into the River.

The proposed storm drain system consists of multiple catch basins, manholes, and storm drain piping which conveys the site runoff to stable outlet locations. Most of the stormwater runoff within the project's limit of work is conveyed to the proposed wet pond for water quality treatment. Stormwater runoff from the developed area adjacent to the existing Medical Office Building will be conveyed to the existing storm drain system. By inspection, it can be seen that the runoff to the existing system will be reduced since the existing parking lot of the Hospital Building will be redeveloped, and the runoff will be redirected to the wet pond.

The flow to the proposed storm drain system was calculated using the Rational Method for the 25-year storm event based on the Portland rainfall intensity curves. The storm drain performance while

[2] The site was used as a railyard with numerous sidetracks up until the 1960's. Remnants of the tracks remain along the site's waterfront zone.
[3]MDEP records indicate a Highest Annual Tide of elevation 7.4'.

conveying runoff from the 25-year storm was calculated using Autodesk Storm and Sanitary Analysis 2019. The proposed piping has capacity to convey the runoff to the wet pond. The calculations are included in Attachment C.

A proposed swale that will also convey runoff to the wet pond was analyzed for capacity using the FHWA Hydraulic Toolbox, which calculates the swale capacity, based upon the Manning Equation. The results for the two sections of the swale analyzed are included in Attachment C.

12.9 APPROACH AND ANALYSIS FOR QUALITY AND QUANTITY

The proposed development will be required to meet the Basic Standard and the BMP Standard under the General Standards for a Site Law project. Based upon our review of the four recommended and approved methods for mitigating the increased frequency and duration of channel erosive flows, as required by the BMP Standards, Mercy Hospital is proposing to use a wet pond. The existing pond area will be modified to provide the required stormwater quality treatment. As part of the previous SLDA permit, the existing pond area was approved for filling. We believe that the current Phase 2 proposal is well suited to using a portion of the existing basin area as a wet pond, since the outlet is already in place and the amount of retrofit work is limited.

Since the project is an amendment to an existing SLODA Permit, the Basic Standard, General Standard, and Flooding Standard apply. The stormwater runoff from the project site is directly tributary to the Fore River that is tidal at this location. Since the site is tributary to the tidal river and as previously approved in the existing SLODA Permit, **the Applicant is requesting a waiver from the Flooding Standard.** Although the Applicant is requesting this waiver, a HydroCAD model has been prepared and attached that analyses the storm drain network and wet pond for peak discharge conditions.

The project site contains developed area as well as undeveloped area. The portion of the project within the previously developed area will be analyzed as a redevelopment project. The portion of the project within the undeveloped area of the site will be analyzed as new construction. The new construction will require treatment of no less than 95% of the impervious area and 80% of the developed area. The portion of the project categorized as redevelopment is summarized below.

In order to determine the treatment required for the project, the addition to the existing building and adjacent parking lot has been analyzed as redevelopment. Chapter 500 uses a pollutant ranking to determine the required treatment for a redevelopment project. The required treatment has been calculated based upon the pollutant ranking system presented in Section 4.C.d.1 of Chapter 500. A redevelopment boundary encompassing 1.9 acres was used to determine the pre and post development pollutant ranking as shown on the Watershed Maps included in Attachment A.

The following tables present the pollutant ranking calculation as outlined in Section 4.C.2.d of Chapter 500.

TABLE 1 PRE-DEVELOPMENT POLLUTANT				
Type	**SF**	**Acres**	**Pollutant Ranking**	**Total (acres x pollutant)**
Roads/High Use Parking	0	0	5	0.00
Other Roads/Medium Use Parking	45,395	1.04	4	4.17
Other Parking/Driveways	2,575	0.06	3	0.18
Other Roof/Walkways/Grassed Areas mowed more than twice per year	26,600	0.61	2	1.22
Non-Grassed Landscape	6,875	0.16	1	0.16
Forest/Meadow mowed no more than twice per year	0	0	0	0.00
			Total	5.72
			Redevelopment Area (ac)	1.90
			Total/Redevelopment	3.06

TABLE 2 POST-DEVELOPMENT POLLUTANT				
Type	**SF**	**Acres**	**Pollutant Ranking**	**Total (acres x pollutant)**
Roads/High Use Parking	26,823	0.62	5	3.08
Other Roads/Medium Use Parking	0	0	4	0.00
Other Parking/Driveways	13953	0.32	3	0.96
Other Roof/Walkways/Grassed Areas mowed more than twice per year	37,402	0.86	2	1.72
Non-Grassed Landscape	3,267	0.08	1	0.08
Forest/Meadow mowed no more than twice per year	0	0	0	0.00
			Total	5.83
			Redevelopment Area (ac)	1.90
			Total/Redevelopment	3.12

The impact change = 3.12 - 3.06 = 0.06 from Table 3 of Chapter 500 Section 4.C.2.d the Percentage of Developed Area that must be treated is **60%**.

Watershed Maps W1 and W2 depict the cover type used for the pollutant ranking calculation and are included in Attachment A of this report.

12.10 STORMWATER MANAGEMENT SUMMARY

Under the General Standard, the project is required to meet the BMP Standards, as the development site is not tributary to a lake watershed. The project contains new construction as well as redevelopment and will be required to meet the treatment standards based upon the pollutant impact ratings for redeveloped areas and the standard treatment requirements as presented in

Chapter 500. The following section summarizes the Wet Pond that serves as the central Stormwater BMP being utilized for the proposed development.

12.10.1 Wet Pond

Water Quality Measures

The wet pond requires a permanent pool volume with a minimum storage volume of 2.0 inches times the pond's tributary impervious area plus 0.8 inches times the pond's tributary non-impervious developed area. The permanent pool should have a minimum mean depth of 3 feet. The mean depth is defined as the pond volume measured at one foot below the permanent pool elevation, divided by the surface area at that elevation.

The wet pond must provide a channel protection volume of 1-inch times the pond's tributary impervious area plus 0.4-inch times the pond's tributary non-impervious developed area. The channel protection volume is released over a 24 to 48-hour time period. When the outflow of the pond is to a tidal water, an underdrained gravel trench is not required. The wet pond BMP appears to require Channel Protection storage when the outflow is tributary to a tidal waterbody while Chapter 500 does not appear to require the Channel Protection storage. In order to be conservative, Channel Protection storage has been provided.

Wet ponds are not typically located within a wetland. The MDEP previously approved the filling of the existing pond/wetland; therefore, the pond site is no longer a regulated wetland. The existing water elevation of 8 to 9 feet is the approximate groundwater elevation as this was established when the existing outlet culvert was installed. This level also coincides with the generally groundwater table as it is noted that the basin was formed as result of historic excavation activity for the extraction of gravel and borrow material by the railroad many years ago. The BMP Chapter 4 states that a wet pond with its pool surface at the elevation of the groundwater table can be acceptable if the discharge outlet is an acceptable receiving channel and is stable under a constant discharge. The current and proposed pond outlet is a storm drain which conveys the runoff to the tidal river. The existing storm drain outlet is stabilized with riprap. The proposed wet pond pool elevation is 9.5 which is slightly higher than it is today.

The majority of the pond's tributary runoff will enter the pond at the north end through a sediment forebay consisting of a stone bermed level lip spreader. The outlet structure is located at the south end of the pond resulting in a length to width ratio greater than 3:1. Runoff from the southerly access drive is tributary to the southerly end of the wet pond. The tributary impervious area of the access drive is approximately 1.6% of the total tributary impervious area. The runoff is directed away from the pond outlet. Since the access drive area is a small percentage of the total tributary impervious area, it is the opinion of Gorrill Palmer that having less than a 2:1 length to width ratio for this contributing runoff quantity is insignificant.

The channel protection volume will be provided above the permanent pool elevation. The channel protection outlet will consist of an orifice set at the permanent pool elevation and designed to release the channel protection volume in 24 to 48-hours. The existing 15-inch

diameter culvert will be connected to the outlet control structure and will control runoff from the larger storms. A weir will be set at the channel protection elevation to ensure that the channel protection volume passes solely through the outlet orifice.

Subcatchment 1 is tributary to the wet pond and consists of existing roof, pavement, and vegetated area, as well as pavement, roof, and vegetated area from the proposed development. Approximately 73% of the runoff enters the pond at the northerly end through a sediment forebay. A sediment forebay is not proposed at the southerly inlet since the catch basin within the access drive will have a sump and outlet hood, and the runoff will flow through a 140' vegetated channel, which will allow for sediment deposition prior to entering the pond.

Since the wet pond will be located within the site of the existing pond, which is a low point within the landscape, there is not a defined berm, or emergency spillway. The proposed emergency outlet will consist of a trash rack over the open top of the outlet control structure, which will allow for flow through the outlet pipe assuming the inlet weir to the outlet control structure is clogged.

The following table presents the wet pond performance:

TABLE 3
WET POND

Description	Required	Provided
Impervious Area		234,288 SF
Vegetated Developed Area		159,660 SF
Channel Protection Volume	24,846 CF	25,121 CF
Elevation at Channel Protection Volume		10.36 FT
Pond Base Elevation		4.5 FT
Permanent Pool Elevation		9.5 FT
Permanent Pool Volume	49,692 CF	82,236 CF
Pond Volume at Elev. 8.5		61,396 CF.
Surface Area at Elev. 8.5		19,723 SF.
Mean Depth	3 FT	3.11 FT
UD trench Length	N/A Tidal Outlet	
Channel Protection Outflow		0.25 CFS
Release Time	24-48 hours	28 hours

The wet pond storage table is included in Appendix B.

The Water Quality Map depicting the treated area is included in Appendix A.

The building addition and parking area at the northerly end of the site is a redevelopment project. Based upon Section 4.C.2.d of Chapter 500, the redeveloped portion of the project is required to treat 60% of the Developed Area. The total developed area is approximately 81,445 SF (1.9 acres). The approximate impervious area within the developed area is 70,213 SF (1.6 acres). Treatment is required for 48,867 SF (1.12 acres) of the developed area.

Existing developed area that is not within the limit of work is tributary to the proposed wet pond. Since the existing pond does not conform to MDEP BMP's, it is assumed that there is no water quality treatment for the existing runoff. The proposed wet pond will provide treatment for these existing impervious and vegetated areas.

The following table summarizes the proposed treatment.

TABLE 4
STORMWATER TREATMENT

	Impervious	Developed (Impervious + Landscaped)
Redeveloped Area Treated by the Wet Pond (SF)	47,961	58,788
Total Redeveloped Area (SF)	70,213	81,445
Untreated Redeveloped Area (SF)	22,252	22,657
Percent of Redeveloped area treated	68.3%	72.2%
New Construction treated by the Wet Pond (SF)	100,656	128,334
Total New Construction Area (SF)	101,160	128,838
Untreated New Construction Area (SF)	504	504
Percent of New Construction Treated (SF)	99.5%	99.6%
Total Area Treated by Wet Pond Including Existing Area (SF)	234,288	393,948
Total Area of Redevelopment and New Construction (SF)	168,798	207,708
Percent Treated Relative to Proposed Construction (SF)	139%	190%

The wet pond treats 72.2% of the developed redevelopment area, which exceeds the required 60% treatment.

The wet pond treats 99.5% of the new construction impervious area and 99.6% of the new construction developed area, which exceeds the required treatment of 95% of the impervious area and 80% of the developed area.

The wet pond also treats existing developed area, which results in an excess treatment of 44% of the impervious area and 110% of the developed area.

Water Quantity Measures

The proposed project will generate stormwater runoff that is directly tributary to the Fore River. Since the Applicant is requesting a waiver from the flooding standard, the analysis of post-development flow from the current project has been limited to determining the capacity of the existing storm drain outlet from the pond and storm drain system performance during peak tide and storm events.

The storm drain system consists of a 15-inch diameter pond outlet pipe that conveys runoff to 18-inch diameter pipes linking manholes and catch basins, before discharging the runoff at the high-water line of the Fore River.

The soil types are shown on the watershed map included in Attachment A were obtained from the NRCS Cumberland County Medium Intensity Soil Survey. The proposed development occurs over previously developed area labeled as Hinckley soil or over gravel pit, cut, and fill soil types. Post-development vegetated area is assumed to be hydrologic Group C soil for this analysis.

The permanent pool surface area has been assumed to have a CN of 98 with a time of concentration of zero, which results in instantaneous runoff from the pond surface.

The developed portion of the site tributary to the wet pond was modelled as one subcatchment with an assumed time of concentration of 6 minutes due to the large percentage of impervious surface. The post-development watershed map is included in Attachment A.

The wet pond outlet structure was modelled with an orifice outlet for the channel protection volume, and a weir to convey the larger storms. The orifice and weir convey the runoff to the existing 15-inch diameter culvert.

The low point in the drainage system connected to the wet pond is an existing catch basin to the west of the wet pond located in the loading/utility pad area adjacent to the existing building. The catch basin rim elevation is 13.07. The lowest point in the outlet storm drain system is a catch basin adjacent to the Fore River Parkway. The catch basin rim elevation is 15.02.

The wet pond performance for the various storm return periods is presented in the following table.

TABLE 5
WET POND

	Storm Event			
	2 Year	**10 Year**	**25 Year**	**100 Year**
Peak Inflow (CFS)	21.07	35.60	47.24	69.37
Peak Outflow (CFS)	1.23	3.78	6.20	11.85
Stage (Max. Elevation)	10.83	11.41	11.82	12.46
Storage (cf)	41,980	65,264	85,665	122,092
Depth Above Permanent Pool (ft)	1.33	1.91	2.32	2.96

As can be seen from the table above, the maximum stage within the wet pond is 12.46 for the 100-year storm, which is below the existing catch basin rim of 13.07.

The wet pond outlet storm drain is modelled as a series of ponds with insignificant storage with culvert outlets. In order to take into account the effect of the tidal Fore River at the outflow, the highest astronomical tide from the Maine Geologic Survey was set as a fixed tail water within the system. The highest astronomical tide is listed as elevation 6.7 (NAVD 88) at the Fore River. Converting elevation 6.7 to the project datum of NGVD 29 results in an

elevation of 7.4 for the highest astronomical tide. As can be seen in the HydroCAD printouts contained in Attachment B, the peak elevation of the stormwater outflow for the 100-year storm within the outlet storm drain system is below the existing catch basin rims.

The location of the proposed wet pond is within a depression on the project site, so there is not a berm that would be vulnerable to an overflow of the stormwater runoff. There is no overland emergency spillway proposed, since the area surrounding the pond is currently developed. The proposed outlet control structure will consist of a 6-foot diameter manhole with an open top. The top will be protected by a trash rack as shown on the Wet Pond detail sheet included with this report. The maximum opening size of the trash rack is 4 ¾ inches. The trash rack will prevent the outlet pipe from becoming clogged with debris; therefore, it is unlikely that the pond outlet will become plugged and require an emergency spillway to convey the runoff from the pond. In addition to the unlikely clogging of the outlet structure, Attachment B contains a routing of the wet pond with no outflow. The routing shows that the pond is capable of storing the entire volume of runoff from the 25-year storm without exceeding the existing catch basin rim of 13.07. The calculated peak stage of the 25-year storm routed to the wet pond with no outlet is 13.00.

The stormwater runoff is tributary to the Fore River; therefore, **a waiver from the Flooding Standard is requested**. The wet pond is capable of conveying runoff from the 100-year storm without exceeding the elevation of the low point in the existing storm drain system. The existing storm drain outlet will discharge at a stable riprapped location. A trash rack over the outlet control structure will ensure that the outlet pipe will not be clogged. The proposed wet pond has the capacity to store the entire runoff from a 25-year storm without exceeding the low point elevation. Based upon the factors stated, Gorrill Palmer is of the opinion that the project construction will not result in adverse effects to downstream conditions.

12.11 MAINTENANCE OF FACILITIES

The stormwater management facilities will be maintained by the Applicant or their assigns after construction is completed. The general contractor will be responsible for maintenance during construction. The contract documents will require that the contractor designate a person for maintenance of the facilities during construction as required by this application. Long-term operation/maintenance schedules for the facilities are provided in the updated O&M Manual included in Attachment D of this report.

12.12 CONCLUSION

The Stormwater Management Plan for this project is anticipated to mitigate any impacts of development on stormwater runoff rates and to provide treatment of pollutants in the runoff. The majority of the proposed development will be tributary to a closed wet pond with one point of discharge.

Based on the proposed design, the runoff from the proposed development will be captured and conveyed in a manner that will not have an adverse impact to the surrounding stormwater systems or the environment.

APPENDICES

Appendix A – Summary Checklist for Inspection and Maintenance

Appendix B – Inspection Logs

Appendix C – Permits for Project

I. INTRODUCTION

Runoff from developed areas, may contain a number of contaminants especially when emanating from rooftops, paved or lawn areas. This runoff can contain a significant amount of non-point contaminants, which can have an adverse impact on the receiving waters. The installation of wet ponds, many times combined with soil media filters, vegetated buffer strips and other measures can significantly reduce the non-point pollution discharge from the developed area.

The effectiveness of ponds and other components of the system are dependent on their upkeep and maintenance to assure they meet their design function over an extended period of years. It is critical that the stormwater management facilities are inspected on a regularly scheduled basis, and that maintenance is performed on an as needed basis. It must also be recognized that the effectiveness of these facilities, and their maintenance requirements, are related to the stormwater drainage facilities that transport the flow to the ponds or treatment measures. Thus, maintenance should be directed to the total system, not just the ponds.

The purpose of this document is to define in detail the inspection and maintenance requirements deemed necessary to assure that the stormwater management facilities function as intended on a long-term basis for Phase 2 at Mercy Hospital. This Operations and Maintenance Manual is specific to the existing and proposed stormwater measures utilized to execute a successful stormwater management plan. Subsequent sections identify individual maintenance items, give a brief commentary of the function and need of the item, a description of the work required, and a suggested frequency of accomplishment. While the suggested programs and schedules must be adapted to specific projects, the material presented should provide guidance for a successful long-term program.

A. Guidelines Overview

A summary of the individual components of stormwater management facilities for this project has been prepared. The format used in the summary is as follows:

Preface: A general description of what function/benefit the element is intended to provide. This is a short summary and not intended to provide the design basis, which can be found in other sources.

Inspection: This section provides the inspection requirements for the individual component.

Maintenance: The section provides general information on the routine maintenance requirements of this element.

Frequency: This section outlines the best judgment of the designer on the system to the frequency of maintenance.

Comments: This section provides any particular comment on the site-specific features of this element. This is a summary only. The owner/operator should review the design drawings and documents carefully to understand the particular elements of the project. The end of this section should allow the owner/operator to make notes on the specific

program. This may include the selected maintenance procedure, cross-references to applicable design drawings, etc.

A list of the individual inspection/maintenance elements is provided in the table of contents. The guidelines are proposed for initial use with adjustments made as appropriate based upon specific project experience.

This report includes the Operation and Maintenance requirements for any potential BMP identified in the Stormwater Management Report for this project.

B. Responsible Party

The responsible party for operation and maintenance of the stormwater and other site infrastructure will be the applicant or their agents or assigns.

II. PROJECT OVERVIEW

Key permits issued (or applied for) on the project include:

- City of Portland Level III Site Plan Approval
- MaineDEP Amended Site Location of Development Permit
- MaineDEP Tier III Natural Resource Protection Act Permit
- ACOE Section 404 Wetland Permit
- Maine Construction General Permit Stormwater General Permit

A copy of the permits and Stormwater Management Report should be appended to this manual as Appendix C. The Owner/Operator of the stormwater management system should review these permits for a general description and background of the project, as well as any specific permit conditions or requirements of the project.

The applicant has retained Gorrill Palmer for civil engineering for the development project. Gorrill Palmer has prepared the design for the stormwater management facilities and may be contacted at:

Gorrill Palmer
707 Sable Oaks Drive – Suite 30
South Portland, Maine 04106
207.772.2515

The applicable plans and design documents which apply to the project are:

1. Civil Site Plans Prepared by Gorrill Palmer
2. The Erosion Control/Sedimentation Control Plan for the project
3. The Stormwater Management Plan for the project

A copy of these documents should be retained with this manual.

The proposed design includes inlets, stormwater conveyance lines, and a wet pond with an outlet control structure.

The key receiving waters for this project is the Fore River that is located south of the project site.

The manual is intended for general guidance; however, any substituted deviations from the manual should be reviewed with respect to provisions of Appendix C.

III. STANDARD INSPECTION/MAINTENANCE DESCRIPTIONS

The following narratives describe the inspection/maintenance provisions for the Stormwater Management system. These O&M procedures will complement scheduled vacuuming of the parking lots which is anticipated to occur at least twice per year. Proper O&M is necessary to make sure the system will provide its intended purpose of conveying runoff, removing a substantial amount of the suspended solids, and other contaminants in the stormwater runoff. Routine vacuuming of the porous areas is critical to their successful functioning.

A. Stormwater Inlets

Preface: The success of any stormwater facility relies on the ability to intercept stormwater runoff at the design locations. Stormwater inlets include catch basins, open culverts, and field inlets. Inlets exist throughout the Mercy Hospital – Fore River Campus system.

Inspection: The inspection of inlet points will need to be coordinated with other maintenance items, these include:

- Building maintenance areas
- Grounds maintenance

The key elements of the inspection are to assure the inlet entry point is clear of debris and will allow the intended water entry.

Maintenance: The key maintenance is the removal of any blockage which restricts the entry of stormwater to the inlet. The removed material should be taken out of the area of the inlet and placed where it will not reenter the runoff collection system. Snow should be removed from inlets on parking lots. Grass clippings and leaves should be bagged and removed particularly near the yard inlets near the buildings.

Frequency: All inlets should be inspected on a quarterly basis, and after/during significant storm events i.e. >1" rainfall).

Maintenance Personnel: The maintenance personnel will perform the normal maintenance/ inspections of the inlets and tributary drainage system.

Comments: Maintenance of inlets is critical on this project.

B. Tributary Drainage System

Preface: Stormwater from most of the project will be directed through a conveyance (tributary) system which transports the flow to the wet pond and ultimately to the Fore

River. This conveyance system will be principally overland flow discharging to piped drain systems. Most of the sediment carried by the drainage system is intended to be trapped in structures. Maintenance of this system can play a major role in the long-term maintenance costs and the effectiveness of the onsite systems. The primary pretreatment measure for the Mercy Hospital site will be through deep sumped catch basins with hooded outlets.

Inspection: The tributary drainage system should be periodically inspected to assure that it is operating as intended, and that the carrying capacity has not been diminished by accumulations of debris and sediment or other hydraulic impediments. On piped systems, the inlets must be inspected to ensure the rims are set at the proper elevation to optimize flow entry and are not clogged with debris.

The level of sediment in the sumps should be checked to assure their effectiveness. Pipelines connecting the inlets should be checked to determine if siltation is occurring. This will be most critical on drain lines laid at minimal slopes. This can usually be accomplished by a light and mirror procedure.

Maintenance: Maintenance of the storm drainage system must assure that it continues to serve its design function on a long-term basis, and that its operation does not transport excessive sediments to any downstream treatment device or the receiving waters. Elevations on the rim of catch basins should be adjusted as needed to assure optimal water entry. Depending on the frost susceptibility of the soil, the rims may become elevated over time causing flow to circumvent the inlet. If a temporary filter bag has been designated for the inlet during construction, silt or other deleterious materials, can significantly reduce capacity and the bags should be removed with the sediment and replaced during construction. Catch basin cleaning would normally be accomplished with vacuum trucks contracted as a maintenance service for the Development. The removed material must be disposed of at an approved site for such materials.

If sediment in the pipeline is observed, it should be removed. This may be accomplished by hydraulic flushing, or by mechanical means. If hydraulic flushing is used the downstream conditions should be analyzed.

Frequency: The tributary drainage system should be inspected on an annual basis. Adjustment of inlet rim elevations should be on an as needed basis. Cleaning catch basin sumps and pipelines will depend on the rate of accumulation.

F. Vegetation in Pond

Preface: Typically, ponds constructed for stormwater management will have an earthen bottom as is the case for the Mercy Hospital wet pond. Aquatic vegetation will often become established in such ponds. It will be more prevalent in ponds with silty soils and ponds with relatively impermeable liners and less prevalent in granular soils. This vegetation is beneficial as it assists in nutrient removal, provides wildlife habitat, and assists in side slope stability through its root structure.

Proper maintenance is important because, if the vegetation proliferates beyond acceptable levels, it can become a detriment to the pond function. Dying vegetation may

also accumulate on the pond bottom where it will release nutrients back in the water, and may lower oxygen levels. If allowed to accumulate it will lessen pond volumes over time.

Inspection/Monitoring: The extent of aquatic vegetation associated with the wet pond should be monitored. A photographic record of growth may be useful.

Maintenance: Judgment must be used to determine a proper balance between desirable growth levels and excessive growth. This will be gained by experience. If excessive growth is observed it should be cut back and removed on an annual basis.

Removal of excessive growth should be accomplished in the late fall or early winter. When ice forms sufficiently to walk on, the vegetation extending above the ice level should be cut and removed from the pond. The material should be disposed of in accordance with applicable ordinances.

Frequency: Inspect and document aquatic vegetation growth and wildlife use annually in late summer or early fall at the end of the growing season. Cutting and removal of growth will depend on its density. Removal on a 1-to-3 year frequency will be typical. Activity associated with burrowing wildlife, including muskrat and groundhogs must be monitored to avoid holes within the berms that may give way to erosion or water loss.

Removal of Cutting: Cuttings of undesirable excessive vegetation should be removed from the pond areas and composted or otherwise disposed.

Comments: Care should be taken when performing work around and on ice.

H. Sediment Monitoring/Wet Ponds

Preface: It is important to monitor sediment build-up in wet ponds to assure that capacity remains to accomplish its intended water quality function. This is true for both the wet pond at Mercy Hospital.

Inspection: Measuring sediment build-up in a pond with a permanent pool, which cannot be readily dewatered, must rely on recorded differential elevation. In such an installation, it is important to have accurate "As Built" elevations on the pond bottom prior to its being placed in operation. This should be a requirement of the construction contract.

The build-up of sediment requires establishing the elevation of the top of the sediment layer for comparison with original bottom elevations. To accomplish this, a permanent benchmark should be established at the site that is not subject to frost action. The elevation of the water surface at the time of survey can thus be established. Measurement should then be taken from the water surface to the top of the sediment layer. This should be done at sufficient locations to cover the total pond area. It is noted that sediment build-up will be more rapid near the inlet of the pond.

The depth measurements can be taken in the summer utilizing a small boat, or in the winter through the ice. The depth measuring staff should have a flat plate attached to the bottom so it will not sink substantially into the sediment layer.

By comparing the measured elevations with the as-built elevations of the pond bottom it will be possible to compute sediment build-up levels.

Maintenance: If sediment build-up in the pond becomes sufficient to diminish its treatment function it will have to be removed. This may be accomplished by dewatering and removal. If the pond cannot be dewatered, hydraulic dredging should be utilized. When pond sediment removal is planned, record drawings should be reviewed for special linings or other special features, which may influence removal techniques, or may have to concurrently be maintained.

Frequency: The sediment buildup measurements should be accomplished at 5- year intervals. Removal of sediment should be accomplished when it occupies 15% of the effective pond volume.

Options to sediment removal will vary on each project, but could include enlargement of the pond, or qualitative sampling to examine pond performance. If such options are considered, existing permit conditions, as well as current regulations, should be examined where necessary, and permit amendments should be obtained.

Comments: None.

I. Sediment in Forebay

Preface: The wet pond has been constructed with a small forebay sump at the entrance. The purpose of this sump is to collect and detain larger particles in the sediment, which may enter the pond through the inlet pipe. A secondary benefit of the forebay sump is to achieve better hydraulic flow distribution in the main segment of the pond.

Inspection: During periods of lowest water surface in the pond it should be possible to inspect the forebay sump and to measure the sediment accumulation.

Maintenance: If a significant accumulation of sediment is recorded in the sump, it should be removed. Depending on the size of the sump, the amount of sediment collected, and its location, the sediment may be removed manually, by a vacuum truck or other methods. The material removed from the sump should be disposed of in accordance with local practice for disposing of catch basin cleanings.

Frequency: The forebay sump should be inspected semi-annually if possible, preferably in the early summer after spring runoff, and in the fall. The frequency of sump cleaning will depend on the rate of sediment buildup. Cleaning on a 1 to 2 year basis is likely. It is noted that cleaning of the forebay sump will lengthen the time between pond cleanings.

The rate of sediment buildup will depend on the tributary drainage facilities, i.e., faster buildup with open ditch transport systems and buildup from pipe systems with sumped

catch basins. Maintenance practiced for the tributary drainage system will also impact sediment buildups.

Comments: None.

I. Litter

Litter should be removed as a matter of course by workers and as part of the ground's maintenance contract.

IV. PROGRAM ADMINISTRATION

A. General

A reliable administrative structure must be established to assure implementation of the maintenance programs described in the foregoing section. Key factors that must be considered in establishing a responsive administrative structure include:

1. Administrative body must be responsible for long-term operation and maintenance of the facilities. (Maintenance continues for the lifespan of the development in accordance with this document)

2. Administrative body must have the financial resources to accomplish the inspection and maintenance program over the life of the facility.

3. The administrative body must have a responsible administrator to manage the inspection and maintenance programs.

4. The administrative body must have the staff to accomplish the inspection and maintenance programs or must have authority to contract for the required services.

5. The administrative body must have a management information system sufficient to file, retain, and retrieve all inspection and maintenance records associated with the inspection and maintenance programs.

6. A qualified post construction inspector shall be retained by the Owner. His/her duties shall include preparing schedules for the Owner's maintenance, summarizing the results of this maintenance and preparing an annual report on the operation, maintenance, and repair of the stormwater system which must be copied to the City. (The Owner shall be responsible for retaining a separate entity to perform maintenance which cannot be performed by the management of building and property grounds.) This person shall also participate in troubleshooting of the stormwater management system if a problem develops.

If any of the above criteria cannot be met by the entity assigned inspection and maintenance responsibilities, it is likely that the system will fail to meet its water quality objectives at some point during its life. While each of the above criteria may be met by a variety of formats, it is critical to clearly establish the assigned administrative body in a responsible and sustainable manner.

B. Record Keeping

Records of all inspections and maintenance work accomplished must be kept and maintained to document facility operations. These records should be filed and retained for a minimum 5-year time span. The filing system should be capable of ready retrieval of data for periodic reviews by appropriate regulatory bodies. Where possible, copies of such records should also be filed with the designated primary regulatory agency for their review for compliance with permit conditions. Typical inspection and maintenance record forms are attached hereto as Appendix B.

Beyond the initial 5-year time span of the original approval and maintenance plan, the stormwater management system will need to be recertified through the Department every 5 years to confirm that there is conformance with the original permit documents. This process will ensure all systems function properly over time. This document will remain valid throughout any subsequent recertification processes.

C. Contract Services

In some instances, or at specific times, the Maintenance Personnel may not have the staff to conduct the required inspection and/or maintenance programs as outlined in this document. In such cases, the work should be accomplished on a contractual basis with a firm or organization that has the staff and equipment to accomplish the required work.

The service contract for inspection and maintenance should be formal, well written legal document which clearly defines the services to be provided, the contractual conditions that will apply, and detailed payment schedules. Liability insurance should be required in all contracts.

APPENDIX A

Summary Checklist
Inspection and Maintenance

Stormwater Management System Maintenance Program Summary Checklist						
Item	**Commentary**	**Frequency**				
		Monthly	**Quarterly**	**Semi-Annual**	**Annual**	**Long Term**
Stormwater Inlets	Stormwater inlets allow flow entry from a surface swale to a piped system. Entry may or may not be equipped with a bar rack. Inspect entry for debris accumulation. Remove debris to allow unimpeded entry. Lawn clippings and leaves should be removed from yard areas.		X		X Clearing	
Tributary Drainage System	Inspect to assure that the carrying capacity has not been diminished by debris, sediment or other hydraulic impediments.				X	
Vegetation in Pond	Observe extent of vegetation in fall. Cut above ice level in winter – remove.				X	
Sediment Monitoring in Wet Pond	In larger ponds with permanent water body the sediment can be measured by measuring bottom surface elevations and comparing with record elevations of initial construction. Should occur roughly every 5 years. Remove sediment when it occupies 15% of volume (10-15 years)					X
Sediment in Forebay	Observe sediment accumulation in forebay sumps. Remove sediment from sump.				X	
Litter	Litter should be removed daily.					

APPENDIX B

Sample Inspection Logs

MERCY HOSPITAL – FORE RIVER CAMPUS
PORTLAND, MAINE

STORMWATER MANAGEMENT
SAMPLE STORMWATER INSPECTION & MAINTENANCE LOG

This log is intended to accompany the Operation and Maintenance Manual for Stormwater Management and Related Facilities. All stormwater BMPs shall be maintained in effective operating condition. A person with knowledge of erosion and stormwater control, including the standards and conditions of the DEP Stormwater Permit, shall conduct inspections of the facilities as described in the O&M Manual and on this form, and identified deficiencies must be corrected. This log shall be kept on file for a minimum of five (5) years.

A. General Information			
Project Name:		**Inspection Date:**	
Parcel/Lot:		**Current Weather:**	
BMP Owner:		**Date/Amount Last Precip.:**	
Owner Mailing Address:		**Inspection Company:**	
Owner Phone #:		**Inspection Co. Mailing Address:**	
Owner Email:		**Inspector Name:**	
		Inspector Phone #:	
		Inspector Email:	

B. Stormwater Inlets (Catchbasins)	**Observations**
Frequency: Annually in the spring	
Accumulated sediments from inflow channels and pipes between basins have been removed and legally disposed of	☐ Yes ☐ No ☐ NA
Floating debris and large sediment particles have been removed from inlets.	☐ Yes ☐ No ☐ NA
Stormwater Inlet Notes:	

C. Tributary Drainage System	**Observations**
Frequency: Annually spring or late fall and after heavy rains	
Remove and legally dispose of sediments	☐ Yes ☐ No ☐ NA
Remove floatables and other objects	☐ Yes ☐ No ☐ NA
Check for overgrown vegetation impeding flow	☐ Yes ☐ No ☐ NA
Check pipelines for siltation and clogging	☐ Yes ☐ No ☐ NA
Repair any slumping side slopes or erosion	☐ Yes ☐ No ☐ NA
Replace any riprap on areas where any underlying fabric or underlying gravel is exposed.	☐ Yes ☐ No ☐ NA
Tributary Drainage System Notes:	

G. Vegetation in Pond	Observations
Frequency: Biannually spring and late fall and following heavy rains	
Check for excessive growth of vegetation that could decrease pond volume over time. Do this in late summer early/fall after growing season	☐ Yes ☐ No ☐ NA
Check for signs of wildlife burrowing into berms that could cause failure of pond structure	☐ Yes ☐ No ☐ NA
Vegetation in Pond Notes:	

H. Sediment Watering in Wet Pond	Observations
Frequency: Longterm (5-10 years)	
Clean basin of debris, sediment and hydrocarbons from pretreatment structure	☐ Yes ☐ No ☐ NA
If mowing is desired, use handheld trimmers or push mowers.	☐ Yes ☐ No ☐ NA
Inspect inlets and outlets of obstructions and remove	☐ Yes ☐ No ☐ NA
Inspect slopes for erosions or destabilization; repair as required	☐ Yes ☐ No ☐ NA
Till, Seed and mulch basin if vegetation is sparse	☐ Yes ☐ No ☐ NA
Replace top several inches of soul filter material if water is ponding more than 72 hours	☐ Yes ☐ No ☐ NA
Sediment Watering in Wetpond Notes:	

I. Sediment in Forebay	Observations
Frequency: Annually	
Check for sediment buildup in sump	☐ Yes ☐ No ☐ NA
Check for other debris and large sediment particles in sump	☐ Yes ☐ No ☐ NA
Remove sediment and dispose of properly	☐ Yes ☐ No ☐ NA
Sediment in Forebay Notes:	

APPENDIX C

Permits for Project

(To be Added at a Subsequent Time)

SITE DESIGN

The following statements are provided in accordance with the submission and Section 14-526 of the ordinance.

(d) Site Design Standards.

Massing, Ventilations and Wind Impact (14-526 (d) 1)

- *Wind and ventilation impacts on adjoining structures and/or adjacent public spaces. Wind study, if applicable.*
- *Bulk, location or height impacts on adjoining structures*
- *Identify and locate HVAC equipment and venting away from public spaces and residential properties*
- *Identify screening and manufacturing specifications for noise, if applicable*

1. *Massing, Ventilation and Wind Impact:*

   a. The project proposes construction of a new multi-story ASC building and hospital expansion. The project will not result in any significant changes to the wind environment proximate to the site. There are no abutting structures or uses that might be impacted by the proposed buildings, as the site is somewhat isolated from nearby neighborhoods.

   b. The project will not result in any significant impacts to abutting properties and is consistent with the contract zone and other zoning/city standard considerations. The proposed expansion and ASC will be considerably less in scale when compared to the MMC Parking Garage under construction on the opposite side of the rail tracks to the east of the site.

   c. HVAC venting, if necessary, will be directed through building roof top mounted units and will not impact any adjacent public spaces or residential properties

Shadows (14-526 (d) 2), if applicable

- Shadow analysis of impacts on publicly accessible open space (Technical Manual, Section 11)

2. *Shadows:*

   a. The buildings at the site will not cast significant shadows onto neighboring properties, or block access to direct sunlight for structures utilizing solar energy. The Site Layout Plan and Grading and Drainage Plan show the proposed site improvements and their relationships to property lines. The grading plan shows the relative elevations of the building with respect to elevations along the property lines.

Snow and Ice Loading (14-526 (d) 3)

- *Building design to prevent snow and ice from loading or falling onto adjacent properties or public ways.*

3. Snow and Ice Loading:

a. The buildings has been designed and located such that accumulated snow and ice will not fall onto adjacent properties or public ways. Snow will be removed from the parking lots and stockpiled in the snow dump at the south end of the site.

View Corridors (14-526 (d) 4), if applicable

- *Protection of designated view corridors (Portland Design Manual, Appendix 1)*

4. View Corridors:

a. The project entails construction of a two-story ASC building and four level hospital expansion at the site in manner that is compliant with the Mercy Hospital Contract Zone. The site is considered exemplary for its public view from I-295 and the Veteran's Bridge. The site does not block views from nearby properties. The site is not located within any corridors identified in the Downtown Vision View Corridor Protection Plan. The MMC parking garage construction will introduce a larger building to the background of the Mercy campus, thus detracting from the Mercy visual character to a certain extent.

Historic Resources (14-526 (d) 5), if applicable

- *Identify developments within Historic Districts or affecting Designated Landmarks*
- *Certificate of Appropriateness or other evidence*
- *Identify Developments within 100 feet of Historic Districts or affecting Designated Landmarks. Advisory HP review may be required*
- *Address preservation and documentation of Archaeological Resources*

5. Historic Resources:

a. The development is not located in a historic district, historic landscape district or City designated landmark.

b. The development is not located adjacent to or within 100 feet of a designated landmark, historic district, or historic landscape district.

c. There are no known remaining archaeological resources on the site. The Fore River Parkway was constructed in the areas previously occupied by the Cumberland and Oxford Canal as well as historical rail tracks.

Exterior Lighting (14-526 (d) 6)

- *Cut sheets of on-site light fixtures and any architectural or specialty lights (Technical Manual, Section 12)*
- *Engineered details for any lights proposed in street right-of-way (Technical Manual, Section 10)*

6. Exterior Lighting:

a. Site Lighting

(i) All new exterior lighting at the site will be full cutoff with no light emitted above the horizontal plane, and in accordance with Section 12 of the Technical Manual. A

photometric Lighting Plan is being prepared to demonstrate illumination levels throughout the site will be consistent with City Standards. The plan will be uploaded for review when complete.

b. Architectural and Specialty Lighting

(i) Not applicable to the project.

c. Street Lighting

(i) There are existing area lights along drives within the Campus area. There are no new street lights proposed for the Fore River Parkway.

Noise and Vibration (14-526 (d) 7)

- *Evidence of noise levels for equipment, such as equipment specifications, to demonstrate consistency with zoning requirements*

7. Noise and Vibration:

All heating, ventilation, air conditioning equipment including air handlers and generators are designed to meet local, state, and federal emissions and noise requirements. Most of the HVAC equipment is mounted in the middle of the roofs to minimize visibility. The addition expands the current hospital toward the middle of the site and the new ASC building is also located in the middle of the site. There are no residences with direct views of either roof. The ground mounted equipment for the new ASC will be screened. Any additional ground mounted equipment for the Hospital will be located in the existing screened service yard. Equipment cut sheets can be provided upon request.

Signage and Wayfinding (14-526 (d) 8), if applicable

- *Signage plan showing the location, dimensions, height and setback of all existing and proposed signs. Signs in Historic Districts are reviewed by Historic Preservation staff*
- *Proposed commercial and directional signage on site*

8. Signage and Wayfinding:

a. All street and wayfinding signage shall meet the requirements of the Manual on Uniform Traffic Devices (MUTCD) and Division 22 of the City Code.

(i) The project is not located in a historic district or subject to Article IX.

(ii) Proposed wayfinding signage is identified in the Wayfinding and circulation plan. In addition, Mercy has recently submitted a sign permit application for separate review by the Code Enforcement office. The sign package includes removal and replacement of many of the onsite signs as part of a rebranding of the campus related to the Northern Light Health/Mercy affiliation.

(iii) All street and wayfinding signage shall meet the requirements of the Manual on Uniform Traffic Devices (MUTCD) and Division 22 of the City Code.

Zone Related Design Standards (14-526 (d) 9)

- Address Historic Preservation Design Review, if applicable
- Address any applicable design review standards by zone
- Address submission requirements from Design Manual, page 1, addressing neighborhood context
- Description of exterior materials, color, finish, and samples

9. Zoning Related Design Standards:

The following excerpt of the Contract Zone Agreement Paragraph 10 (g.) outlines the architectural standards pertaining to the site:

"**g**. **Architectural design***: All buildings shall be designed or approved by a registered architect in the State of Maine. The scale, texture, color, and massing of the buildings shall be coordinated. The full range of high-quality, permanent, and traditional or contemporary building materials and technology may be incorporated in a manner so that the development as a whole embodies distinguishing attributes that achieve the developer's desired degree of excellence and are in conformance with the architectural guidelines provided in any private development restrictions. Particular emphasis shall be placed on the appearance of building facades from public streets and highways including the* **CONNECTOR***, from driveway and parking areas, and from other nearby buildings. Building elevation drawings shall be submitted which indicate architectural style, exterior finishes and color, building height and scale, and location and scale of window and door openings. Samples of exterior building materials shall also be submitted."*

Architectural Comments:

The architectural design intent for the Hospital Addition is to complement the existing Phase 1 portion so that when viewed in its entirety it presents one unified composition.

The existing Phase 1 building is essentially a 5-story tall rectangle that steps back on the east and west sides as the building gets higher. The 4-story addition extends the rectangle toward the north and steps back along the west. The Addition also steps back along the longitudinal axis as well with the third floor being half the length of the second.

The new Addition will be clad with the same brick and cast stone components used in Phase 1. The language of the fenestration and cast stone banding draws from the existing using the punched windows with the vertical band from Level 2 as the inspiration. The arcade extends with the same aesthetic for an additional two bays toward the new entrance on the west side.

In order to best address wayfinding needs and to minimize confusion for patients and visitors, the new entry canopies on the north and west purposefully look different from the main, drive-under Harry Davis entrance. The new entrances are only meant to cover a passenger exiting a car so the glass panels are suspended from the wall above.

The Ambulatory Surgery Center (ASC) is a 2-story free standing building that sits to the east of the hospital addition in board from the Parkway. At this point on the site, the first floor of the ASC is at the same level as the ground floor of the Hospital. The ASC will be positioned approximately

Similar to the other buildings on the campus, the ASC is clad in brick with glass storefront with spandrel panels. Taking cues from the existing Medical Office Building, the glass over the front entrance has an arched pattern – which also reflects back to the windows on the fourth floor of the Hospital. The front canopy is glass similar to the canopies on the north and west of the Addition. The rear canopy is much simpler in part due to its utilitarian function but also because it faces the rear of the Hospital, which has a similar simple canopy.

Architectural renderings are included with this section.

Public Safety & Fire Prevention: "A narrative regarding building code compliance etc addressing the items in 14-526 (c) below"
All three projects (the new Addition, the MOB renovations and the new ASC) will comply with the appropriate edition of MUBEC, IBC, NFPA and ADA. There is a life safety/code compliance drawing in each document set that identifies each code and year along with specific pertinent requirements.

I assume GP has the sentence about emergency vehicular access

Massing, Ventilation, Wind Impact: "A narrative from SMRT to explain the basis of design for both the Expansion and the ASC would be helpful with info we can incorporate into the narrative to address the sections below."

The architectural design intent for the Hospital Addition is to complement the existing Phase 1 portion so that when viewed in its entirety it presents one unified composition.

The existing Phase 1 building is essentially a 5-story tall rectangle that steps back on the east and west sides as the building gets higher. The 4-story addition extends the rectangle toward the north and steps back along the west. The Addition also steps back along the longitudinal axis as well with the third floor being half the length of the second.

The new Addition will be clad with the same brick and cast stone components used in Phase 1. The language of the fenestration and cast stone banding draws from the existing using the punched windows with the vertical band from level 2 as the inspiration. The arcade extends with the same aesthetic for an additional two bays toward the new entrance on the west side.

In order to best address wayfinding needs and to minimize confusion for patients and visitors, the new entry canopies on the north and west purposefully look different from the main, drive-under Harry Davis entrance. The new entrances are only meant to cover a passenger exiting a car so the glass panels are suspended from the wall above.

The Ambulatory Surgery Center (ASC) is a 2-story free standing building that sits to the east of the hospital addition in board from the Parkway. At this point on the site, the first floor of the ASC is at the same level as the ground floor of the Hospital.

Similar to the other buildings on the campus, the ASC is clad in brick with glass storefront with spandrel panels. Taking cues from the existing Medical Office Building, the glass over the front entrance has an arched pattern –

which also reflects back to the windows on the fourth floor of the Hospital. The front canopy is glass similar to the canopies on the north and west of the Addition. The rear canopy is much simpler in part due to its utilitarian function but also because it faces the rear of the Hospital, which has a similar simple canopy.

Noise & Vibration: "See 14-526 (d) 7 below"

All heating, ventilation, air conditioning equipment including air handlers and generators are designed to meet state and federal emissions requirements. Most of the HVAC equipment is mounted in the middle of the roofs to minimize visibility. The addition expands the current hospital toward the middle of the site and the new ASC building is also located in the middle of the site. There are no residences with direct views of either roof. The ground mounted equipment for the new ASC will be screened. Any additional ground mounted equipment for the Hospital will be located in the existing screened service yard.

Zone related design standards: "Narrative describing how the Contract zone is satisfied"
Re item 10g Architectural Design of the Contract Zone Agreement

The architectural design intent described above supports the guidelines regarding scale, texture, color and massing to achieve an aesthetically pleasing and cohesive campus. The new ASC building also enhances the view of the campus from the Parkway.

NORTHERN LIGHT MERCY HOSPITAL
FORE RIVER CAMPUS
LEVEL III SITE PLAN APPLICATION
CONTRACT ZONE COMPLIANCE

Prepared for:

Northern Light℠
Mercy Hospital

175 Fore River Parkway
Portland, Maine 04101

Prepared by:

Gorrill Palmer Consulting Engineers
707 Sable Oaks Drive
South Portland, Maine 04106
(207) 772-2515

February 2020

The following is an analysis of the Site Plan Application for Phase II of Mercy Hospital's development of the Fore River campus, as it relates to the additional development standards contained in the December 3, 2001 Contract Zone Agreement with the City of Portland. As demonstrated below, the proposed development meets all of the standards.

I. DEVELOPMENT STANDARDS

A. Design Relationship to Site

Development proposals shall demonstrate a reasonably unified design of the site in a Campus-like setting, including the architecture, the layout of the buildings, pedestrian and vehicular circulation plan, open space, drainage, and the topography, soil conditions, vegetation, and other natural features of the site. Integration of open spaces and natural features shall be achieved by incorporation of outdoor amenities for the benefit of users of the site, such as jogging and walking trails, gardens, and benches. The proposed layout of buildings and uses shall demonstrate compatibility within the site. Consideration shall be given to compatibility of proposed perimeter development with the existing and future uses adjacent to the property. The existing north and south open space areas provide over 4 acres of undeveloped waterfront for the use and enjoyment of site users as well as the general public.

1. Building Orientation

The development layout is governed by the following site conditions:

- Location of the driveway access locations along the Fore River Parkway. These are fixed due to geometric and sight line requirements.
- Naturally high ground within the northern sections of the site.
- Natural building envelopes available within the north and south sections. Neither area is large enough by itself to support the full Campus program, therefore requiring a "bridge" between them. Mercy sought and was granted approvals by the MaineDEP and USACOE for the filling of the pond in the middle of the site which allows for the Phase 2 plan for the Ambulatory Surgery Center ("ASC") and next phase support programming. Future phases will build upon the availability of development area provided by the pond filling.
- The building envelopes allow for the following key elements:
    - Building connectivity for the Phase 1 Medical Office Building and Expanded Hospital.
    - Adequacy of Phase 1 and Phase 2 surface parking within reasonable proximity to each building's entrance.
    - Future accessibility to surface and structured parking proximate to the Hospital, the expansion, and existing and future Hospital Facility outpatient Building(s).
    - The hospital's prominence on the higher elevation of the site provides for clarity of view from the nearby roadways and over the Fore River Parkway to the Fore River.
    - Allows capacity for building expansion.
    - Ample utilities capacity on the Campus.
    - Open spaces for patients, staff, and the general public to take advantage of the site's waterfront conditions and aesthetics.

- Continued connectivity to various pedestrian access routes including the Fore River Parkway Trail and other Portland Trails systems, METRO bus services, Veterans Bridge and Portland Transportation Terminal.
- A designated vehicular access route from the northerly driveway to the southerly driveway and ideal connectivity to the nearby regional highway system including I-295, US Route 1 and Maine Turnpike.

B. ***Landscaping***

Future development proposals shall include a landscape program. All land areas not covered by structures, parking areas, or circulation facilities shall be landscaped and maintained to supplement the existing site landscaping. In order to soften the visual impact of large expanses of pavement in parking lots, vegetation shall be planted or retained in islands or planting strips where required by Article IV (Subdivisions) and Article V (Site plan) of the Land Use Code.

The current surface parking areas contain significant tree planting and vegetative plantings for screening and general aesthetics.

Please see Schematic Figure 4.

1. Design Intent

   Mercy Hospital looks to "heal" the development site through its approved soil management plan and landscaping program. The cleanup and coverage of exposed soils and disturbed areas has been accomplished in a manner that beautifies the site and builds upon its waterfront location.

   The project's landscaping program has been installed to meet the City's Arboricultural Specifications and Standards of Practice and Landscape Guidelines. The site contains trees and landscaping species that are suitable for the property's environmental conditions. All materials are of appropriate hardiness, are suitable to the site's soils conditions and generally complement existing landscaping in the surrounding areas, including the Fore River Parkway and Veterans Bridge. All areas not otherwise used for buildings, paved parking areas, landscaping or otherwise naturally vegetated have been covered with topsoil and grassed.

   Mercy intends to construct a permanent wetpond within the southwest corner of the former gravel pit, as part of the Phase 2 Hospital expansion. The wetpond will be preserved in perpetuity to function as both a stormwater management measure and also a recreational amenity. Enhancements to the wetpond perimeter will include naturalized vegetation and a walking path/boardwalk for access to the pond edges.

2. Planting Design

   Plantings utilized throughout the site have been maintained to fulfill the functions listed below. Plant types used vary in type and size, some being native, and are placed to take full advantage of individual plant characteristics, such as form, mature size, and seasonal interest.

   - Highlight and accent building entrances and specialty areas; gardens, terraces, etc.
   - Define major entry, intersection, and focal points.

- Soften and screen the visual impact of parking and service/utilitarian areas from views within and from outside the site.
- Help define areas and travel sequences within the site to aid in identification of circulation patterns and wayfinding.
- Provide an aesthetically pleasing environment for patients, staff, and visitors.

This is accomplished by means of the following:

- Establish a hierarchical planting structure defining major site components.
- Used Green Ash to line and identify the primary site circulation loop from the north entry, around the pond, to the south entry, and along the eastern drive to the south end of the site (access from Connector eastbound).
- Used Ginkgo and Red Maple to line and identify secondary circulation drives adjoining the hospital and through the southern parking area.
- Used single species in individual parking "cells" or blocks, to define and create identity for each, much like a color-coding for each sub lot. Species include European Hornbeam, Chinese Elm, and Ornamental Pear.
- Used flowering accent trees such as Crabapple, Ornamental Pear, and Serviceberry, to highlight primary intersections and points of emphasis.
- Utilize a mix of deciduous and evergreen species around the site perimeter to screen parking areas, and integrate the site into the background of mixed-species vegetation at the base of the Western Promenade. Evergreens are used on the slope between the Fore River Parkway and north parking, which screen views of the north parking areas, augmenting the street trees planted in the Parkway Right-of-way. The eastern side of the site at the property line is planted in a mix of deciduous and evergreen trees. The planting on the berm on the east side of the south parking is augmented with shrubs. Mixed planting is shown at the northwest corner to soften views to the northern parking from those southbound on the Connector, reinforcing the natural screening by existing vegetation and lower position of the parking in the landscape.

- Existing vegetation has been preserved to the greatest extent practicable, and is incorporated into the overall plan as a screening and naturalizing element.

3. Open Space Design

Though constituting what essentially amounts to "leftovers" from the Fore River Parkway and Veterans Bridge road projects, the open spaces at the north and south ends of the project area adjacent to the Fore River represent an excellent opportunity for recreation resources. Character-defining elements of the area include:

- Close proximity to the water's edge, with a few limited opportunities for shoreline access.
- Expansive views to the Fore River north of the Veteran's Bridge.
- Access potential from an established pedestrian system (Portland Trail network).
- Remnants of past uses including wharves, rail lines and access ways that speak to Portland's industrial "working waterfront" heritage.
- New, state-of-the-art stormwater treatment swales that reflect the latest environmental thinking in run-off water quality, the form of which includes long, geometric, swales and berms in the landscape.
- Large open areas of essentially flat land in varying degrees of natural succession vegetation re-establishment.
- Somewhat secluded from view, and the sometimes haunt of Portland's transient population, raising questions of security.

Taken together, these elements offer an opportunity for the creation of passive-oriented recreation areas with interpretive potential. This is achieved by:

- Utilizing and integrating the regular geometry of the stormwater swales and berms into the open space design. The swales are reminiscent of the Cumberland & Oxford Canal system that used to terminate in the nearby turning basin. The linear arrangement is incorporated into the composition as a foil for a bosque of trees, across which pathways with footbridges are located to draw the user into the area. Interpretive signage could be installed at some future date to provide information about the treatment system and water quality issues, as well as nearby canal history.

- At the north end, the remains of a railroad spur to the former wharves organize the alignment of a path between it and the water's edge. Volunteer tree growth, primarily birches, in and amongst the tracks, creates a unique "decomposition" of an industrial area back to the natural. Old internal access drives are geometrically incorporated with allée of trees, with a sitting area with benches focused on the water at their confluence.
- Opportunities are created along stone dust pathways for bench seating and viewing of the water.
- Disturbed areas not otherwise treated are given back to a naturalized field state, or, where active recreation activities (Frisbee, kite flying, etc.) are possible, mown lawn.

4. <u>Phasing</u>

Phase 1 planting and open space improvements included:

- Plantings in the north and south parking areas.
- Plantings at the north and south site entrances.

- Perimeter screen/buffer plantings.
- Plantings around Phase 1 hospital and medical office buildings.
- Screen plantings around service/loading area.
- "Structural" planting in the green space south of the hospital building between the access drive and Connector to include trees and lawns only.
- Full development of north open space including stone dust paths, footbridges, benches, and plantings. The path will be constructed to a point at the northernmost property line where it will be met by pending Portland Trails construction. Trail directional signage will be installed in coordination with Portland Trails.
- Partial development of the south open space to include a portion of planned shade tree planting, general cleanup, and grassing of disturbed and un-revegetated areas.

Phase 2 planting and open space improvements will include:

- Plantings in the expanded parking area.
- Plantings around the new wetpond
- Plantings along the Fore River Parkway to replace the original plantings that have been removed over time.
- Plantings at the Phase 2 hospital building expansion.

5. Wind Buffering

In addition to the front yard buffer areas, the parking areas contain landscaped longitudinal barrier islands at regular intervals. Tree plantings and other landscape measures are positioned to provide winter wind buffering of the building's front entrances and provide protection in the wide-open spaces.

6. General Site Character/Construction Materials

- *Parking Lot Surfaces*

  Parking lot surfaces are hot bituminous asphalt. Standard or pervious concrete may be used in service areas.

- *Walkways*

  Walks within reasonable proximity to the building are reinforced concrete. More remote walks consist of hot bituminous asphalt. Several pedestrian paths to open spaces and around the open marsh in the middle of the site may be bituminous asphalt or stone dust. Several boardwalks will be included for traversing near/over wet areas.

- *Curbs/Islands*

  Curbs are vertical or sloped granite. Landscaped islands are sloped or vertical granite.

- *Walls*

  Site retaining walls, where necessary, are segmented block retaining walls. Decorative walls at the main entrances have a masonry or poured concrete core and stone veneer (granite or limestone) constructed on an appropriate foundation. Retaining walls as an

extension of the building façade shall be poured concrete with a veneer of material to complement the building materials.

- *Fencing*

  Chain link fencing has been placed along the railroad ROW to provide separation and site security. Vinyl coating shall be used where appropriate.

C. *Pedestrian Orientation*

Development proposals shall include an integrated pedestrian circulation system, including internal sidewalks, to take advantage of the topography and natural features of the site. They shall provide for safe pedestrian access to all buildings and parking areas and conveniently access all developed portions of the site without additional driving. The pedestrian circulation system shall link with the shoreline trail feature of the site.

Currently there are over 4,000 LF of paved and maintained sidewalks throughout the Campus. Mercy maintains these routes year-round for staff, patient, and visitor use. The Phase 2 plans include maintenance of the majority of these sidewalks and some new sidewalk and pathways with the limits of work for the ASC and parking areas within the gravel pit area.

Pedestrian sidewalks link the Portland Trails network along the waterfront to each primary site entrance and to the site's internal sections. A pedestrian crossing signal has been installed on the Fore River Parkway at the southerly driveway. Pedestrian linkages include overlooks of the Fore River and also connectivity to the north open space. A paved sidewalk follows the rear access drive around the outside site perimeter; a pedestrian can walk over 4,000 LF (0.75 mile) along onsite paved sidewalk systems in a closed loop, without having to leave the Campus. Pedestrian crossings on the Parkway connect pedestrians to many more miles of available trail within the greater neighborhood and beyond, thus making the Fore River Campus one of the more accessible and walkable sites on the Peninsula.

The north open space area, constructed during Phase 1 includes pathways that enable completion of the linkage between the Thompson's Point area to the already paved and in-place Parkway sidewalk/trail system.

Site-related pedestrian circulation also includes designated sidewalk routes from the surface parking areas to the buildings. A hard surface, landscaped pedestrian sidewalk connects the southerly staff parking area to the staff entrance at the south end of the hospital. A shuttle van also transports hospital staff from the employee parking lots to the hospital entrance on a regular basis. Appropriate signage is provided to aid in the understanding of onsite and offsite pedestrian facilities.

Mercy has actively worked with nearby landowners including the Thompsons Point by allowing weekend event parking that benefits from the site's connectivity to the Fore River Parkway Trail, allowing patrons a very short 8-15 minute walk to events at the Point.

D. Vehicular Access and Circulation

The primary access to serve the entire development will be from two access points and a slip lane from the Connector as may be further developed or modified by joint agreement of the City, MDOT and the applicant. Vehicular circulation through internal driveways and roadways will provide safe an orderly access to all developed portions of the site.

The Maine Department of Transportation used a significant portion of the property for the construction of the I-295/Commercial Street Connector aka fore River Parkway. The connector roadway provides the link between Outer Congress Street, I-295, the Veterans Bridge and the Commercial Street Corridor. From west to east, the connector extends from the I-295 Exit 5 interchange and crosses the Pan Am railroad tracks above grade and proceeds across the property generally along the Fore River frontage. The Veterans Bridge Interchange has been reconstructed with expansive pedestrian facilities for walkers, runners, and bicyclist between Portland and South Portland. The connector right of way includes the Fore River Parkway pedestrian walkway/bikeway along the Fore River frontage. Two separate access drives to the hospital Campus have been provided off the Parkway with the southerly driveway being signalized. Additional gated emergency access is provided off an existing access route behind the County Correctional Facility. These access conditions will likely remain unchanged into the future due to design consideration along the Parkway. A traffic analysis of predicted operating conditions at the driveways upon completion of the Phase 2 project indicates a high level of service will be maintained at both side driveways. Overall, the Fore River Parkway is considered to be an under-utilized transportation corridor in the city, while the city has made efforts to even further improve conditions in the Libbytown area, north of the Mercy Campus[1].

1. Parking

   A parking demand and supply analysis was conducted by Gorrill Palmer Consulting Engineers in support of the Phase II development activity and the findings of that study support the proposed parking supply of 857 spaces. Future development activity will rely on updated parking demand analysis to further inform decision making for surface or structured parking expansion on the property.

   Overall Assessment of Need

   Currently the Phase 1 development contains the following parking:

		Fore River Site Parking Phase 1	
Phase 1 Use	**Building Size**	**Required by Code**	**Currently Available**
Hospital – 1 SP/500 SF	137,832 SF	276	
MOB – 1 SP/400 SF	82,186 SF	205	
Total		**481**	**762**

[1] See *Libbytown Traffic Circulation and Streetscape Study,* by DuBois & King Inc. 2012

Assuming similar ratios are allocated for Phase 2, the expected parking demand at the Fore River site can be summarized as follows:

		Fore River Site Parking Phase 2	
Phase 2	**Building Size**	**Required by Code**	**Provided on Site**
Hospital Expansion – 1 SP/500 SF	54,889 SF	110	
ASC – 1 SP/400 SF	34,987 SF	88	
Subtotal		198	
Plus Existing		481	
Grand Total		**679**	**857**

2. Access and Circulation

   Please see Schematic Figures 2 and 3.

3. Major Entrances and Exits

   - Northerly Driveway – Unsignalized
     - Southbound left and northbound right turn entering
     - Exiting right only to Fore River Parkway northbound
   - Southerly Driveway – Signalized
     - Northbound right turn entering
     - Southbound left turning entering
     - Exiting left turn to Veterans Bridge and West Commercial Street and right turn to I-295 and Congress Street

4. Secondary Access

   Gate controlled emergency access is provided from the existing at-grade crossing behind the Cumberland County Correctional Facility.

5. Internal Site Circulation

   Designated access drive connections are provided between the north and south driveways. Wayfinding measures including signage is provided to direct travelers to the appropriate driveways for north and south access from the site. Landscaping and lighting selection provide distinction from adjacent parking and interior circulation and pedestrian areas.

6. Bus Routes

   METRO currently serves the site from their Congress Street route that involves bus travel from the Parkway and northbound to Congress Street. There is an existing bus shelter located adjacent the Medical Office building. In the future, METRO has expressed a planning goal to update their service routes along the Parkway to provide service in both directions. METRO is also seeking to discontinue the onsite service path and to replace it with possibly two or three new bus stops along the Parkway, one each at the south driveway intersection and at the north driveway intersection. METRO is also contemplating a new stop on the southbound leg of the Parkway. Mercy will continue to work closely with METRO on this planning as these route updates are likely to improve overall METRO service and also

continue to provide key service to all onsite programming including the Hospital, Medical office building and the ASC.

7. Alternative Transportation/Travel Demand Management Plan

The development operations will be conducted in a manner to promote transportation demand alternatives to the extent practicable, given the use and inherent conditions associated patient services, staff work hours[2] and overall hospital Campus visitation. A fundamental result of the relocation of Mercy programming from the State Street facility to the Fore River Campus will be less traffic resulting from Mercy State Street operations. This action alone will result in shifting long standing Mercy traffic from the Portland Peninsula interior and specifically State and High Streets, to the Fore River Parkway and its direct connectivity to the regional highway system. The State Street neighborhood will dramatically benefit from decreased emergency services traffic and overall parking demand along neighborhood streets. Further, the Phase 2 development will not result in increased traffic pressure on the Peninsula as a whole, since Mercy has always been a valued existing land use. Simply, the move results in an improvement for Mercy generated traffic as it utilizes the direct highway connectivity and ample capacity of these highways and the Fore River Parkway.

In addition, Mercy continues to promote the shifting of various operational and administrative functions to their outpatient facilities in surrounding Portland Communities and/or work from home telecommuting opportunities, thus resulting in decreased traffic overall to the Portland Peninsula.

Ultimately, Mercy's TDM will include strategies that encourage employees to use alternatives to driving to work unaccompanied. For example, employees participating in a ride share program currently benefit from designated spaces at the northwest parking lot, nearest the MOB and thus do not need to park in the south parking lot[3]. This will enable Mercy and other tenants to successfully provide parking to all employees, visitors, patients, and physicians in the designed parking plan. Mercy also maintains bike racks at the front of the hospital and near the staff entrance at the south end of the hospital building. Bicycle riding staff have the availability of staff locker room facilities for changing and showering. Mercy routinely provides Taxi vouchers to patients on an as needed basis and they have promoted bus pass programs in the past. An updated Transportation Demand Management Plan is currently underway and will be shared as it becomes available.

E. Buffers and Screens

Development proposals shall include appropriate measures of a dense and continuous nature to supplement existing buffering to parking lot visibility from public roads.

Buffer plantings to provide wind buffering and reduce off-site noise shall be incorporated where feasible. Since the Phase 1 development in 2008, Mercy has maintained a robust planting plan across the Campus and many of the trees have become well established and are providing

[2] Acute care hospital settings and workforce hours are characterized by shift work, per diem staff, and irregular patient load, thus contributing to challenges of a traditional TDM plan.

[3] There are approximately 12 designated spaces for ride share vehicles to park closer to the MOB/Hospital than the south parking lot.

excellent screening and aesthetic impact to the site overall. The Phase 2 development program includes expansion of the hospital within an existing parking lot and placement of the new ASC within the gravel pit. Much of the existing buffering to the ASC location will remain unchanged from current conditions, thus reducing the visual impact the new buildings may have on the site.

F. Preservation of Natural Features

Development proposals shall identify the extent to which the developer will preserve natural features including, but not limited to, existing vegetation, flood plains, rock outcroppings, surface water bodies, drainage swales and courses, and wetlands, provided *any such program shall consider and be sensitive to the need to preserve such natural features.*

See landscaping section above. Public open space has been provided at each end of the property's water frontage, as well as around the new wet pond. During the first development phase, the open spaces offered passive recreational opportunity. The northerly open space is connected to the Portland Trails network by a stone dust path extension. The primary purpose of these spaces is to allow waterfront access. Portland Trails also holds a recreational trail easement over the pedestrian and bicycle paths on the property. Except for one section of gravel path near the existing pond, all pedestrian and bicycle paths will remain.

The property contains a 3.49-acre artificial pond and associated wetlands that had formed in an abandoned gravel pit. The abandoned pit area was substantial cleaned up during the initial 2006 Phase 1 construction period, at which time a significant amount of solid waste including tires, old appliances, furniture and the remnants of a multitude of homeless encampments was removed from the site and some vegetative embankment stabilization was performed. The wetlands are not depicted on the Shoreland Zoning Map. The proposed development will include filling in the existing pond and building a half-acre wet pond in same location. The wetpond will become a permanent measure on the campus that will be protected in perpetuity by a conservation easement. Pursuant to the dimensional standards in the CZA, the maximum amount of impervious coverage permitted on the site is 80%. The proposed project will result in lot coverage of 66%. In 2013, Mercy Hospital obtained permits from the Maine Department of Environmental Protection and the US Army Corps of Engineers to fill in the pond.[4] (see attached permits). In its application, Mercy Hospital provided an alternatives analysis that explains how the campus expansion design evolved to having to fill in the pond. The initial alternatives focused on site selection for all hospital facilities. Campus consolidation is a preferred alternative to a dual campus system for a multitude of reasons, including bringing the hospital up to appropriate standards of care, efficiency and safety, as well as being more cost effective. Mercy Hospital analyzed five alternative site layouts for the expansion and ultimately was approved for a design that included filling the pond.

The proposed site layout, which requires filling the pond, is essential for several reasons. Mercy Hospital's goal is to provide patient care in the most appropriate location for optimum experience and accessibility. The intent is not to overbuild a costly acute care hospital, but rather, create settings to which care is most appropriately provided – our Ambulatory Surgery Center and Medical Office Building – affording convenience for patients and providers as well as adjacencies to support services as required. The ASC is not connected to the hospital because

[4] The permit obtained from the MaineDEP is for a project that is larger than the current phased development presented to the City for permitting.

a separate building meets the goal of providing outpatient services in an appropriate outpatient setting, discreet from Mercy's acute hospital services. In addition, ambulatory surgical services are expected to continue to be a significant part of Mercy's healthcare offerings, with potential for growth which would be compromised if the ASC programming were located in the hospital or otherwise not well positioned on the site. The proposed location allows for future expansion of the ASC building. The site layout was also carefully designed to utilize the rear access road as the central utility corridor and to serve back-of-house functions. All onsite utilities are located either behind the existing hospital or within the east side access drive. There are no utilities (water, sewer, power, gas, comm.) along the Fore River Parkway frontage or front half of the site. The hospital expansion is displacing 100+ physician parking spaces which need to be relocated to a location that provides easy access to the hospital and to the ASC. The parking lots on the MOB side of the hospital will be designated for patients & visitors to the MOB & Hospital as those lots are situated at the front of the hospital building. The new physician parking relocated to the east of the hospital provides for direct access into the staff entrances at the hospital, and to the ASC. Finally, the ASC back-of-house functions are backed up to the central utility/service corridor that exists today for the hospital. Functions that will be provided to the ASC through this corridor include staff and provider parking & circulation between buildings, utilities, deliveries and ambulance pick-up/drop-off. Other potential functions that could be shared between the hospital and ASC through this corridor include materials management, clinical engineering, housekeeping and security.

The MaineDEP accepted Mercy Hospital's alternatives analysis, finding that Mercy has "avoided and minimized wetland impacts to the greatest extent practicable, and that the proposed project represents the least environmentally damaging alternative that meets the overall purpose of the project." In issuing the permit, the MaineDEP found that the pond was used by waterfowl, but it was not a wetland of special significance. The permit requires Mercy Hospital to pay a total of $834,156.00 in wetland compensation. The funds have been paid into the In-Lieu-Fee program of the Maine Natural Resource Conservation Fund.

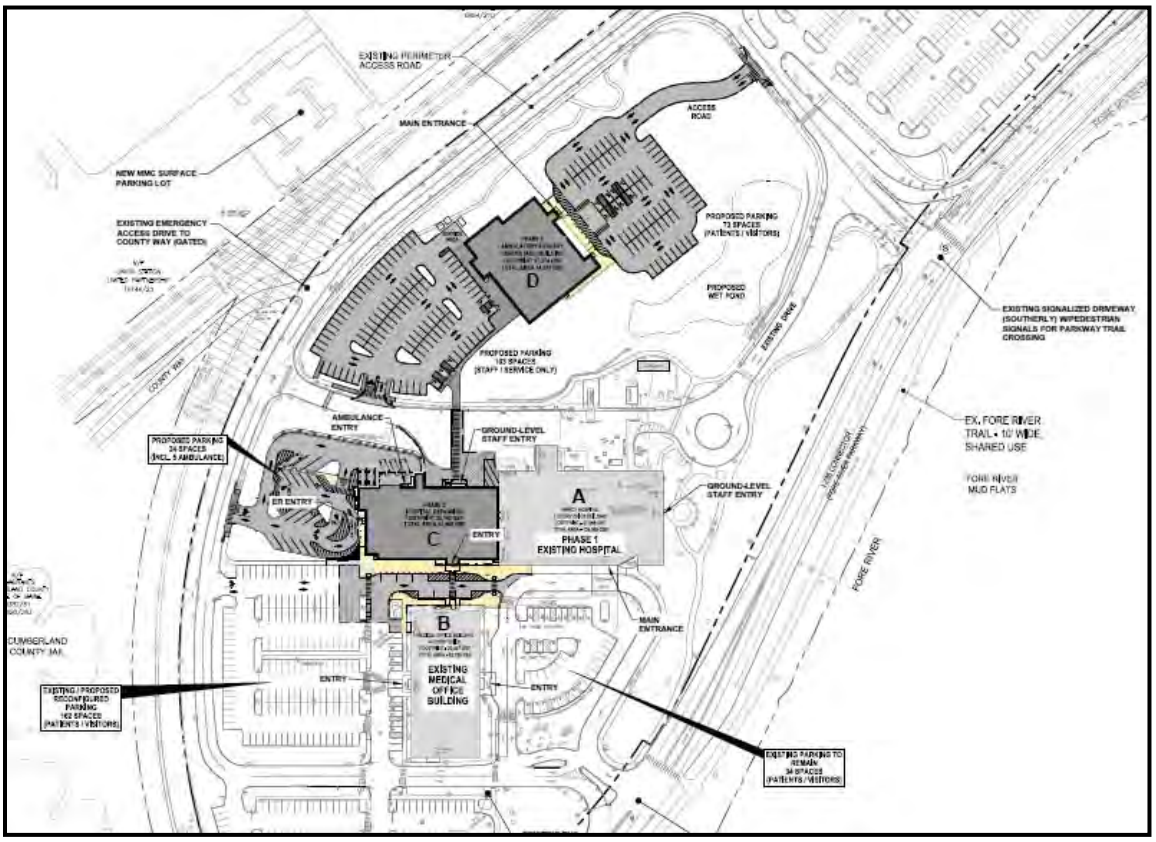
The proposed project preserves natural features to the greatest extent practicable, while allowing Mercy Hospital to provide safe, effective, cost-effective, and state-of-the-art medical services to patients in an appropriate location and manner.

G. Architecture

All buildings shall be designed or approved by a registered architect in the State of Maine. The scale, texture, colors, and massing of the buildings shall be coordinated. The full range of high-quality, permanent, and traditional or contemporary building materials and technology may be incorporated in a manner so that the development as a whole embodies distinguishing attributes that achieve the developer's desired degree of excellence and are in conformance with the architectural guidelines provided in any private development restrictions. Particular emphasis shall be placed on the appearance of building facades from public streets and highways including the Connector, from driveway and parking areas, and from other nearby buildings. Building elevation drawings shall be submitted which indicate architectural style, exterior finishes and color, building height and scale, and location and scale of window and door openings. Samples of exterior building materials shall also be submitted.

1. Design

During the Phase 1 development, Mercy requested a building that embodies the faith-based nature of their institution. The design approach utilized the pointed arch motif of Gothic Revival, a style that has historically had a great depth of meaning for Roman Catholic institutions in our country. This approach is given a modernist overlay with concentrated areas of glass wall and metal panel, with generally clean lines throughout. Mercy also wished to maintain a sense of continuity with their existing State Street facility.



Finally, the prominent waterfront location bears a direct relationship to the historic brick waterfront structures of downtown Portland. The Phase 2 expansion will continue to reflect this design intent. Future buildings will adhere to the Private Development Restrictions previously prepared as a condition of Phase 1 approval.

2. Building Footprint

The Hospital is centrally located on the high point of the site to enhance visibility from all directions. The rectangular footprint of the hospital is oriented north-south to both maximize access to sunlight and to optimize views from patient windows of the Fore River to the west. This footprint will be extended to the north as part of the Phase 2 activity as this simplifies construction of foundations, internal utilities, and internal operational connectivity among other things. The existing building's four floors above a partially exposed ground level maximize the building's height (90 ft.) with the available program while minimizing the impact on the site. The existing Medical Office Building is located perpendicular to the Hospital in an L-shaped alignment so that future connections to the Hospital Expansion and a future multi-level parking garage may be easily facilitated. The MOB currently connects to the hospital with a below grade tunnel between the buildings.

The ASC footprint has been positioned to allow for surface parking on both sides of the building, yet maintaining proximity to the main Hospital, as it is expected that ASC staff will need access the hospital (for example, staff may use the Hospital Cafeteria, etc.). The ASC positioning also allows for Hospital facilities personnel to easily travel between the buildings as they made need for supply management, maintenance, and general facilities operations.

3. Building Massing

The massing of the existing hospital building steps in, on both the east and west elevations as a response to the programmatic requirements within. This pattern will continue with the Phase 2 hospital expansion. During Phase 1, a prominent location was created for the chapel with a full-height diagonal slice at the southwest corner of the Hospital. The Medical Office Building was sited perpendicular to the hospital on the west elevation in an L-shaped configuration, creating an entry court for both buildings that opens directly onto the Fore River Parkway and river. The Medical Office Building is oriented in a manner that allows access from each side.

The Phase 2 Hospital expansion uses the stepped pattern for the third floor to help shape the building form while softening the linear building presentation. Much of the Phase 2 expansion is partially shielded from the Parkway views due to the placement of the MOB, generally in front of the Hospital expansion. The Phase 2 building height at only three levels also minimizes the overall massing effects. Finally, the recent construction of the nine (9) level 2,500 space MMC parking garage, to the east of the site, substantially impacts the background and overall visual effect of the Fore River Campus, as seen from the I-295 Corridor and Veterans Bridge. Future Hospital facilities on the Fore River Campus will not exceed the overall MMC parking garage height and are expected to actually be much smaller in overall scale.

4. Building Façade/Materials

The existing hospital façade is composed of traditional Portland red brick with light cast stone highlights. Gothic cast stone tracery throughout and stained-glass windows at the existing chapel convey the faith-based nature of the institution. A brick arcade and entry

canopy create an inviting approach on the west elevation. The majority of windows throughout are traditional punched openings, counterbalanced by the full height glass and metal panel slice at the southwest corner of the building. The windows on the west and south elevations are combined in a larger scale to read strongly at a distance from across the river. Traditional sloped metal roofing covers the chapel. The MOB follows the Hospital's lead with a complementary building face, glass, and accents to mirror the Hospital building. The Phase 2 buildings will also follow these building and materials patterns and character.

5. Roofline

The main roofline of the Hospital building is a clean modernist horizontal edge accented with a large-scale pediment centered over the main entry that is a direct reference back to Mercy's State Street building. The overall massing of the Hospital building is softened with the cascading sloped rooflines along the east and west elevations. The MOB follows with a horizontal roofline that falls at or below the Hospitals. Future buildings will follow with similar or lower rooflines. Roof top appurtenances on the ASC will be adequately screened to minimize visual impact.

6. Service Areas

The exiting service areas for the hospital are located along the partially exposed ground floor level on the east side (rear) of the building. These service areas are partially screened from view from the Fore River Parkway by the hospital itself, as well as landscaping along the Parkway frontage. The semi-trailer loading area is located to the northeast corner and is shielded from general view by the building. Waste containers and other service-related activities are buffered by appropriate screening. The MOB service area will continue to be minimal. The Phase 2 hospital expansion will generally rely on the existing Hospital service areas, as the loading area was originally sized based on the Hospital's full anticipated build-out. Service areas for future buildings will be placed to consider buffering and shielding from important views to the extent practicable. This applies to the ASC building that will have a modest waste collection and utility area at the east side of the facility, facing the railroad tracks.

7. Building and Site Lighting

Ground-mounted and building-mounted lighting provides general illumination of the building and safety and security over building entrances and walks and within parking fields. Building mounted lighting places specific emphasis on the Phase 1 Hospital arcade and entrance canopy along the westerly elevation. Site Lighting is provided throughout the Campus with the use of "Heritage" style fixtures that blend traditional architecture with modern performance. Fixture heights do not exceed 30 feet along primary drives, 25 feet within parking fields and 12 to 15 feet around pedestrian walks and building perimeters. These lighting measures will remain as part of the Phase 2 activity.

Parking area and pedestrian lighting is of high-quality construction and materials and with a character that complements the architectural features and style of the building. The site lighting meets the City of Portland strict requirements regarding minimum, average, and maximum levels of illumination, maximum wattage, and mounting height.

H. Signs

Signage shall be focused internally to the site or to the Connector and shall not be oriented or scaled to address Route 1 or Interstate 295, with the exception of the hospital and major office buildings. Development proposals shall identify all proposed signage. Signs shall be designed in proportion and character with the building facades. All signs shall be constructed of permanent materials and shall be coordinated with the building and landscaping design through the use of appropriate materials and finishes.

All signage at main entrance and way finding signs throughout the site shall be of a character and quality consistent with that of the building. Signs shall be illuminated at the entrances, with consistent graphics and logo (custom screen-printing) throughout the project.

I. Master plan

Prior to development on the property, Mercy shall provide a master plan of the campus. The master plan shall include the following: The location of the buildings on the site; infrastructure of the site; identification of common areas; traffic circulation; architectural character and treatment of the buildings; proposed building envelopes; phasing and timing of the development; private development restrictions; and such other information necessary and sufficient to ensure compliance with the standards in this section. Master plans are dynamic representations that assist in guiding projects through phased development. Master plans are flexible and adaptable to changes that occur within the development process. The master plan shall be subject to periodic revision and update as needed and as phased development occurs over time.

A revised master plan of the campus is provided as Figure 1. As summary of the phased development that balances business needs and economic capacity is as follows:

- **Initial Phase 1 – Constructed 2008**
  - 137,832 SF Hospital
  - 82,186 SF Medical Office Building
  - Surface parking for 762 vehicles
  - Utilities extended for initial and future phases
  - Campus grounds fully landscaped and open spaces established
  - Exterior systems including med gas, auxiliary power, and above ground heating oil tank storage
- **Phase 2 – Proposed 2019/2020**
  - 54,889 SF Hospital expansion over 3 levels to include emergency department and ancillary programming
  - 34,987 SF Outpatient Ambulatory Surgical Center within free-standing 2-story building
  - Surface parking resulting in a net increase of 95 parking spaces on the Campus
  - Partial filling of the former gravel pit for ASC and parking placement
  - Wet Pond construction for stormwater management

- **Future Phases**

  - ASC Expansion
  - Parking Structure(s) to support 700-900 parking spaces subject to demand analysis and future programming
  - 50,000 to 200,000 SF Hospital facilities may be attached or free-standing structures to meet expanding outpatient and/or acute care health care delivery
  - Relocation of Maintenance facility
  - Total building space equals to 500,000 to 600,000 SF can be supported on the Campus depending on building height etc.

II. DIMENSIONAL REQUIREMENTS

The following dimensional requirements shall apply to the property as a whole and not to individual lots (if any) within the property:

Maximum Impervious Surface Ratio

Eighty (80) percent. The Phase 1 development resulted in 57 percent impervious and the Phase 2 proposal will increase the ratio to 66 percent.

Maximum Building Height

Ninety (90) feet. The maximum building height on the Campus is currently 90 feet and that will remain unchanged.

Minimum Front Yard Landscaped Buffer

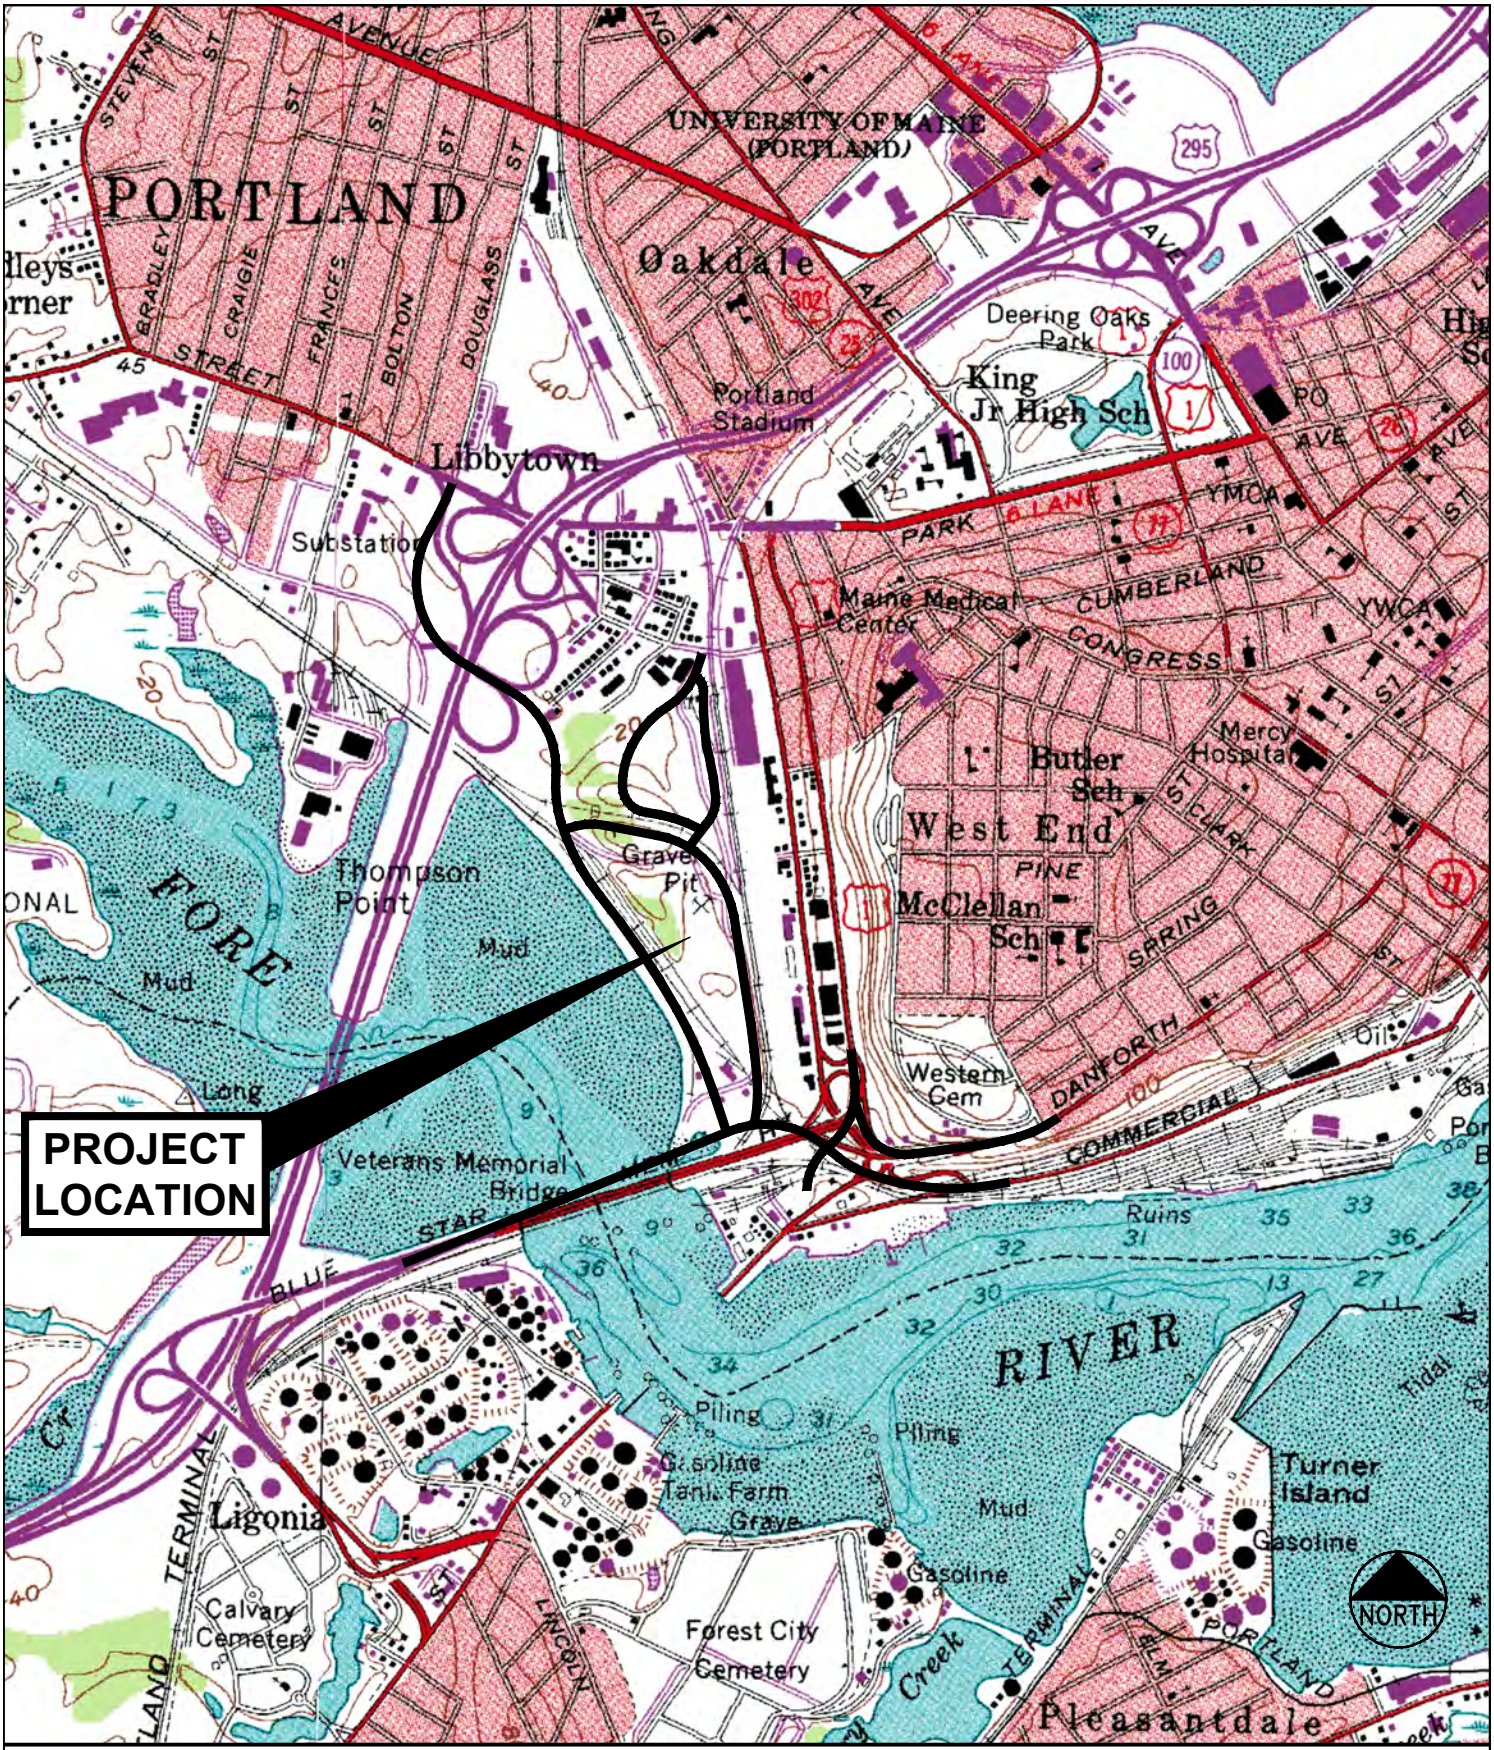
Twenty (20) feet from the edge of the connector right-of-way. Retaining walls, walkways, trails and pathways may occur within the landscaped buffer. Buildings and expanses of paved surfaces for vehicular use are prohibited.

Minimum Side Yards

Ten (10) feet.

Minimum Rear Yard

Ten (10) feet.



Pavement Setback from property

Fifteen (15) feet; twenty (20) feet from connector right of way.

The proposed development meets the above dimensional requirements.

SignChart® and Recommendation Book Legal Disclaimer. Certain information and Content in SignChart® is prepared as the result of a Design Services Agreement between Monigle Associates and their clients. The information and Content are part of an original and unpublished design by Monigle Associates. The concepts, detailing, and information shall not be reproduced, copied, or utilized except for the specific project and client for which they were created, without previous authorization from Monigle Associates and their clients. The information is for design intent only and shall be used only as a guide to produce the finished sizes, appearances, and functions. Nothing contained within the information or Content provided by Monigle Associates shall be construed as a design for any engineered element. The Sign Vendor shall be responsible for all structural, electrical, mechanical, and foundation engineering and to meet or exceed all local, state, national, ADA or other applicable codes. The information, Content and support documentation was not produced under an architectural services agreement. Sign Vendor is to perform a technical audit of all site conditions to ensure that the sign or element being proposed can be permitted, approved by the landlord if applicable and will work/fit in the intended location. Sign Vendor is to verify all dimensions, fit, electrical, servicing, mounting conditions, codes and any other necessary requirements prior to sign or element fabrication. Using the technical audit information, and prior to manufacturing any new sign, sign vendor shall confirm that the visual representation (photo morph or sign rendering) of the proposed new sign will fit and appear as shown in the visual representation. The sign types, descriptions and dimensions for new signs noted in SignChart are for a general guide only (largely for initial design approval, pricing and planning purposes) and are not intended as final build sizes unless the sign vendor has confirmed the fit will generally match the provided visual representation. If the installed sign does not fit as shown in the visual representation the sign vendor will be responsible for replacing the sign at their cost. © 1999 - 2019 MONIGLE ASSOCIATES INC., ALL RIGHTS RESERVED - SIGNCHART IS A REGISTERED TRADEMARK.

Sign Vendor is to verify all dimensions, fit, electrical, servicing, mounting conditions, codes and any other necessary requirements prior to sign or element fabrication. Using the technical audit information, and prior to manufacturing any new sign, sign vendor shall confirm that the visual representation (photo morph or sign rendering) of the proposed new sign will fit and appear as shown in the visual representation. The sign types, descriptions and dimensions for new signs noted in SignChart are for a general guide only (largely for initial design approval, pricing and planning purposes) and are not intended as final build sizes unless the sign vendor has confirmed the fit will generally match the provided visual representation. If the installed sign does not fit as shown in the visual representation the sign vendor will be responsible for replacing the sign at their cost. © 1999 - 2019 MONIGLE ASSOCIATES INC., ALL RIGHTS RESERVED - SIGNCHART IS A REGISTERED TRADEMARK.

The information is for design intent only and shall be used only as a guide to produce the finished sizes, appearances, and functions. Nothing contained within the information or Content provided by Monigle Associates shall be construed as a design for any engineered element. The Sign Vendor shall be responsible for all structural, electrical, mechanical, and foundation engineering and to meet or exceed all local, state, national, ADA or other applicable codes. The information, Content and support documentation was not produced under an architectural services agreement. Sign Vendor is to perform a technical audit of all site conditions to ensure that the sign or element being proposed can be permitted, approved by the landlord if applicable and will work/fit in the intended location. Sign Vendor is to verify all dimensions, fit, electrical, servicing, mounting conditions, codes and any other necessary requirements prior to sign or element fabrication. Using the technical audit information, and prior to manufacturing any new sign, sign vendor shall confirm that the visual representation (photo morph or sign rendering) of the proposed new sign will fit and appear as shown in the visual representation. The sign types, descriptions and dimensions for new signs noted in SignChart are for a general guide only (largely for initial design approval, pricing and planning purposes) and are not intended as final build sizes unless the sign vendor has confirmed the fit will generally match the provided visual representation. If the installed sign does not fit as shown in the visual representation the sign vendor will be responsible for replacing the sign at their cost. © 1999 - 2019 MONIGLE ASSOCIATES INC., ALL RIGHTS RESERVED - SIGNCHART IS A REGISTERED TRADEMARK.

Sign Vendor is to verify all dimensions, fit, electrical, servicing, mounting conditions, codes and any other necessary requirements prior to sign or element fabrication. Using the technical audit information, and prior to manufacturing any new sign, sign vendor shall confirm that the visual representation (photo morph or sign rendering) of the proposed new sign will fit and appear as shown in the visual representation. The sign types, descriptions and dimensions for new signs noted in SignChart are for a general guide only (largely for initial design approval, pricing and planning purposes) and are not intended as final build sizes unless the sign vendor has confirmed the fit will generally match the provided visual representation. If the installed sign does not fit as shown in the visual representation the sign vendor will be responsible for replacing the sign at their cost. © 1999 - 2019 MONIGLE ASSOCIATES INC., ALL RIGHTS RESERVED - SIGNCHART IS A REGISTERED TRADEMARK.

The Sign Vendor shall be responsible for all structural, electrical, mechanical, and foundation engineering and to meet or exceed all local, state, national, ADA or other applicable codes. The information, Content and support documentation was not produced under an architectural services agreement. Sign Vendor is to perform a technical audit of all site conditions to ensure that the sign or element being proposed can be permitted, approved by the landlord if applicable and will work/fit in the intended location. Sign Vendor is to verify all dimensions, fit, electrical, servicing, mounting conditions, codes and any other necessary requirements prior to sign or element fabrication. Using the technical audit information, and prior to manufacturing any new sign, sign vendor shall confirm that the visual representation (photo morph or sign rendering) of the proposed new sign will fit and appear as shown in the visual representation. The sign types, descriptions and dimensions for new signs noted in SignChart are for a general guide only (largely for initial design approval, pricing and planning purposes) and are not intended as final build sizes unless the sign vendor has confirmed the fit will generally match the provided visual representation. If the installed sign does not fit as shown in the visual representation the sign vendor will be responsible for replacing the sign at their cost. © 1999 - 2019 MONIGLE ASSOCIATES INC., ALL RIGHTS RESERVED - SIGNCHART IS A REGISTERED TRADEMARK.

Certain information and Content in SignChart® is prepared as the result of a Design Services Agreement between Monigle Associates and their clients. The information and Content are part of an original and unpublished design by Monigle Associates. The concepts, detailing, and information shall not be reproduced, copied, or utilized except for the specific project and client for which they were created, without previous authorization from Monigle Associates and their clients. The information is for design intent only and shall be used only as a guide to produce the finished sizes, appearances, and functions. Nothing contained within the information or Content provided by Monigle Associates shall be construed as a design for any engineered element. The Sign Vendor shall be responsible for all structural, electrical, mechanical, and foundation engineering and to meet or exceed all local, state, national, ADA or other applicable codes. The information, Content and support documentation was not produced under an architectural services agreement. Sign Vendor is to perform a technical audit of all site conditions to ensure that the sign or element being proposed can be permitted, approved by the landlord if applicable and will work/fit in the intended location. Sign Vendor is to verify all dimensions, fit, electrical, servicing, mounting conditions, codes and any other necessary requirements prior to sign or element fabrication. Using the technical audit information, and prior to manufacturing any new sign, sign vendor shall confirm that the visual representation (photo morph or sign rendering) of the proposed new sign will fit and appear as shown in the visual representation. The sign types, descriptions and dimensions for new signs noted in SignChart are for a general guide only (largely for initial design approval, pricing and planning purposes) and are not intended as final build sizes unless the sign vendor has confirmed the fit will generally match the provided visual representation. If the installed sign does not fit as shown in the visual representation the sign vendor will be responsible for replacing the sign at their cost. © 1999 - 2019 MONIGLE ASSOCIATES INC., ALL RIGHTS RESERVED - SIGNCHART IS A REGISTERED TRADEMARK.

South Portland, ME 04106

RE: Mercy Hospital – Ability to Serve Request

Dear Kaleb:

This letter is in response to your November 22, 2019 letter to Unitil requesting confirmation of Unitil's ability to serve the Mercy Hospital Phase II Development. Until currently has natural gas infrastructure serving the existing Mercy Hospital Fore River Campus. Based on the preliminary design provided, our gas facilities have the capacity to serve the proposed Development.

If you have any questions, please contact me at 207-541-2534.

Sincerely,

Michael T. Smith
Manager, Business Services

Design Engineer
Gorrill Palmer
707 Sable Oaks Drive, Suite 30
South Portland, ME 04106

Subject: Mercy Hospital - Phase II Development
Fore River Parkway – Portland, Maine
Letter of Ability to Serve Request

SAP Notification Temp is TBD
SAP Notification Permanent is TBD

(please set these up asap)

Project Description:

The proposed development includes construction of Phase II at the Northern Light℠ Mercy Hospital – Fore River Campus. The project includes an approximately 20,140 SF footprint expansion of the existing hospital facility, construction of an approximately 17,574 SF footprint stand-alone Ambulatory Surgical Center (ASC), and associated pedestrian and vehicular infrastructure.

CMP has the ability to serve the proposed project in accordance with our CMP Handbook (web link below). We can provide you the desired pad or pole mounted transformers per your request and city approval, in accordance with our CMP Handbook of Standard Requirements. If you have any questions on the process, or need help in completion of the documents, **please contact me at 207-629-1489.**

Here is our typical process for getting your three phase or CT rated single phase service installed. If you have any questions, please let me know. The underlined links will redirect you to the appropriate site for additional information. If this is a single phase service with all self-contained metering, the process is simplified, but still begins with a call to CMP.

Service Milestones for Three Phase Services and CT Rated Single Phase Services. Please refer to

CMP Installation Checklists for other installations.

- Call 1-800-565-3181 to establish a new account (if needed) and an SAP work order. Please provide both of these to me.
- Submit Load information. Please complete the attached EDET (excel file) using load information. . Please complete this and email back to me.
- Submit the easement information worksheet. Please complete this form and either email or fax back to me.
- Submit any electronic drawings (PDF (preferred) or DWG files) of the site layout and proposed electrical connections if you have them.
- Preliminary meetings with CMP Advisor and Engineer to determine details of job (I will need to schedule with your electrician/contractor-please let me know who this is)
- Field planner design appointment to cost out job and develop CMP Invoice. The invoice is typically generated 5-6 weeks after the design appointment. This expires after 90 days from the invoice date.
- CMP submits invoice to the customer for payment (typically via email). Payment received from customer.
- Easements (based on easement information worksheet) sent out, signed and originals returned to CMP.
- Job scheduled for completion after the electrical inspection has been received.

This process can take several months, depending upon several factors including transformer or materials delivery, return of completed paperwork, and other jobs in the system that may be ahead of yours. In addition, contact with the other utilities, including telephone and cable, should be commenced as soon as practical. They may have additional work or charges in addition to the CMP work required to bring your project on line.

Please complete the attached forms (the specific instructions are on each form) and email them back to me at your earliest convenience.

For your convenience, here is a link to the CMP Website which contains our Handbook with details on most service requirements: CMP Handbook of Standard Requirements

You will be responsible for installing the customer connections, conduits, and metering in accordance with the CMP Handbook of Standard Requirements. The transformer will be sized based on your submitted load sheets.

Your deposit amount will be typically based on an estimated two month bill, calculated from your completed load sheet unless otherwise determined by CMP.

Metering:

All metering (including locations) must be preapproved by CMP.

Chapter 324 Interconnections:

Please be advised that if you plan to install solar/wind/hydro generation, you must complete an application under the MPUC mandated Chapter 324 Interconnection Standards. If you go to Chapter 324 Interconnection Standards and follow the instructions for the Small Generator Interconnection Procedures, CMP can do this work in parallel to your service request that will be handled by me. If you project is under 660 KW You will be able to have a Customer Net Energy Billing contract. Information concerning Customer Net Energy Billing can be accessed thru the Chapter 324 website or by clicking here: Net Energy Billing

Reallocation/Line Extensions:

Recently, changes were made to the three-phase construction policy, which require CMP to reallocate construction costs paid by customers. If applicable, those projects identified as "developments" do not qualify for reallocation of funds. Please see this document at our website for details about the reallocation conditions. Any reallocation charges will be specifically denoted on your invoice. The website address for this is: PolyphaseLineExtension .

This line extension will be part of Central Maine Power's distribution system. In the event the property served under this Agreement is sold or otherwise conveyed, all rights and obligations of the Agreement shall stay with the property. Please note that if you rent or lease this property to another and you want to receive the reimbursement payments, you must make special arrangements with the Central Maine Power Company. Otherwise, any reimbursement payments will be sent to the "Customer" taking service at the service location.

Electricity Supplier Information:

Central Maine Power Company (CMP) will provide your facility with electric delivery service. If you don't already have a provider, you will need to make arrangements with a competitive electricity provider in order to receive electricity supply for your facility. In the event you fail to choose a competitive electricity provider, you will receive Standard Offer service arranged by the Maine Public Utilities Commission. If you wish to be served by a competitive electricity provider immediately upon establishment of delivery service, you must arrange for this service directly through your chosen competitive electricity provider, who must enroll your account no later than 5 PM on the business day prior initiation of delivery service by CMP. An up-to-date list of competitive suppliers can be found at the:

1) Maine Public Utilities Commission (MPUC) web site- **Maine PUC**
2) By calling the MPUC at (207) 287-3831

Att. DD

Portland Water District

FROM SEBAGO LAKE TO CASCO BAY

November 15, 2019

Stephen Bushey P.E.
707 Sable Oaks Drive, Suite 30
South Portland, ME 04106

Re: 175/195 Fore River Parkway, PO
Ability to Serve with PWD Water

Dear Mr. Bushey:

The Portland Water District has received your request for an Ability to Serve Determination for the noted site submitted on August 13, 2019. Based on the information provided per plans dated November 14, 2019, we can confirm that the District will be able to serve the proposed project as further described in this letter. **Please note that this letter constitutes approval of the water system as currently designed. Any changes affecting the approved water system will require further review and approval by PWD.**

Conditions of Service

The following conditions of service apply:

- A new 6-inch fire service and 4-inch domestic service with a 1.5-inch meter may be installed to the ASC Facility from the 12-inch PVC water main in the Mercy Hospital ROW. The service(s) should enter through the properties frontage at least 10-feet from any side property lines.
- An approved backflow prevention device must be installed on the service lines directly after the meter and before the fire sprinkler riser prior to service activation. Please refer to the PWD website for more information on cross-connection control policies.
- The existing 12-inch PVC service to Mercy Hospital may be used for the proposed building expansion as long as the project team determines that it will provide adequate flow and pressure for the proposed use. The existing 8-inch meter has sufficient capacity to handle the additional demand of the site.

Prior to construction, the owner or contractor will need to make an appointment to complete a service application form and pay all necessary fees. The appointment shall be requested through MEANS@pwd.org or by calling 207-774-5961 ext. 3199. Please allow (3) business days to process the service application paperwork. PWD will guide the applicant through the new development process during the appointment.

Existing Site Service

According to District records, the project site does currently have existing water service. A 12-inch diameter PVC combined fire and domestic service line provides water service to the site. Please refer to the "Conditions of Service" section of this letter for requirements related to the use of this service.

Water System Characteristics

According to District records, there is an 12-inch diameter PVC water main in Mercy Hospital ROW and a public fire hydrant located adjacent to the site. Recent flow data is not available in this area. The most recent static pressure reading was 99 psi.

Public Fire Protection

The installation of new public hydrants to be accepted into the District water system will most likely not be required. It is your responsibility to contact the City of Portland Fire Department to ensure that this project is adequately served by existing and/or proposed hydrants.

Domestic Water Needs

The data noted above indicates there should be adequate pressure and volume of water to serve the domestic water needs of your proposed project. Based on the high water pressure in this area, we recommend that you consider the installation of pressure reducing devices that comply with state plumbing codes.

Private Fire Protection Water Needs

You have indicated that this project will require water service to provide private fire protection to the site. Please note that the District does not guarantee any quantity of water or pressure through a fire protection service. Please share these results with your sprinkler system designer so that they can design the fire protection system to best fit the noted conditions. If the data is out of date or insufficient for their needs, please contact MEANS to request a hydrant flow test and we will work with you to get more complete data.

Should you disagree with this determination, you may request a review by the District's Internal Review Team. Your request for review must be in writing and state the reason for your disagreement with the determination. The request must be sent to MEANS@PWD.org or mailed to 225 Douglass Street, Portland Maine, 04104 c/o MEANS. The Internal Review Team will undertake review as requested within 2 weeks of receipt of a request for review.

If the District can be of further assistance in this matter, please let us know.

Sincerely,
Portland Water District

Robert A. Bartels, P.E.
Senior Project Engineer

Att. EE

Neighborhood Meeting Certification

I, Stephen R. Bushey, P.E., hereby certify that a neighborhood meeting was held on Wednesday, December 11, 2019 at the Fore River Hospital Cafeteria, 175 Fore River Parkway, Portland, Maine at 5:30 P.M.

I also certify that on November 22, 2019, invitations were mailed to the following:

1. All addresses on the mailing list provided by the Planning Division, including property owners within 500 feet of the proposed development or within 1000 feet of a proposed industrial subdivision or industrial zone change.

2. Residents on the "interested parties" list.

3. A digital copy of the notice was also provided to the Planning Division (jmy@portlandmaine.gov and ldobson@portlandmaine.gov) and the assigned planner to be forwarded to those on the interested citizen list who receive e-mail notices.

Signed,

12/17/19 — December 17, 2019

(date)

Attached to this certification are:

1. Copy of invitation sent
2. Sign-in sheet
3. Meeting minutes

GORRILL PALMER

707 Sable Oaks Drive, Suite 30
South Portland, Maine 04106
207.772.2515

November 21, 2019

Dear Neighbor:

Please join us for a Neighborhood Meeting to discuss our plans for the proposed development at Mercy Hospital Fore River Campus in Portland, ME (Tax Map/Block/Lot - 73 A-1, B-2, B-7; Map 74 A-1, A-2, B-3, B-11, B-12; 74A A-1, U-2; 75 A-3, B-4, B-30; 75AA-1, A-17; 76 B-33, B-1, B-2).

The proposed project includes a 19,260 SF footprint building addition to the existing Mercy Hospital at Fore River Parkway and a 17,610 SF footprint Ambulatory Surgical Center and parking at 175 Fore River Parkway in Portland, ME. Mercy Hospital dba Northern Light Mercy Hospital has filed a Level III Site Plan Application with the Planning Authority.

Meeting Location:	**Mercy Hospital – 175 Fore River Parkway, Portland, ME**
	Cafeteria on Level 1
Meeting Date:	**December 11, 2019**
Meeting Time:	**5:30 PM**

The City Code requires that property owners within 500 feet (except notices must be sent to property owners within 1,000 feet for industrial zoning map amendments and industrial subdivisions) of the proposed development and residents on an "interested parties list", be invited to participate in a neighborhood meeting. A sign-in sheet will be circulated and minutes of the meeting will be taken. Both the sign-in sheet and minutes will be submitted to the Planning Board. The meeting will last no more than 30-45 minutes.

If you have any questions, please feel free to contact Steve Bushey, P.E. at 207.772.2515 x286.

Sincerely,

GORRILL PALMER

Stephen R. Bushey, P.E.
Associate/Sr. Project Manager
sbushey@gorrillpalmer.com

Note: Under Section 14-32(C) and 14-525 of the City Code of Ordinances, an applicant for a Level III development, subdivision of over five lots/units, or zone change is required to hold a neighborhood meeting within three weeks of submitting a preliminary application or two weeks of submitting a final site plan application, if a preliminary plan was not submitted. The neighborhood meeting must be held at least seven days prior to the Planning Board public hearing on the proposal. Should you wish to offer additional comments on this proposed development, you may contact the Planning Division at 874-8721 or send written correspondence to the Planning and Urban Development Department, Planning Division 4th Floor, 389 Congress Street, Portland, ME 04101 or by email to: cdg@portlandmaine.gov

MEETING MINUTES

Project: **Mercy Hospital Phase 2 Expansion, Portland, Maine**

Job #: **3257.04**

Date: **December 11, 2019 – 5:30 PM**

Location: **Project Site – 175 Fore River Parkway – Hospital Cafeteria**

Subject: **Neighborhood Meeting**

Attendees: **See Attached Sign-in Sheet**

In accordance with the City of Portland Planning Board Requirements, a Neighborhood Meeting was scheduled to discuss the proposed Phase 2 Hospital Expansion and Ambulatory Surgical Center (ASC) buildings which includes new surface parking facilities and related utility improvements.

The meeting was held on Wednesday, December 11, 2019 at 5:30 P.M. and various Mercy representatives were present on site from 5:15 PM–6:45 PM. Two (2) members of the public attended the meeting. The following is a synopsis of the meeting:

Mercy Overview

- Meeting held at the Fore River Hospital Cafeteria
- Meeting started promptly at 5:30 pm
- Charlie T. provided brief overview of project proposal using overhead slide graphics.
    - Mercy focus on both Acute care delivery with Hospital expansion, that will allow full departure from State Street facility
    - Patient care shifting to outpatient services and proposed Ambulatory Surgical Center is a result of that shift in care delivery.
    - Outpatient services are purposely separated from the acute care infrastructure. Buildings are not connected but can share certain site features including access, service, utilities.
- Charlie T. explained purpose behind filling of the pit.
    - Cost effective- saves money
    - Mercy has received permits from the Maine DEP and US Army corps of Engineers
- Renderings of the Hospital Expansion onto the existing building were shown and reviewed with key points made about continuity of architecture etc. The proposed expansion will include new ED with dedicated entrances for Ambulances and patients.
- Rendering of the proposed ASC and its positioning within the former gravel pit.

- Melissa S provided a brief overview of Mercy's community outreach and specific discussions with Portland Trails. Current themes under discussion include:
    - Trail System enhancement, both on campus and off campus.
    - Community gardens
    - Waterfront enhancement for activating use
    - Neighborhood association meetings
- SRB provided brief comments about other site features include where utilities are located, VRAP aspects and ash, and the stormwater management pond.

Public Comment

Mr. and Mrs. Parsons offered numerous questions including:

- What was Portland Trails reaction to the filling of the pond? Mercy responded that PT is not supportive of filling the pond but have acknowledged they will work with Mercy on mitigation strategies.
- The pond provides holistic value to the campus, so what can Mercy develop to maintain those attributes?
- There were comments regarding the services that will be transferred to the Fore River. Does Mercy intend to eliminate any services currently offered at State Street? Charlie T. replied that all services offered at State Street will move to the Fore River, although delivery is changing all the time. Fewer beds are required at the new campus, simply because so many services now no longer need overnight stay at the Hospital.
- There were questions and comments regarding architecture, energy efficiency, solar applicability, air quality. Ellen B. of SMRT offered incite to these topics. The Mercy buildings will be specifically designed for these criteria; solar is not currently contemplated for the site.
- It might be worthy of obtaining some old photos of the site to better understand the genesis off the gravel pit.
- Brief mention of the Fore River Parkway trail and the underpass beneath the Parkway as the trail extends to Frederick Street. Not a pleasant little length of the trail, due to poor visibility, etc. this might be an area to focus some enhancement to make it more comfortable for users.

The meeting adjourned around 6:30 pm.

Subject: Application for Level III Site Plan Application
Northern Light Mercy Hospital – Fore River Campus Consolidation
Project #: PL-000570-2019
Supplemental Information Prior to Public Hearing

Dear Matt:

We are pleased to provide the following supplemental information associated with the Staff and Planning Board comments we have received thus far on the Mercy Hospital Phase 2 Expansion project and as discussed at our January 28, 2020 meeting with the Planning Board. Our team has prepared materials related to the following topics outlined under your next steps of action for the project:

1. **Updated TDM Plan** – Mercy Hospital and Gorrill Palmer are currently in the process of completing updates to the Transportation Demand Management Plan to bring the plan up to date with current City standards. The work will continue over the next few weeks as additional information gathering and coordination is completed. The goal is to have an updated Draft TDM document submitted to the City by February 18, 2020. Understanding that the City review and any further revisions to the TDM will likely require additional time that may extend beyond the Planning Board Public Hearing, we are requesting that the finalization of the Mercy TDM be made a condition of approval tied to the issuance of a Certificate of occupancy for the ASC building.

2. **Updated Master Plan Document** – The accompanying Contract Zone Compliance document has been updated to reflect the Planning Board deliberations and Mercy's commitment to preserving and maintaining the proposed wet pond and the pedestrian trails in perpetuity as part of the overall master plan for the campus. The updated Figure 1 of the document reflects long term programming on the campus to include:

   - Future vertical expansion of the Hospital;
   - Future expansion of the proposed Ambulatory Surgical Center (ASC);
   - Future structured parking within identified locations north of the ASC and/or north of the MOB (Medical Office Building);
   - Future outpatient facilities located off the Southerly drive/entrance; and

- Preservation of the Proposed Phase 2 wet pond and its surrounding landscape zones dedicated to pedestrian access and recreational use.

Mary Costigan of Bernstein Shur continues to coordinate with the City's Corporation Counsel Office on the documentation to memorialize Mercy's commitment. The document is expected to be ready for review the week of February 10th. We trust that Corporation Counsel will share this with you and advise you of the status. Figure 5 has also been updated based on the City staff comments.

3. Responses to Staff Comments

- **Pedestrian Circulation** – The accompanying Figure 5, *Master Plan Pedestrian Access Routes*, that supports the CZA compliance document, has been updated to reflect the following City Staff comments:

  - Crosswalk at the Northerly Driveway – This has been added to the figure and the plans with the understanding that the crosswalk will not be installed unless a METRO Bus Stop location is established on the north side of the driveway. Currently, there is no sidewalk to the north side of the driveway, thus precluding the need for a driveway crosswalk, unless the bus stop is created. The positioning of the bus stop remains subject to ongoing METRO planning efforts associated with upcoming route changes and enhancements. Mercy has a tentative meeting scheduled with Greg Jordon of METRO the week of February 10th to discuss their ongoing Service Route updates.

  - Bike Markings Along the Fore River Parkway – Figure 5 has also been updated to include pavement markings along the Parkway from the south driveway, north to the northerly driveway. Bicycle path markings will be painted along the existing road shoulder up to and thru the right turn lane into the north driveway.

  - Crosswalk at the ASC/South D/W Intersection – A crosswalk connecting the staff parking lot to the ASC driveway will be provided as shown on the updated C-3.1 Overall Site Plan and C-3.2 The Site Wayfinding plans.

  - Crosswalk Maintenance – Maintenance of the existing crosswalk surface material at the southerly driveway crosswalk has been referenced by City staff. The original thermoplastic material has deteriorated and needs to be replaced. We propose to remove the thermoplastic material and replace with pavement paint marking that is compliant with City and MDOT standards.

South D/W Crosswalk

- Campus Access Routes/Wet Pond Pedestrian Path – the latest site plans and landscape plans from SMRT include the installation of a pedestrian pathway partially along the perimeter of the wet pond and connecting to the rear of the existing hospital and over to the existing sidewalk that has circled the existing pond since the original site construction. This naturalized pathway will contain the following aesthetic/recreational enhancements:
  - Stone dust surface;
  - Field Stone wall alcoves with bench seating overlooking the wet pond;
  - Several boardwalks extending over drainage paths to allow close connectivity to the water; and
  - A variety of landscape seed mixes to provide coverages that span from mowed lawn around the development edges to naturalized seed mixes that will offer a high quality natural environmental around the pond, seasonal color variation and visual interest throughout the year. These areas will extend along the west side of the ASC parking lots and building, while covering over an acre of area.

  The pathway is expected to be maintained year-round to provide access for ASC staff to the Hospital ground level entrances.

- Rectangular Rapid Flashing Beacon (RRFB) installation at the existing Fore River Parkway crosswalk at the Mercy northerly driveway – City staff have requested the installation of a RRFB at this location. Existing conditions include the following:
  - There is an existing 8' wide painted crosswalk at this location to cross from the existing Mercy Sidewalk over to the Fore River Parkway Trail.
  - There is an existing 8' wide raised divider island that functions as a respite zone for pedestrians during the crossing.
  - Sight distances in each direction exceed 400 feet.
  - The posted speed on the Parkway is 40 MPH
  - The signaled intersection of Mercy's southerly entrance and the parkway is located approximately 850 LF south of the crossing. The signalized intersection contains push button activated signal heads and a pedestrian crossing phase for Trail users crossing the road at this location.
  - There is a set of RRFB at a pedestrian crossing of the Parkway off the end of Frederick Street, located approximately 1,500 LF north of the Mercy driveway. This pedestrian crossing connects the sidewalk system off the end of Frederick Street to the Fore River Parkway Trail. This location is also identified as a METRO bus stop location.
  - Based on the existing conditions, Gorrill Palmer suggests that prior to Mercy Hospital participating in the installation of the RRFB at the Northerly driveway pedestrian crossing, the City of Portland complete the following actions:
    - Examine the accident history along the Parkway to determine whether there are any high accident locations/conditions, per MaineDOT criteria.

- Contact the MaineDOT for authorization to install the RRFB along the Parkway;
- Contact the Portland Trails representatives to solicit their input as to the need/desire for the RRFB installation at this proposed location.
- Verify that the installation of RRFB will not result in conditions that may lead to increased accident issues including the proclivity for rear end collisions that have resulted at other locations where RRFBs have been installed.

It is the opinion of Gorrill Palmer Consulting Engineers that the placement of a RRFB at the Mercy Northerly driveway is not warranted based on the existing crossing conditions along the parkway. There are already two other signaled pedestrian crossings to both sides of this location and adding an RRFB will not substantially improve safety, while posing the risk that vehicular movements may actually be less safe. We believe it is also necessary to better understand the METRO transit bus routing planning and programming before firm consideration and action is taken for the RRFB installation.

4. **Updated Construction Management Plan (CMP)** – Consigli has prepared the accompanying updated CMP to address dewatering and other supporting plans in accordance with the City's CMP template.

5. **Lighting** – SMRT has completed the site lighting and photometrics plans accompanying this letter. The proposed area lighting will consist of the following:

- Area lights – RA17 and RA25 Era® LED fixture from Kim Lighting
- Bollard lights – Pavilion Round Bollard PA7R by Kim Lighting

Catalog cuts for each of these fixtures have been previously uploaded to Eplan.

6. **Waiver Requests** – As outlined in the January 28, 2020 Planning Board Staff report, Mercy is requesting several waivers for Planning Board consideration. First, we have modified the latest site plans to increase the provided bicycle spaces to the required total of 58 bike spots on the site. We have placed bike racks

at several locations around the campus for ease of use and proximity to building entries. A waiver for the bicycle parking is no longer requested as we believe we are compliant with the Code requirements for bike parking on the Campus.

The first request for a waiver of the Flooding standards remains applicable and we understand that both Staff and the Planning Board seem supportive of the request. No further information will be provided.

Our remaining waiver request pertains to our request to omit curb and sidewalk along the Fore River Parkway between the southerly and northerly driveways. In accordance with Section 14-506 of the Code we offer the following evidence that at least the two following conditions outlined in this section exist at the site:

Applicable Condition

"A safe alternative-walking route is reasonably and safely available, for example, by way of a sidewalk on the other side of the street that is lightly traveled."

Supporting Evidence:

There is an existing paved sidewalk that extends from the southerly driveway to the northerly driveway, within the site. This sidewalk is maintained by Mercy Hospital and it runs within the front yard area of the site, while passing by the ground level hospital entrance and over to the south side of the northerly driveway. Crosswalks connecting this sidewalk to the Fore River Parkway Trail are located at both the Southerly and northerly driveways. Secondly, the Fore River parkway trail is located on the waterfront side of the Parkway. The Parkway Trail begins at the Congress Street intersection and generally runs the length of the Parkway from Congress Street to the Veterans Bridge. This 8'-10' multi-use path crosses the Parkway at Mercy's southerly signalized driveway where it extends to the south to the Veteran's Bridge. The Parkway does not contain any further sidewalks on Mercy's side of the road. The existing bridges just north of the Mercy site, preclude the ability to place a sidewalk on the east side of the Parkway from Mercy's northerly driveway to the I-295 interchange ramps.

Applicable Condition

"Runoff from the development site or within the street does not require curbing for stormwater management."

Supporting Evidence:

The Fore River Parkway was constructed by the MaineDOT without curbing along the roadway for the section of road between Mercy's southerly and northerly driveways. Drainage is accomplished by several catch basin field inlets positioned in the lower grassed/landscaped areas off the roadway edge of pavement. The structures on Mercy's side of the road serve to also collect water runoff from Mercy's front yard area, including the sidewalk identified above. The installation of curbing along the Mercy road frontage would require significant modifications for drainage.

Other Topics

Street Trees: Gorrill Palmer and Mark Johnson of SMRT have exchanged messages with Jeff Tarling regarding the installation of new tree plantings along the Parkway. We expect to meet with Mr. Tarling during the week of February 10th in order to review new planting locations and species selection. We can advise the planning staff what the outcome of these discussions are upon completion of our coordination with Mr. Tarling.

Mechanical Equipment Screening for ASC: As discussed at the Planning Board Workshop, Mercy agrees to provide the rooftop HVAC Equipment screening measures on the ASC. Unless required by staff no further information will be provided on this item.

Building Signage: Mercy continues to work on updates to the signage materials and the team is continuing to coordinate with City Staff, including the urban designer on the signage package. Mercy is seeking a condition of approval that will allow continued coordination and staff level review as the site signage undergoes adjustments over time.

Portland Trails: Mercy has conducted several meetings with Portland Trails Staff and we have discussed the landscape enhancements proposed around the wet pond. Mercy's team looks forward to finalizing the easement agreement permanently preserving the proposed pond as part of the overall pedestrian access easement held by Portland Trails. Mercy also looks forward to a continued dialogue with Portland Trail's Staff as Mercy explores more ways to enhance the campus experience for patients, visitors, staff and the general public.

METRO Bus Route: Mercy will continue to work with Greg Jordan and METRO as they refine and formulize their updated transit routing services for the peninsula. Mercy is committed to assisting with the placement of transit stops along Mercy's Fore River Parkway frontage. We continue to update City staff as meetings occur with METRO on this topic.

***Final Plan Documents*:** The site plans have been updated in full and will be uploaded to Eplan for final staff review and inclusion in the Public Hearing materials for consideration by the Planning Board. These plans include the civil plans, the landscape plans and the updated Building elevations.

Summary

On behalf of the Mercy team, we extend our appreciation to City Staff for your cooperation and assistance with the review process. We look forward to the upcoming Public Hearing and Planning Board consideration for an approval action at that time. It is Mercy's goal to immediate submit building permit applications upon Planning Board approval. The current schedule contemplates a sitework construction start in mid-March to allow foundation construction to begin in May or June of 2020.

If you have any questions regarding the materials being submitted, please contact this office.

Sincerely,

GORRILL-PALMER

    e. Dewatering 7
6. Construction Site Logistics Plan 9

DRAFT

Construction Principles

The purpose of this Construction Management plan is to identify, mitigate and plan for all potential impacts throughout the duration of building the Mercy Hospital Fore River campus expansion. Northern Light Health (Mercy Hospital) and Consigli Construction will strive for a seamless, incident free project by means of typical practices used to ensure that public safety and community are at the forefront of priorities.

Throughout this CM plan, we will refer to specific examples of potentially invasive construction practices, traffic control concerns, neighboring building considerations and public safety hazards; as well as measures in which these items will be managed, mitigated and avoided at all cost throughout the project. Along with our subcontractor team members, it is imperative that we have complete participation from all parties affiliated with the project to maintain our strict safety requirements and ensure a quality building for Northern Light Health (Mercy Hospital).

Northern Light is in the process of consolidating their services and facilities to the Fore River campus. Consigli Construction has been commissioned to aid in the development of a 50,000 square foot 4-story addition to the existing hospital that will allow for new emergency department, nuclear imaging, observations suite and inpatient units. In addition, Northern Light Health will construct a new 35,000 square foot 2-story standing ambulatory surgery center to accommodate wound care, endoscopy/GI and outpatient surgery. A 12,000 square foot renovation of the adjacent Medical Office Building for imaging, pain, cardiology and administrative spaces is also planned.

Consigli has planned the project's schedule, site logistics and safety protocols that will be covered in this report with graphics and narratives. This CM plan will be updated to meet the needs of the project, community and the city as the project progresses. We aim to deliver a safe and quality project to Northern Light Health, their employees and the City of Portland by means of communication, teamwork and stewardship.

DRAFT

Construction Administration and Communication

Consigli Construction will be the Construction Manager on site throughout the duration of the project. As such, there will be a dedicated team of individuals tasked with managing quality, schedule, site logistics and safety. These personnel will be stationed on site to manage and enforce the proposed CMP with all associated subcontractors and material vendors.

Dave Thomas – Project Executive
207-650-8665, dthomas@consigli.com

Chad Whalen – Senior Project Manager
207-446-3341, cwhalen@consigli.com

Brian Campbell – Project Superintendent
207-754-0820, bcampbell@consigli.com

Larry Chouinard – General Superintendent
207-650-5204, lchouinard@consigli.com

Site Communication

Communication will be imperative throughout construction to keep the public informed of the expected changes to site logistics as the project progresses. Site signage will be prominently displayed to show vehicular and pedestrian access around the site.

Continuous reporting and updating of the CMP will be provided for the following activities:

1) Material deliveries, including notice of any oversized loads that may impact public traffic
2) Requests for upcoming off-hours work including weekends and holidays
3) Notice of any upcoming activities that may produce strong noise, vibration or dust that could adversely affect the neighboring communities.

DRAFT

Construction Schedule

Project Work Hours

Construction work hours will be in accordance with section 17-18 of the City of Portland Code of Ordinances.

The project site is located within zoning group C26 – Due to Mercy Hospital's location on Fore River Pkwy, this project will have minimal impact to buildings used for residential purposes. Work hours are planned for Monday – Friday 7:00am – 6:00pm. Should work extend into weekends or holidays, the use of heavy equipment will be kept within the time constraints of the ordinance.

Project Schedule/Logistics

The project is anticipated to be approximately 20 months in duration. Beginning in March 2020, the project will be turned over to Northern Light in November 2021.

Regarding scheduled work to take place within public streets and sidewalks, this work will comply with Section 25-129 – Noise, dust and debris of the City of Portland Code of Ordinances. not Work outside of Mercy Hospital property is not anticipated at this time.

Material Deliveries

The construction projects will require coordination of material deliveries throughout the duration of the project. The following logistical plans show the planned lay-down areas, truck routes and safety protocols that will be in place prior to the start of construction.

1. All construction traffic will enter and exit the site through Fore River Pkwy by the south lot (see attached PDF for reference). This will allow for all construction vehicles to pull straight onto the site without impacting the public right away.

Material Storage and Laydown Areas

All construction staging, laydown and temporary storage will be within the project limits on Mercy property and secured by temporary fencing. Designated areas for storage will allow the site to remain accessible by incoming trucks without causing a queuing affect outside of the fence.

DRAFT

Contractor Parking

At the peak of construction activity, it is anticipated that up to 150 tradespeople will be on site working various trades associated with the building. Tradespeople will be required to park in designated areas within Mercy Hospital property. No offsite contractor parking is anticipated. (See attached site logistics plan)

Fire Protection for Construction Activities

Consigli and its subcontractors will comply with Mercy Hospital safety protocols and will execute the following measures to provide a safe and secure work place:

1) On Site Fuel Storage: The requirement for different flammable liquids will be required throughout construction. A free standing, 30-minute fire-rated enclosure will be built to safely and securely store all flammable liquids and gases. Fueling trucks will be used as needed but under no circumstances be allowed to be parked or stored on site for any extended period.

2) Means of Egress: The construction projects will be permanently equipped with (2) 2-way stair assemblies for means of egress. Our team will also be connecting into the existing emergency egress stairwells in the main hospital. These stairs will be identified with temporary signage throughout construction indicating the floor level and exit path direction

3) Good Housekeeping: Consigli Construction will provide necessary dumpsters for the removal of debris from the site. All subcontractors are responsible for the daily clean-up of their work areas to ensure that no materials or tools are left out over night that could pose a hazard to the building. Daily safety walks by Consigli will be utilized to ensure that all working floors are equipped with an inspected fire extinguisher and clear means of egress in the event of an emergency.

4) On-site Security: The project site will be secured at the end of everyday by means of a temporary, post driven construction fence and scrim. Lockable gates will be located at various locations for site access.

5) Rapid Communication: Evacuation notification will be provided by means of 2-way radios/cellular devises as well as strategically positioned air horns. Upon evacuation of the building all project personnel will report to the muster point location where the

DRAFT

Consigli and all subcontractor foremen will perform accountability checks. Consigli field staff will then be dispatched to all project entry points. Upon arrival of the first responders to the site Consigli will provide and incident briefing.

Public Safety

The construction process will minimally interact with public traffic throughout the duration of the project. Material deliveries have the potential to have minor impact to typical public activity.

Noise

Construction activities throughout the project will create noise that leaves the project site. It is the intent of the project team to limit the exposure to the noise by following section 17-18 of the City of Portland Code of Ordinances. This project site is not located within 500 feet of buildings classified as residential.

Work related to earthwork, foundations and structural steel will likely be the loudest activity experienced during construction. Most of this work will take place in 2020. Recently, many local projects have utilized similar means of construction to much success around Portland.

Dust Control/Air Quality

Maintaining an environmentally conscious project site will be a priority for the project team to ensure safety not only for the neighboring communities but also for the construction workers on site day after day. All soils and debris will be kept within the project limits following Maine DEP erosion control BMPs:

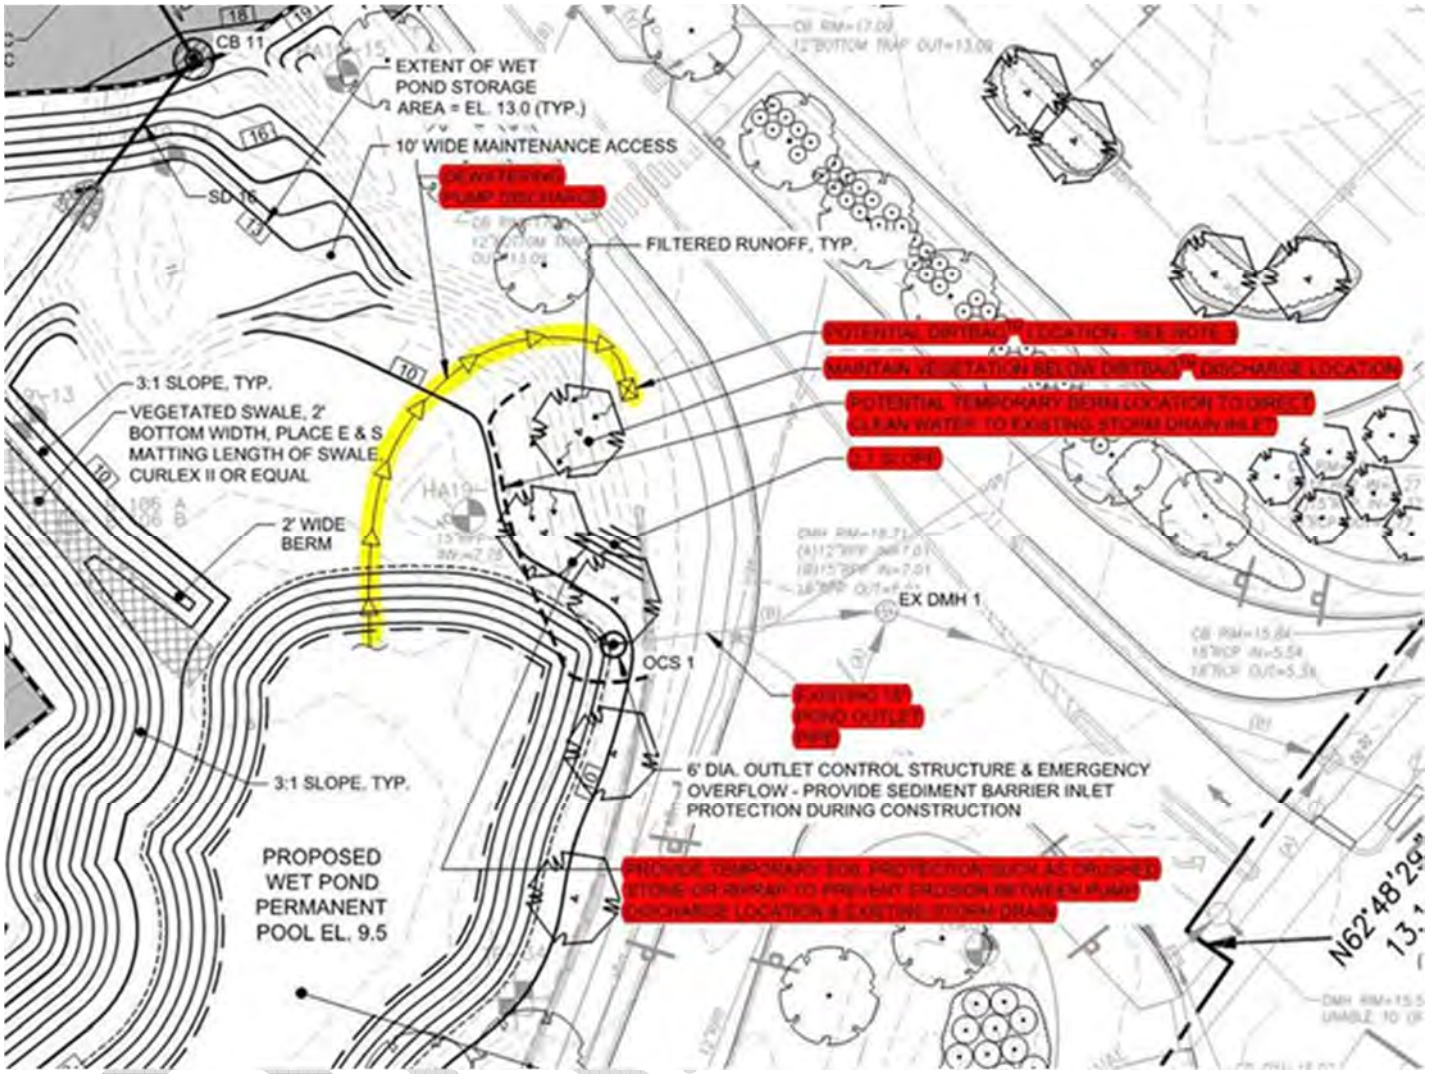
1) Erosion controlled construction entrances
2) Tarped dump trucks leaving the site with soil/debris
3) On-going sidewalk and street cleaning activities
4) The installation of temporary, compacted roads within the job site
5) Using wetting agents to control dust
6) Covering stock piles when material stored is to be piled for long periods of time
7) Smoking will not be allowed on the job site

DRAFT

Vibration Monitoring

Many construction practices required for this project may result in ground vibration waves that transmit to nearby buildings. Prior to any potential vibration causing activities taking place a pre-construction survey will be conducted to review and document existing conditions for structures on Mercy Hospital property.

Construction activities such as vibratory compaction and support of excavation will be monitored diligently by a third-party monitoring company within Mercy Hospital property boundaries.



Traffic Control

The main access point to the construction project will be through the private roads located on the Mercy Hospital campus. All efforts will be made to minimize the impact to traffic flow and patterns to the patients and staff of Mercy Hospital.

Dewatering operation

The projects dewatering operation will be as shown in the below copy from the engineered plans and will not result in any groundwater being introduced into the cities stormwater management system.

GENERAL NOTES:

1. THE CONTRACTOR SHALL REFER TO THE PROJECT MANUAL FOR CONSTRUCTION SPECIFICATIONS AND BIDDING PROCEDURES.
2. THIS PROJECT WILL BE SUBJECT TO THE TERMS AND CONDITIONS OF ALL PERMITS ISSUED BY THE MAINE DEPARTMENT OF ENVIRONMENTAL PROTECTION, THE U.S. DEPARTMENT OF THE ARMY CORPS OF ENGINEERS, LOCAL UTILITY COMPANIES AND THE CITY OF PORTLAND.
3. THE CONTRACTOR SHALL REFER TO THE ARCHITECTURAL PLANS FOR EXACT LOCATIONS AND DIMENSIONS OF THE ENTRANCE, PAVING, PRECISE BUILDING DIMENSIONS, AND EXACT BUILDING UTILITY ENTRANCE POINTS. ENTRANCES IN MOST LOCATIONS REQUIRE STRUCTURAL SLABS. REFER TO THE ARCHITECTURAL AND STRUCTURAL DRAWINGS FOR INFORMATION ON THE STRUCTURAL SLAB ENTRANCES.
4. ALL REQUIRED AND NECESSARY INSPECTIONS AND/OR CERTIFICATIONS REQUIRED BY CODES AND/OR UTILITY SERVICE COMPANIES SHALL BE PERFORMED PRIOR TO ANNOUNCED BUILDING POSSESSIONS AND THE FINAL SERVICE CONNECTIONS.
5. THE CONTRACTOR IS SPECIFICALLY CAUTIONED THAT THE LOCATION AND/OR THE ELEVATION OF THE EXISTING UTILITIES AS SHOWN ON THESE PLANS IS BASED ON RECORDS OF THE VARIOUS UTILITY COMPANIES AND, WHERE POSSIBLE, MEASUREMENTS TAKEN IN THE FIELD. THIS INFORMATION IS NOT TO BE RELIED ON AS BEING EXACT OR COMPLETE. THE CONTRACTOR MUST CALL THE APPROPRIATE UTILITY COMPANY AND DIG SAFE AT LEAST 72 HOURS PRIOR TO ANY EXCAVATION TO REQUEST EXACT FIELD LOCATION OF UTILITIES. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO RELOCATE ALL EXISTING UTILITIES WHICH CONFLICT WITH THE PROPOSED IMPROVEMENTS SHOWN ON THE PLANS.
6. MAINTENANCE OF EROSION CONTROL MEASURES IS OF PARAMOUNT IMPORTANCE TO THE APPLICANT AND THE CONTRACTOR IS RESPONSIBLE FOR COMPLYING WITH ALL EROSION CONTROL MEASURES SHOWN ON THE PLANS. ADDITIONAL EROSION CONTROL MEASURES SHALL BE INSTALLED IF DEEMED NECESSARY BY ONSITE INSPECTIONS OF THE OWNER, THEIR REPRESENTATIVES, OR THE CITY, AT NO ADDITIONAL COST TO THE OWNER.
7. ALL MATERIAL SCHEDULES SHOWN ON THE PLANS ARE FOR GENERAL INFORMATION ONLY. THE CONTRACTOR SHALL PREPARE HIS OWN MATERIAL SCHEDULES BASED UPON HIS PLAN REVIEW. ALL SCHEDULES SHALL BE VERIFIED IN THE FIELD BY THE CONTRACTOR PRIOR TO ORDERING MATERIALS OR PERFORMING WORK.
8. ALL MATERIALS AND CONSTRUCTION METHODS SHALL CONFORM TO THE PROJECT SPECIFICATIONS, THE CITY OF PORTLAND AND SERVICING UTILITY REQUIREMENTS, IN CASES WHERE THESE CONFLICT THE MOST STRINGENT SHALL APPLY AT NO EXTRA COST TO THE OWNER.
9. THE CONTRACTOR IS RESPONSIBLE FOR MAINTAINING RECORD DRAWINGS THROUGHOUT THE PROJECT AND PROVIDING THE OWNER WITH A SET OF THE FINAL RECORD DRAWINGS WHEN THE PROJECT IS COMPLETE.
10. THE CONTRACTOR IS RESPONSIBLE FOR MAINTAINING ACCESS AT ALL TIMES. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ALL TEMPORARY MARKINGS, SIGNAGE AND INCIDENTALS TO MAINTAIN SAFE VEHICLE AND PEDESTRIAN ACCESS THROUGH OUT THE LIFE OF THE PROJECT.

SITE LAYOUT NOTES:

1. ALL HANDICAP PARKING SPACES ARE TO RECEIVE HANDICAP SIGNS AND PAVEMENT MARKINGS AS ILLUSTRATED ON THE DETAIL SHEETS.
2. BITUMINOUS CONCRETE CURB AND GRANITE CURB SHALL MEET THE REQUIREMENTS OF MDOT 702.01, 703.07, AND 609.04.
3. ALL DIMENSIONING, UNLESS NOTED OTHERWISE, IS TO THE FACE OF CURB OR THE FACE OF THE BUILDING.
4. EXCEPT WHERE INDICATED OTHERWISE, THE PAVEMENT IS TO BE STANDARD DUTY PAVEMENT.
5. ALL TRAFFIC CONTROL SIGNS INDICATED ON THE SITE LAYOUT PLAN ARE TO MEET ALL REQUIREMENTS AND STANDARDS OF THE MAINE DEPARTMENT OF TRANSPORTATION, AND THE MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES, LATEST EDITIONS AND THE AMERICANS WITH DISABILITIES ACT REQUIREMENTS.
6. STRIPE PARKING AREAS, DRIVES AND ROADWAY AS SHOWN, INCLUDING PARKING SPACES, STOP BARS, CROSSWALKS, HANDICAP SYMBOLS, PAINTED ISLANDS AND FIRE LANES. (ALL MARKINGS EXCEPT MEDIAN ISLANDS AND CENTERLINES TO BE CONSTRUCTED USING WHITE TRAFFIC PAINT.) ALL TRAFFIC PAINT SHALL MEET THE REQUIREMENTS OF AASHTO M248 TYPE 'F'. MEDIAN ISLANDS AND CENTERLINES TO BE CONSTRUCTED USING YELLOW TRAFFIC PAINT.
7. SEE DETAILS FOR PARKING STALL DIMENSIONS, HANDICAP SYMBOLS, SIGNS AND SIGN POSTS.
8. STOP BARS SHALL BE 12" WIDE.
9. PAINTED ISLANDS SHALL BE 4" WIDE DIAGONAL LINES @ 3'-0" O.C. BORDERED BY 4" WIDE LINES.

GRADING & DRAINAGE NOTES:

1. ALL STORM DRAIN PIPE SHALL BE SMOOTH BORE INTERIOR PROVIDING A MANNINGS ROUGHNESS COEFFICIENT OF n = 0.013 OR LESS.
2. PROVIDE TURF REINFORCEMENT IN AREAS INDICATED ON THE PLANS.
3. AN "AS-BUILT" CERTIFICATION OF THE STORMWATER DRAINAGE SYSTEM BY A REGISTERED ENGINEER IS REQUIRED PRIOR TO THE OWNER ACCEPTING THE BUILDING AND PROPERTY. THE CONTRACTOR IS SPECIFICALLY CAUTIONED THAT ANY DEVIATION FROM THE PLANS MAY DELAY THE ACCEPTANCE OF THE PROJECT.
4. A DETAILED O&M MANUAL FOR STORMWATER MANAGEMENT SYSTEMS IS (WILL BE) FILED WITH THE CITY OF PORTLAND AND MAINE DEPARTMENT OF ENVIRONMENTAL PROTECTION DURING THE PERMIT REVIEW PROCESS. A SPECIFIC MANUAL HAS BEEN PREPARED FOR O&M OF THE DRAINAGE SYSTEM. REFER TO SECTION 12 OF THE MEDEP SITE LOCATION OF DEVELOPMENT PERMIT APPLICATION.
5. SEE EXISTING CONDITIONS FOR BENCHMARK INFORMATION.
6. SEE GRADING, DRAINAGE AND EROSION/SEDIMENT CONTROL FOR PROPOSED GRADING AND EROSION CONTROL MEASURES.
7. ALL DISTURBED AREAS NOT TO BE PAVED, SODDED OR OTHERWISE TREATED SHALL RECEIVE 4" LOAM, SEED, FERTILIZER AND MULCH.
8. COMPACTION REQUIREMENTS:

LOCATION	MINIMUM COMPACTION
SUBBASE AND BASE GRAVEL BELOW PAVED OR CONCRETE AREAS	95%
SUBGRADE FILL BELOW PAVED AREAS	90%
TRENCH BEDDING MATERIAL AND SAND BLANKET BACKFILL	95%
BELOW LOAM AND SEED AREAS	90%
STRUCTURAL FILL WITHIN PROPOSED BUILDING AREA	95%
SELECT FILL ADJACENT BUILDING FOUNDATIONS, EXTERIOR FOUNDATIONS, AND WITHIN 8 INCHES OF THE SLAB-ON-GRADE	95%

*ALL PERCENTAGES OF COMPACTION SHALL BE OF THE MAXIMUM DRY DENSITY AT THE OPTIMUM MOISTURE CONTENT AS DETERMINED AND CONTROLLED IN ACCORDANCE WITH ASTM D-1557.

8. ADJUST ALL MANHOLES, CATCH BASINS, CURB BOXES, ETC. WITHIN LIMITS OF WORK TO FINISH GRADE.
9. CONTRACTOR SHALL PROVIDE A FINISH PAVEMENT SURFACE FREE OF LOW SPOTS AND PONDING AREAS. CRITICAL AREAS INCLUDE BUILDING ENTRANCE AND EXIT RAMPS ADJACENT TO THE BUILDING AND ALONG NEW CURBED AREAS. ALL ADA COMPLIANT PARKING SPACES SHALL BE PAVED WITH A MAXIMUM SLOPE OF 2% IN ANY DIRECTION.
10. PROVIDE STABILIZATION OR SEPARATION GEOTEXTILE FABRIC OVER WETLAND AREAS TO BE FILLED OR OVER UNSTABLE SOILS AS DIRECTED BY THE OWNER'S REPRESENTATIVE AND IN ACCORDANCE WITH THE FINAL GEOTECHNICAL RECOMMENDATIONS.
11. NATIVE SOILS RANGE FROM GRANULAR TO CLAYEY AND SILTY. CARE MUST BE EXERCISED TO LIMIT DISTURBANCE OF THE BEARING SOILS. THE NATIVE CLAYEY OR SILTY SOILS SHOULD NOT BE PROOF-ROLLED. SHOULD THE SUBGRADE BECOME YIELDING OR DIFFICULT TO WORK, DISTURBED AREAS SHOULD BE EXCAVATED AND BACKFILLED WITH COMPACTED SELECT FILL OR CRUSHED STONE AT NO EXTRA EXPENSE TO THE OWNER.
12. FIVE (5.0) FEET OF CLEAN GRANULAR SOIL MEETING THE SELECT FILL GRADATION SPECIFICATIONS SHALL BE PROVIDED BELOW THE ENTRANCE SLABS AND ADJACENT SIDEWALKS. GRADUAL TRANSITION (3 HORIZONTAL TO 1 VERTICAL) OF SELECT FILL THICKNESS SHALL BE PROVIDED FROM THE 5.0 FOOT DEPTH TO THE GRAVEL BASE THICKNESS AT THE SIDEWALKS AND PAVED AREAS AWAY FROM THE BUILDINGS.

LOCAL APPROVALS, WAIVERS, AND VARIANCES:
(ADDITIONAL INFORMATION TO BE PROVIDED UPON RECEIPT OF APPROVALS)

THE CONSTRUCTION PLANS ARE TO BE SUBMITTED TO THE CITY OF PORTLAND FOR THEIR REVIEW AND APPROVAL.

UTILITY NOTES:

1. ALL REQUIRED UTILITIES SERVING THE PROJECT SHALL BE COORDINATED AND CONSTRUCTED BY THE DIVISION 2 CONTRACTOR TO WITHIN 5 FEET OF THE BUILDINGS, AT A LOCATION COORDINATED WITH THE DIVISION 15 OR 16 CONTRACTOR AND THE BUILDING PLANS. DIVISION 2 WORK WITHIN 5 FEET OF UNDERSLAB UTILITIES SHALL CONSIST OF TRENCHING AND BACKFILLING. ACTUAL UTILITY INSTALLATION SHALL BE BY THE DIVISION 15/16 CONTRACTOR. ALL REQUIRED CONNECTION FEES SHALL BE PAID BY THE GENERAL CONTRACTOR.
2. THE CONTRACTOR SHALL COORDINATE THE INSTALLATION OF AND/OR RELOCATION OF OVERHEAD AND UNDERGROUND TELEPHONE WITH VERIZON. CONTRACTOR SHALL BE RESPONSIBLE FOR CONDUITS, PULL WIRES, TRENCHING AND BACKFILLING NECESSARY TO COMPLETE THE WORK.
3. ALL SANITARY SEWER WORK SHALL MEET THE STANDARDS OF THE MAINE STATE PLUMBING CODE AND CITY OF PORTLAND PUBLIC WORKS DEPARTMENT.
4. THE CONTRACTOR SHALL COORDINATE THE INSTALLATION OF ELECTRIC SERVICE WITH CENTRAL MAINE POWER.
5. COORDINATE ALL UTILITY WORK WITH THE APPROPRIATE UTILITY COMPANY. ALL UTILITY WORK SHALL CONFORM TO THE STANDARDS OF THE UTILITY COMPANY AND PROJECT SPECIFICATIONS.
6. THE LOCATIONS OF THE NEW UTILITY SERVICES AND CONNECTIONS SHALL BE COORDINATED WITH THE SERVING UTILITY COMPANY.
7. UNDERGROUND ELECTRICAL, CONDUIT MATERIAL AND INSTALLATION SHALL CONFORM TO UTILITY COMPANY STANDARDS AND PROJECT SPECIFICATIONS, WHICH EVER IS MORE STRINGENT.
8. ADJUST ALL MANHOLES, CATCH BASINS, CURB BOXES, ETC. WITHIN LIMITS OF WORK TO FINISH GRADE.
9. ALL UNDERGROUND CONDUITS SHALL HAVE NYLON PULL ROPES TO FACILITATE PULLING CABLES.
10. THE CONTRACTOR SHALL OBTAIN, PAY FOR, AND COMPLY WITH ALL REQUIRED PERMITS, ARRANGE FOR ALL INSPECTIONS, AND SUBMIT COPIES OF ACCEPTANCE CERTIFICATES TO THE OWNER PRIOR TO COMPLETION OF THE PROJECT.
11. THE CONTRACTOR SHALL PROVIDE AND INSTALL ALL BOXES, FITTINGS, CONNECTORS, COVER PLATES AND OTHER MISCELLANEOUS ITEMS NOT NECESSARILY DETAILED ON THE DRAWINGS TO RENDER INSTALLATION OF UTILITIES COMPLETE AND OPERATIONAL, AT NO EXTRA EXPENSE TO THE OWNER.
12. A 10 FOOT MINIMUM EDGE TO EDGE HORIZONTAL SEPARATION SHALL BE PROVIDED BETWEEN ALL WATER AND SANITARY SEWER LINES. AN 18 INCH OUTSIDE TO OUTSIDE VERTICAL SEPARATION SHALL BE PROVIDED AT ALL WATER AND SANITARY SEWER CROSSINGS.
13. THE CONTRACTOR SHALL PHASE UTILITY CONSTRUCTION AND PROVIDE TEMPORARY SERVICES AS REQUIRED TO PROVIDE CONTINUOUS SERVICE TO THE JOBSITE. TEMPORARY SERVICES SHALL COMPLY WITH ALL FEDERAL, STATE, LOCAL AND UTILITY COMPANY STANDARDS. COORDINATE ALL TEMPORARY SERVICES WITH UTILITY COMPANY, OWNER AND AFFECTED BUSINESSES.

LANDSCAPE NOTES:

(SUBJECT TO COORDINATION WITH LANDSCAPE DRAWINGS. IN CASE OF CONFLICT, THE LANDSCAPING DRAWINGS SHALL GOVERN.)

1. ALL PLANTS SHALL BE NURSERY GROWN AND WORKMANSHIP SHALL CONFORM TO THE AMERICAN ASSOCIATION OF NURSERYMEN, STANDARDS AND SHALL BE SUBJECT TO THE APPROVAL OF THE OWNERS REPRESENTATIVE BEFORE AND AFTER PLANTING.
2. PLANTS SHALL BE GUARANTEED FOR A PERIOD OF ONE (1) YEAR AFTER INSPECTION AND ACCEPTANCE, AND SHALL HAVE AT LEAST 80% HEALTHY GROWTH AT THE END OF THE GUARANTEED PERIOD.
3. ALL DISTURBED AREAS NOT TO BE PAVED OR OTHERWISE TREATED SHALL RECEIVE 4" LOAM AND SEED.
4. THREE (3) INCH BARK MULCH IS TO BE USED AROUND THE TREE AND SHRUB PLANTING AS SPECIFIED IN THE DETAILS. WHERE BARK MULCH IS USED IN A CURBED ISLAND, THE BARK SHALL MEET THE TOP INSIDE EDGE OF THE CURB. ALL OTHER AREAS SHALL RECEIVE 4" LOAM AND SEED.
5. THE CONTRACTOR SHALL SUPPLY ALL PLANT MATERIALS IN QUANTITIES SUFFICIENT TO COMPLETE THE PLANTING AS SHOWN.
6. PARKING AREA PLANTED ISLANDS TO HAVE A MINIMUM OF 4" TOPSOIL. REMOVE ALL CONSTRUCTION DEBRIS BEFORE TOPSOILING. TOPSOIL SHALL BE PLACED TO TOP OF CURB.
7. ALL PLANT MATERIAL SHALL BE APPROVED BY THE OWNER OR THE OWNERS REPRESENTATIVE PRIOR TO ARRIVAL ON THE SITE.
8. PLANT MATERIAL SHALL BEAR THE SAME RELATIONSHIP TO FINISHED GRADE AS TO THE ORIGINAL PLANTING GRADE PRIOR TO DIGGING.
9. THE CONTRACTOR SHALL LOCATE, VERIFY, AND MARK ALL EXISTING AND NEWLY INSTALLED UNDERGROUND UTILITIES PRIOR TO ANY LAWN WORK OR PLANTING. ANY CONFLICTS WHICH MIGHT OCCUR BETWEEN PLANTINGS AND UTILITIES SHALL BE IMMEDIATELY REPORTED TO THE OWNER SO THAT ALTERNATE PLANTING LOCATIONS CAN BE DETERMINED.
10. NO SUBSTITUTION OF PLANT MATERIALS SHALL BE ALLOWED WITHOUT THE PRIOR WRITTEN APPROVAL OF THE OWNER.
11. THE CONTRACTOR SHALL BE RESPONSIBLE FOR PROTECTING ALL PLANTING AND LAWNS AGAINST DAMAGE FROM ONGOING CONSTRUCTION. THIS PROTECTION SHALL BEGIN AT THE TIME THE PLANT IS INSTALLED AND CONTINUE UNTIL THE FORMAL ACCEPTANCE OF ALL THE PLANTINGS.
12. SEE PLANTING DETAILS FOR WEED BARRIER INFORMATION.
13. ALL PLANTING LOCATED AT THE ENTRANCE TO THE PROJECT OR AT INTERSECTIONS WITHIN THE SITE WILL BE MAINTAINED AND WILL NOT EXCEED 3 FEET IN HEIGHT WITHIN A TRIANGLE FORMED 25' INTO THE DRIVEWAY AND 25' ALONG THE TRAVEL WAY.

EROSION CONTROL NOTES:

1. PRIOR TO BEGINNING ANY LAND DISTURBING ACTIVITIES. CLEARING AND GRADING LIMITS SHALL BE STAKED BY THE CONTRACTOR BASED ON THE LIMITS OF GRADING SHOWN ON THE DRAWINGS AND ACCEPTED BY THE OWNER'S REPRESENTATIVE IN THE FIELD. AFTER THE CLEARING AND GRADING LIMITS HAVE BEEN ACCEPTED, THE CONTRACTOR SHALL INSTALL THE PERIMETER SILT FENCES AND THE CONSTRUCTION ENTRANCES ASSOCIATED WITH THE PROJECT.
2. ALL GROUND AREAS GRADED FOR CONSTRUCTION SHALL BE GRADED, LOAMED, SEEDED AND MULCHED AS SOON AS POSSIBLE. TEMPORARY/PERMANENT SEED MIXTURES SHALL CONFORM TO THE SEEDING PLAN CONTAINED IN THE EROSION CONTROL PROJECT PREPARED FOR THIS PROJECT.
3. PRIOR TO PAVING, THE CONTRACTOR SHALL FLUSH SILT FROM ALL STORM LINES.
4. ALL STORM DRAIN INLETS AND OUTLETS NOT IN PAVED AREAS ARE TO RECEIVE RIPRAP PROTECTION APRONS DURING CONSTRUCTION.
5. SILT FENCES SHALL BE INSPECTED, REPAIRED AND CLEANED AS NOTED IN THE EROSION CONTROL NOTES SHOWN ON THE EROSION CONTROL DETAIL SHEET.
6. THE CONTRACTOR SHALL REPAIR AND ADD STONE TO THE CONSTRUCTION ENTRANCE AS IT BECOMES SATURATED WITH MUD TO ENSURE THAT IT FUNCTIONS TO CAPTURE MUD FROM THE TIRES OF CONSTRUCTION VEHICLES DURING CONSTRUCTION. THE PURPOSE OF THE CONSTRUCTION ENTRANCE IS TO KEEP ADJACENT STREETS CLEAR OF DIRT AND MUD, SWEEPING OF THE ROADWAYS SHALL BE PERFORMED BY THE CONTRACTOR.
7. SILT REMOVED FROM AROUND INLETS AND BEHIND THE SILT FENCES SHALL BE PLACED ON A TOPSOIL STOCKPILE AND MIXED INTO TOPSOIL FOR USE IN LANDSCAPING OPERATIONS.
8. LAND DISTURBING ACTIVITIES SHALL BE ACCOMPLISHED IN A MANNER AND SEQUENCE WHICH CAUSE THE LEAST PRACTICAL UNPROTECTED DENUDED AREAS ON THE SITE DURING CONSTRUCTION.
9. THE CONTRACTOR IS CAUTIONED THAT FAILURE TO COMPLY WITH THE SEQUENCE OF CONSTRUCTION, EROSION / SEDIMENT CONTROL PLAN, AND OTHER PERMIT REQUIREMENTS MAY RESULT IN MONETARY PENALTIES AS ENFORCED BY THE MEDEP OR LOCAL AGENCIES. THE CONTRACTOR SHALL BE ASSESSED ALL SUCH PENALTIES AT NO COST TO THE OWNER OR PERMITTEE.
10. A FULL EROSION/SEDIMENTATION CONTROL PLAN ACCOMPANIES THIS DRAWING SET AND IS ALSO CONTAINED IN THE DIV 2 SPECIFICATIONS.
11. PROVIDE INLET PROTECTION BARRIERS AROUND ALL EXISTING AND PROPOSED STORM DRAINAGE INLETS AS SHOWN AND MAINTAIN FOR THE DURATION OF THE PROJECT UNTIL PAVEMENT HAS BEEN INSTALLED.
12. INSPECT EROSION AND SEDIMENT CONTROL DEVICES AFTER EACH RAIN STORM OF 0.25 INCH OR GREATER. REPAIR/MODIFY PROTECTION AS NECESSARY TO MAXIMIZE EFFICIENCY FILTER. REPLACE ALL FILTERS WHEN SEDIMENT IS $\frac{1}{3}$ THE STRUCTURE HEIGHT.
13. INSTALL CURLEX EROSION CONTROL MAT OR EQUAL ON ALL SLOPES STEEPER THAN 3:1.
14. THE CONTRACTOR SHALL INSTALL ALL EROSION CONTROL MEASURES IN ACCORDANCE WITH THE "MAINE EROSION & SEDIMENT CONTROL HANDBOOK FOR CONSTRUCTION: BEST MANAGEMENT PRACTICES, CUMBERLAND COUNTY SOIL AND WATER CONVERSATION DISTRICT AND MAINE DEPARTMENT OF ENVIRONMENTAL PROTECTION, MARCH 1991"

CITY OF PORTLAND
SPACE AND BULK REQUIREMENTS

1. EXISTING ZONE: CONTRACT ZONE AGREEMENT
2. PARCEL SIZE (TO MEAN HIGH WATER): 33.51 ACRES±
3. SPACE AND BULK:

	REQUIRED	PROVIDED (UPON COMPLETION OF PHASE II)

Utility Note:

THE UNDERGROUND UTILITIES SHOWN HAVE BEEN LOCATED FROM FIELD SURVEY INFORMATION AND EXISTING DRAWINGS. THE SURVEYOR MAKES NO GUARANTEES THAT THE UNDERGROUND UTILITIES SHOWN COMPRISE ALL SUCH UTILITIES IN THE AREA, EITHER IN SERVICE OR ABANDONED. THE SURVEYOR FURTHER DOES NOT WARRANT THAT THE UNDERGROUND UTILITIES SHOWN ARE IN THE EXACT LOCATION INDICATED ALTHOUGH HE DOES CERTIFY THAT THEY ARE LOCATED AS ACCURATELY AS POSSIBLE FROM INFORMATION AVAILABLE. THE SURVEYOR HAS NOT PHYSICALLY LOCATED THE UNDERGROUND UTILITIES. CALL 1-888-DIGSAFE AT LEAST THREE BUSINESS DAYS BEFORE PERFORMING ANY CONSTRUCTION. DUE TO OSHA CONFINED SPACE REQUIREMENTS, ALL INVERTS AND PIPE SIZES MUST BE VERIFIED PRIOR TO ANY CONSTRUCTION.

SCALE : 1" = 50'

0' 25' 50' 100'

Notes:

1. THERE IS ACCESS TO THE SUBJECT PROPERTY PER AN INGRESS AND EGRESS EASEMENT SET FORTH IN VOLUME 24969, PAGE 25 FROM FORE RIVER PARKWAY, A.K.A. I-295 CONNECTOR, A PUBLIC RIGHT-OF-WAY.
2. BEARINGS ARE GRID NORTH (MAINE STATE COORDINATE SYSTEM WEST ZONE) BASED ON MARKERS FOUND ON PLAN REFERENCE 4.
3. ELEVATIONS ARE BASED ON NGVD 1929.
4. MEDICAL OFFICE BUILDING TOTAL LEASE PARCEL AREA = 3.88 ACRES.
5. TOTAL AREA OF PROPERTY TO MEAN HIGH WATER IS 33.51 ACRES ±.
6. UNDERGROUND UTILITIES WERE MARKED BY CENTERLINE UTILITY LOCATING. GAS LINE LOCATION WAS NOT MARKED, ITS LOCATION HAS BEEN TAKEN FROM PLAN REFERENCE 22.

A CONIFER INSTALLATION DETAIL
N.T.S.

E TREE INSTALLATION DETAIL: <10' HT.
N.T.S.

I SOD PLACEMENT DETAILS (IF SOD IS USED IN LIEU OF LOAM & SEED)
N.T.S.

SPECIFICATIONS

SITE PREPARATION
(a) INSTALL NEEDED WATER CONTROL MEASURES.
(b) GRADE SLOPES 2:1 OR FLATTER.
(c) BEFORE LAYING SOD, PROVIDE ADEQUATE DRAINAGE WHERE INTERNAL WATER MOVEMENT, ESPECIALLY AT THE TOE OF SLOPES, MAY CAUSE SEEPS OR SOIL SLIPPAGE.

SOIL PREPARATION
(a) PROVIDE THE BEST POSSIBLE SOIL CONDITIONS FOR SODDING. THE DESIRABLE SOIL TEXTURES INCLUDE SANDY LOAM, LOAM, AND SILT LOAM. WHERE DROUGHTY OR CLAYEY SOILS ARE ENCOUNTERED, CONSIDER AMENDING THEM WITH IMPORTED MATERIALS (TOPSOIL, COMPOST, SAND, ETC.) TO IMPROVE MOISTURE AND NUTRIENT RETENTION AND DRAINAGE. RESPREAD SCREENED NATIVE TOPSOIL (WHEN AVAILABLE) AFTER GRADING.

(b) IF TIME PERMITS, HAVE SOILS TESTED AND FOLLOW LIME AND FERTILIZER RECOMMENDATIONS.

(c) FILL AREAS MUST BE COMPACTED ENOUGH TO PREVENT UNEVEN SETTLING. THE ENTIRE SURFACE TO BE SODDED SHALL BE FREE FROM LARGE CLODS, STONES, OR OTHER DEBRIS. AT THIS STAGE, INCORPORATE LIME AND FERTILIZER UNIFORMLY INTO THE SURFACE SOIL AS NEEDED. IMMEDIATELY BEFORE SODDING, THE SOIL SHALL BE LOOSENED TO A DEPTH OF 1 INCH AND THOROUGHLY DAMPENED, IF NOT ALREADY MOIST. SOD SHALL NOT BE LAID ON DRY SOIL. THE LAST TILLAGE OPERATION SHOULD BE PERFORMED ACROSS THE SLOPE WHENEVER PRACTICAL.

SELECTION OF SOD
(a) SELECT SOD GROWN FROM SEED OF ADAPTED VARIETIES OR TYPES AND UNDER CULTURAL PRACTICES CONDUCIVE TO HIGH QUALITY SOD FREE OF THATCH, WEED, INSECT, DISEASE, AND OTHER PEST PROBLEMS.

(b) SELECT SPECIES AND VARIETIES BEST SUITED FOR THE SITES TO BE STABILIZED.

(c) SELECT SOD AT LEAST 15 MONTHS OLD AND NO OLDER THAN 3 YEARS. CULTIVATED TURF GRASS IS USUALLY CONSIDERED READY FOR HARVEST WHEN A CUT PORTION OF SOD 3 FEET LONG BY 1 TO 1 1/2 FEET WIDE WILL SUPPORT ITS OWN WEIGHT WHEN SUSPENDED VERTICALLY FROM THE UPPER 10 PERCENT OF THE SECTION. THE MOST COMMON AGE OF SOD WHEN CUT IS 15 TO 24 MONTHS.

(d) SELECT SOD CUTS OF WIDTH AND LENGTH SUITED TO THE PROJECT AND AVAILABLE EQUIPMENT. GENERALLY, SOD PIECES ARE 12 TO 24 INCHES WIDE, AVERAGING 18 INCHES IN WIDTH. LENGTHS OF PIECES VARY FROM 4 TO 8 FEET. SOD MAY BE CUT AND ROLLED OR FOLDED IN THE MIDDLE AND STACKED ON PALLETS. FOLDED SOD IS CUT SHORTER THAN ROLLED SOD - ABOUT 3 TO 4 FEET IN LENGTH. SOD SHOULD BE CUT WITH A 1/4 TO 1/2 INCH LAYER OF SOIL. ABOUT 80 PERCENT OF ALL RHIZOMES ARE IN THE TOP 3/4 INCH OF SOIL. THE THINNER THE SOD IS CUT THE MORE QUICKLY IT WILL KNIT TO THE SITE SOIL, BUT THE SOIL LAYER MUST BE THICK ENOUGH TO HOLD CUT PIECES TOGETHER WITHOUT FALLING APART.

(e) HAVE SOD DELIVERED TO THE SITE AS SOON AS PRACTICAL AFTER LIFTING. DURING HOT WEATHER, DELIVERY SHOULD BE MADE WITHIN 6 HOURS AND MAY BE EXTENDED TO 48 HOURS DURING COOL SEASONS. IT IS GENERALLY UNWISE TO MOVE SOD DURING JULY AND AUGUST. IF MOVED DURING THIS PERIOD, SOD MAY NEED TO BE CUT THICKER AND IT WILL REQUIRE FREQUENT IRRIGATION.

ESTABLISHMENT
(a) DATES: SOD CAN BE ESTABLISHED FROM APRIL 1st TO NOVEMBER 15th (MAY VARY WITH REGION OF STATE).

(b) LAY STRIPS OF SOD AT RIGHT ANGLES TO DIRECTION OF SLOPE OR FLOW OF WATER STARTING AT THE LOWEST ELEVATION. WEDGE THE EDGES AND ENDS OF THE SOD STRIPS TOGETHER AND TAMP OR ROLL. STAGGER JOINTS. LAY SO THE TOP OF THE SOIL LAYER IS FLUSH WITH THE TOP OF THE UNDISTURBED GROUND OR PAVEMENT SURFACE.

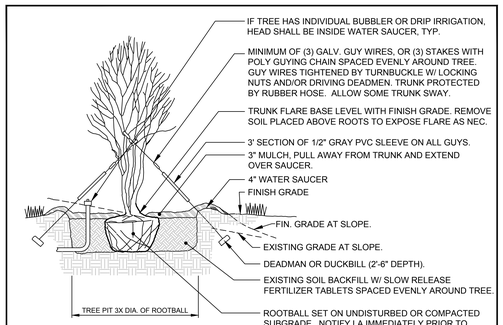
(c) USE WIRE STAPLES, FINE MESH WIRE OR WOOD PINS AND BINDER TWINE ON VERY STEEP SLOPES TO HOLD SOD IN PLACE UNTIL SECURED BY PLANT GROWTH.

(d) IRRIGATE SODDED AREA IMMEDIATELY AFTER INSTALLATION. IF UNFAVORABLE DRY WEATHER OR OTHER CONDITIONS PREVAIL, ADDITIONAL WATERING WILL SUBSEQUENTLY BE REQUIRED. IT MAY ALSO BE DESIRABLE TO IRRIGATE AREA FROM WHICH SOD IS TO BE REMOVED PRIOR TO LIFTING.

SODDED WATERWAYS
(a) CARE SHALL BE TAKEN TO PREPARE THE SOIL ADEQUATELY IN ACCORDANCE WITH THE SPECIFICATIONS. THE SOD TYPE SHALL CONSIST OF PLANT MATERIALS ABLE TO WITHSTAND THE DESIGNED VELOCITY.

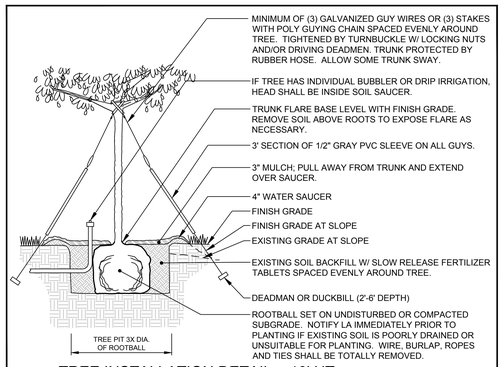
(b) SOD STRIPS IN WATERWAYS SHALL BE LAID PERPENDICULAR TO THE DIRECTION OF FLOW (FIGURE 4.2). CARE SHOULD BE TAKEN TO BUTT ENDS OF STRIPS TIGHTLY.

(c) AFTER ROLLING OR TAMPING, SOD SHALL BE PEGGED OR STAPLED TO RESIST WASHOUT DURING THE ESTABLISHMENT PERIOD. CHICKEN WIRE, JUTE OR OTHER NETTING MAY BE PEGGED OVER THE SOD FOR EXTRA PROTECTION IN CRITICAL AREAS.



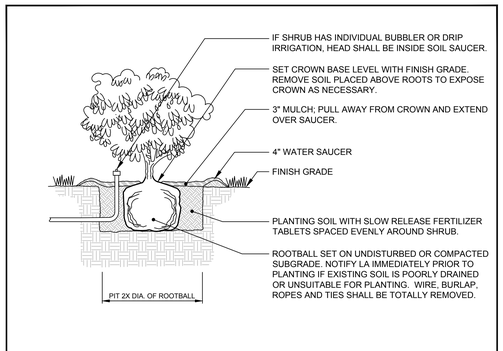
(d) ALL OTHER SPECIFICATIONS FOR THIS PRACTICE SHALL BE ADHERED TO WHEN SODDING A WATERWAY.

TIMING
WHEN SOD IS INSTALLED TO STABILIZE AREAS OF CONCENTRATED FLOW (INLETS, DIVERSIONS, DITCHES, ETC.), INSTALLATION MUST BE COMPLETED BEFORE RUNOFF IS DIRECTED TO THAT AREA.

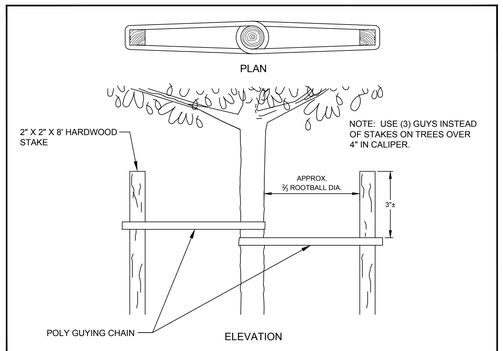


MAINTENANCE
(a) AFTER THE FIRST WEEK, SOD SHALL BE WATERED AS NECESSARY TO MAINTAIN ADEQUATE MOISTURE IN THE ROOT ZONE AND PREVENT DORMANCY OF SOD.

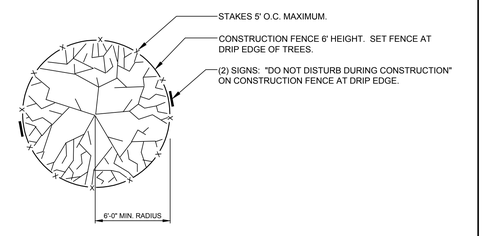
(b) NO MORE THAN 1/3 OF THE SHOOT (GRASS LEAF) SHOULD BE REMOVED IN ANY MOWING. GRASS HEIGHT SHOULD BE MAINTAINED BETWEEN 2 AND 3 INCHES UNLESS OTHERWISE SPECIFIED.



(c) AFTER THE FIRST GROWING SEASON, ESTABLISHED SOD WILL REQUIRE FERTILIZATION AND MAY REQUIRE LIME. FOLLOW SOIL TEST RECOMMENDATIONS.



B MULTI-TRUNKED TREE INSTALLATION DETAIL
N.T.S.



F TREE INSTALLATION DETAIL: >10' HT.
N.T.S.

C SHRUB INSTALLATION DETAIL
N.T.S.

G POLY GUYING DETAIL
N.T.S.

D TREE PROTECTION DETAIL
N.T.S.

H VACANT
N.T.S.

1. PLANTING OF TREES AND SHRUBS SHALL NOT OCCUR UNTIL ALL GRADING AND PAVING IS COMPLETED IN THE AREA.
2. ALL PLANTS SHALL HAVE A NORMAL HABIT OF GROWTH FOR THE SPECIES AND SHALL BE SOUND, HEALTHY AND FREE OF DISEASE AND INSECTS. THEY SHALL CONFORM TO THE SIZE SPECIFICATION INDICATED ON THE PLANT LIST AND SHALL CONFORM TO ANSI Z60.1 - NURSERY STOCK, LATEST REVISION.
3. ALL PLANTS SHALL HAVE ALL ROOTBALL WRAPPING MATERIALS (BURLAP, WIRE, STRING, ROPE, POTS, ETC.) REMOVED AT THE TIME OF PLANTING. REMOVE SOIL PLACED ABOVE ROOTS TO EXPOSE TRUNK FLARE AS NECESSARY TO DETERMINE SETTING LEVEL AND PIT DEPTH. CIRCLING ROOTS OR ROOTS THAT WOULD LATER GIRDLE THE PLANT SHALL BE STRAIGHTENED OR CUT OR THE ROOT BALL SHALL BE CUT UTILIZING THE "BUTTERFLY METHOD".
4. BACKFILL MIX FOR ALL PLANT MATERIAL, EXCEPT TREES, SHALL BE COMPOSED OF TWO PARTS EXISTING SOIL AMENDED WITH ONE PART COMPOST OR TOPSOIL, OR WITH ONE PART SANDY FILL IF HEAVY SOILS. TREE PITS SHALL BE BACKFILLED WITH EXISTING SOIL. PLANTING PITS SHALL BE EXCAVATED TO TWICE THE DIAMETER AND TO THE SAME DEPTH OF THE PLANT ROOT BALL. BACKFILL 1/2 OF DEPTH OF PIT AT A TIME AND COMPACT. REFER TO FERTILIZER RATES AND INSTALL SLOW RELEASE FERTILIZER AFTER FIRST BACKFILL LIFT.
5. ALL PLANTINGS SHALL HAVE SLOW RELEASE FERTILIZER TABLETS INSTALLED. TABLETS SHALL BE AGRIFORM 21-GRAM 20-10-5 PLANTING TABLETS OR AN APPROVED EQUAL. APPLICATION RATE: PERENNIALS - 1 TABLET/PLANT, WOODY SHRUBS TO 3'-0" - 2 TABLETS/PLANT, SHRUBS AND TREES 3'-0" TO 6'-0"-3 TABLETS/PLANT AND TREES 6'-0" AND ABOVE - 4 TABLETS/PLANT. AFTER PLANTS ARE INSTALLED, LIQUID FEED ALL PLANTS WITH ROOTS OR AN APPROVED EQUAL. MIX ACCORDING TO MANUFACTURERS INSTRUCTIONS. APPLICATION RATE: PERENNIALS - 2 QT/PLANT, WOODY SHRUBS TO 4'-0" - 1.5 GAL/PLANT, TREES AND SHRUBS 4'-0" TO 10'-0" 3.0 GAL/PLANT AND TREES 10' AND ABOVE - 4.0 GAL/PLANT.
6. ALL TREES REQUIRE A MINIMUM OF 2 STAKES EACH AND ALL SHALL BE GUYED OR STAKED. TREE STAKING MATERIAL SHALL BE REMOVED BY THE LANDSCAPE CONTRACTOR AFTER ONE GROWING SEASON.
7. ALL SHRUB PLANTINGS ARE IN MULCHED BEDS. ALL PLANTING BEDS SHALL BE FREE OF WEEDS OR GRASS PRIOR TO INSTALLATION OF MULCH. IF VEGETATION EXISTS, TREAT WITH HERBICIDE. MULCH SHALL BE MEDIUM SHREDDED BARK, 3" DEPTH. ALL PLANTINGS NOT IN BEDS OR ISLANDS SHALL HAVE MULCHED WATER RINGS ACCORDING TO THE DETAIL.
8. ALL PLANTS SHALL HAVE THEIR LOCATIONS STAKED AND APPROVED BY THE LANDSCAPE ARCHITECT OR OWNER PRIOR TO PLANT INSTALLATION. ALL PLANTS SHALL BE ORIENTED FOR BEST APPEARANCE.
9. PLANT SPECIES SUBSTITUTIONS WILL NOT BE ALLOWED UNLESS FIRST APPROVED BY THE LANDSCAPE ARCHITECT, OWNER, AND MUNICIPAL AUTHORITY (IF APPLICABLE). ANY CHANGE TO PLANT SPECIES, DUE TO LACK OF AVAILABILITY DURING CONSTRUCTION, SHALL BE APPROVED BY THE LANDSCAPE ARCHITECT.
10. ALL PLANTS SHALL BE GUARANTEED FOR ONE YEAR FROM DATE OF FINAL ACCEPTANCE BY THE OWNER, OR ONE YEAR FROM STORE GRAND OPENING DATE, WHICHEVER IS LONGER. ANY PLANTS THAT DIE DURING THE GUARANTEE PERIOD SHALL BE REPLACED BY THE CONTRACTOR AT NO COST TO THE OWNER. A WRITTEN WARRANTY, WITH CONTRACTOR'S CONTACT INFORMATION, DATE OF ACCEPTANCE AND LENGTH OF GUARANTEE PERIOD SHALL BE SUBMITTED AS PART OF JOB CLOSEOUT. ANY MATURE TREE WHICH WAS USED TO SATISFY THE REQUIRED NUMBER OF PLANT UNITS WHICH DIES WITHIN FIVE YEARS OF THE ISSUANCE OF THE BUILDING PERMIT SHALL BE REPLACED WITH TWO CANOPY OR EVERGREEN TREES WITHIN ONE GROWING SEASON OF ITS DEATH.
11. ALL AREAS NOT IDENTIFIED WITH OTHER SURFACE TREATMENTS SHALL BE LAWN. THE LAWN AREA SHALL BE LOAMED, SEEDED AND STRAW MULCHED. THE CONTRACTOR SHALL BE RESPONSIBLE FOR LAWN MAINTENANCE. MAINTENANCE SHALL COMMENCE AT THE TIME OF PLANTING AND CONTINUE UNTIL GRASS IS FULL AND ESTABLISHED AND ACCEPTED BY THE OWNER.
12. ALLOW SHRUBS AND ORNAMENTAL GRASSES TO GROW TOGETHER TO FORM A NATURAL LOOKING PLANT MASS AND ALLOW EVERGREEN SHRUBS TO GROW TOGETHER TO FORM A SOLID GROUND COVER.
13. IF QUANTITIES OF PLANTS LISTED IN THE PLANT LIST DO NOT CORRELATE WITH THOSE INDICATED ON THE PLAN, THE QUANTITIES ON THE PLAN SHALL GOVERN.
14. ALL LANDSCAPE ISLANDS SHALL HAVE 12" OF LOAM AND BE SLIGHTLY MOUNDED PER THE DETAIL.
15. REMOVE EXISTING GRASS AND WEEDS FROM ALL AREAS TO BE PLANTED PRIOR TO PLANT INSTALLATION. LOAM, SEED AND STRAW MULCH (OR OTHER SURFACE TREATMENT AS INDICATED) ALL AREAS DISTURBED BY CONSTRUCTION.
16. ALL AREAS NOT IDENTIFIED WITH OTHER SURFACE TREATMENTS SHALL BE SEEDED AND STRAW MULCHED WITH SEED MIXES AS NOTED AND AS DESCRIBED IN THE SPECIFICATIONS:
    a. PRIOR TO SEEDING, APPLY FERTILIZER AND LIME IN ACCORDANCE WITH SOIL TEST RECOMMENDATIONS.
    b. LAWNS: 35% KENTUCKY BLUEGRASS, 35% CREEPING RED FESCUE, 20% CHEWING FESCUE, 10% PERENNIAL RYEGRASS. RATE: 5 LBS/1000 SF.
    c. LOW MAINTENANCE AREAS: 35% TALL FESCUE, 30% CREEPING RED FESCUE, 20% PERENNIAL RYEGRASS, 15% ANNUAL RYEGRASS RATE: 5 LBS/1000 SF.
    d. WETLAND SEED MIX: WETLAND SEED MIX AS DISTRIBUTED BY NE WETLAND PLANTS IN AMHERST, MA. RATE: 0.5 LB/1000 SF.
    e. EROSION CONTROL SEED MIX: EROSION CONTROL SEED MIX AS DISTRIBUTED BY NE WETLAND PLANTS IN AMHERST, MA. RATE: 1 LB/1000 SF.

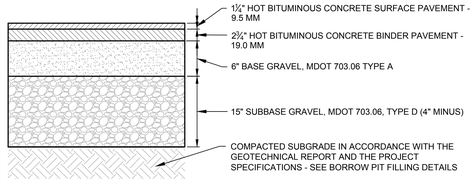
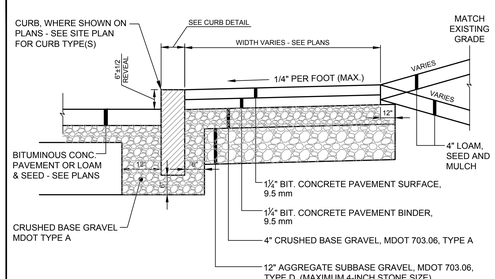
1. MAXIMUM LENGTH OF STRAIGHT CURB STONES = 8'.
2. MINIMUM LENGTH OF STRAIGHT CURB STONES = 4'.
3. CIRCULAR CURB REQUIRED FOR RADIUS LESS THAN 50'.
4. GROUT OR CAULK ALL CURB JOINTS OVER ½" IN WIDTH. INSTALL STRIP OF FILTER FABRIC BEHIND EACH CURB JOINT.

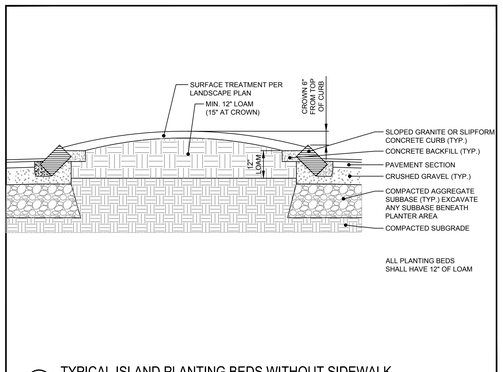


(B) VERTICAL GRANITE CURB DETAIL
N.T.S.

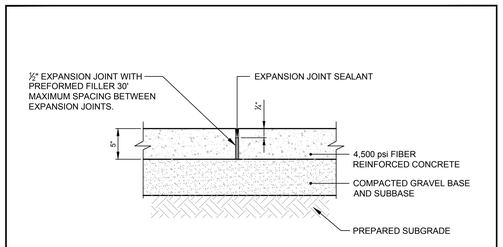


(F) CONCRETE SLAB DETAIL
N.T.S.

NOTES:

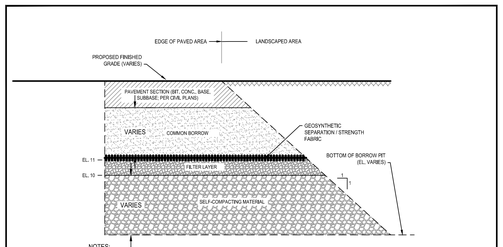


1. SEE OVERALL SITE LAYOUT PLAN (SHEET C-3.1) FOR LOCATION(S) OF DIFFERENT PAVEMENT TYPES.
2. APPLY TACK COAT BETWEEN BINDER AND SURFACE COURSES.
3. ALL MATERIALS SHALL CONFORM TO MDOT SPECIFICATIONS, LATEST REVISION. COMPACTION OF ALL MATERIALS TO BE IN ACCORDANCE WITH THE SPECIFICATIONS AND GEOTECHNICAL REPORTS PREPARED BY THE GEOTECHNICAL ENGINEER, WHICHEVER IS MORE STRINGENT.
4. CONTRACTOR SHALL BE REQUIRED TO PROTECT ALL BEARING SOILS FROM EXCESSIVE DISTURBANCE. SHOULD SUBGRADE BECOME YIELDING OR DIFFICULT TO WORK, DISTURBED AREAS SHOULD BE EXCAVATED AND COMPACTED WITH SELECT GRANULAR FILL OR CRUSHED STONE AT NO EXTRA EXPENSE TO THE OWNER. WOVEN GEOTEXTILE TENSILE FABRIC (MIRAFI 600X OR EQUAL) SHALL BE PLACED OVER UNSUITABLE SUBGRADE AS DIRECTED BY THE OWNER'S REPRESENTATIVE, AT NO EXTRA EXPENSE TO THE OWNER.
5. ALL GRAVELS SHALL EXTEND A MINIMUM OF 12" BEYOND THE EDGE OF PAVEMENT.



(J) HEAVY DUTY BITUMINOUS CONCRETE PAVEMENT SECTION
N.T.S.

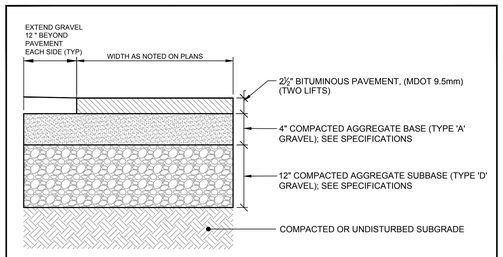
(N) BITUMINOUS SIDEWALK WITH CURB DETAIL
N.T.S.



(C) TYPICAL ISLAND PLANTING BEDS WITHOUT SIDEWALK
N.T.S.

NOTE:
CONCRETE SIDEWALK TO HAVE FINE TO MEDIUM BROOM FINISH PERPENDICULAR TO CURB LINE.

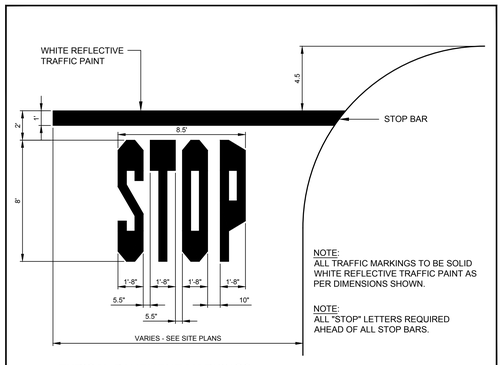
PROVIDE 1/2" WIDE EXPANSION JOINT BETWEEN SIDEWALK AND ALL FIXED OBJECTS.



(G) SIDEWALK EXPANSION JOINT
N.T.S.

NOTES:

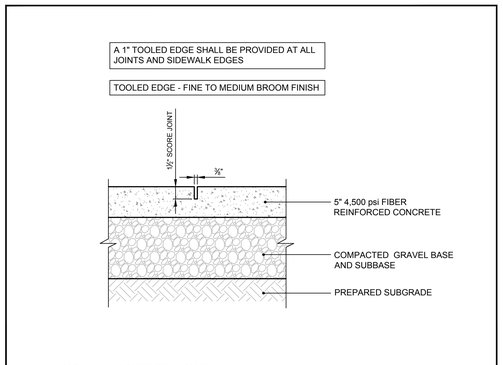
1. COMMON BORROW SHALL MEET THE MATERIAL REQUIREMENTS OF MAINE DOT 703.18 AND SHALL BE PLACED AND COMPACTED IN APPROXIMATE 12-IN. THICK (MAX.) LOOSE LIFTS AND COMPACTED TO 92 PERCENT MAX. DRY DENSITY UP TO 3 FT BELOW PROPOSED FINISHED GRADE. COMMON BORROW PLACED WITHIN 3 FT OF PROPOSED FINISHED GRADE SHALL BE COMPACTED TO 95 PERCENT MAX. DRY DENSITY.
2. "SELF-COMPACTING" MATERIAL SHALL CONSIST OF 2-IN. CRUSHED STONE (MAINE DOT 703.31).
3. GEOSYNTHETIC SEPARATION/STRENGTH FABRIC SHALL CONSIST OF MIRAFI 600X OR APPROVED EQUAL.
4. FILTER LAYER SHALL CONSIST OF 3/4-IN. CRUSHED STONE (MAINE DOT 703.13).



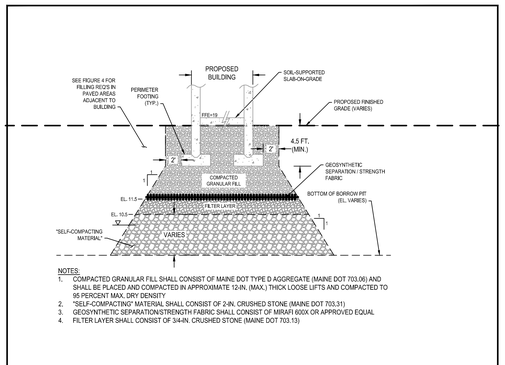
(K) BORROW PIT FILLING DETAIL - BELOW PAVED AREAS
N.T.S.

NOTES:

1. APPLY TACK COAT BETWEEN PAVEMENT COURSES.
2. ALL MATERIALS SHALL CONFORM TO MDOT SPECIFICATIONS, LATEST REVISION.
3. COMPACTION OF ALL MATERIALS TO BE IN ACCORDANCE WITH THE SPECIFICATIONS AND THE GEOTECHNICAL REPORT.



(O) BITUMINOUS ASPHALT SIDEWALK
N.T.S.



NOTE:
ALL TRAFFIC MARKINGS TO BE SOLID WHITE REFLECTIVE TRAFFIC PAINT AS PER DIMENSIONS SHOWN.

NOTE:
ALL "STOP" LETTERS REQUIRED AHEAD OF ALL STOP BARS.

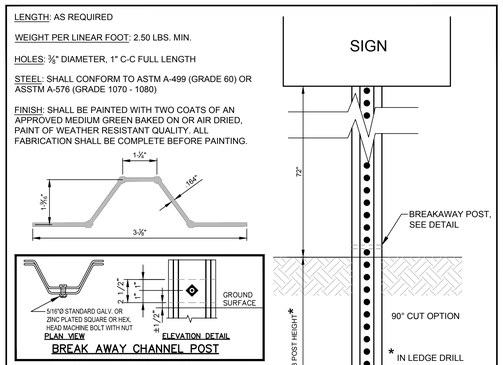
(D) TYPICAL PAVEMENT MARKINGS
N.T.S.

(H) SIDEWALK SCORE JOINT
N.T.S.

NOTES:

1. COMPACTED GRANULAR FILL SHALL CONSIST OF MAINE DOT TYPE D AGGREGATE (MAINE DOT 703.06) AND SHALL BE PLACED AND COMPACTED IN APPROXIMATE 12-IN. (MAX.) THICK LOOSE LIFTS AND COMPACTED TO 95 PERCENT MAX. DRY DENSITY
2. "SELF-COMPACTING" MATERIAL SHALL CONSIST OF 2-IN. CRUSHED STONE (MAINE DOT 703.31)
3. GEOSYNTHETIC SEPARATION/STRENGTH FABRIC SHALL CONSIST OF MIRAFI 600X OR APPROVED EQUAL
4. FILTER LAYER SHALL CONSIST OF 3/4-IN. CRUSHED STONE (MAINE DOT 703.13)

(L) BORROW PIT FILLING DETAIL - BELOW ASC BLDG. FOOTPRINT
N.T.S.



LENGTH: AS REQUIRED

WEIGHT PER LINEAR FOOT: 2.50 LBS. MIN.

HOLES: ⅜" DIAMETER, 1" C-C FULL LENGTH

STEEL: SHALL CONFORM TO ASTM A-499 (GRADE 60) OR ASSTM A-576 (GRADE 1070 - 1080)

FINISH: SHALL BE PAINTED WITH TWO COATS OF AN APPROVED MEDIUM GREEN BAKED ON OR AIR DRIED, PAINT OF WEATHER RESISTANT QUALITY. ALL FABRICATION SHALL BE COMPLETE BEFORE PAINTING.

(P) U-CHANNEL METAL SIGN POST
N.T.S.

NOTE: THIS PLAN SET IS ISSUED FOR PERMITTING PURPOSES & CD PRICING AND SHALL NOT BE USED FOR CONSTRUCTION.

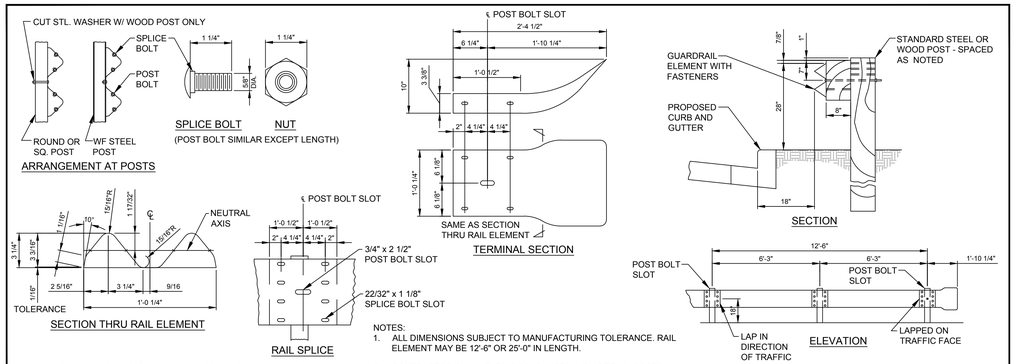
A PREFERRED SIDEWALK RAMP AT INTERSECTION

N.T.S.

AS OBTAINED FROM THE CITY OF PORTLAND "TECHNICAL MANUAL"



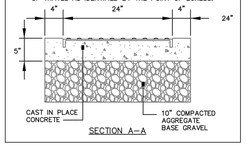
NOTE:

WHEN PARKING IS ON A CURVE, THE NARROWEST PORTION OF THE PARKING STALL SHALL MEET THE WIDTH SHOWN.

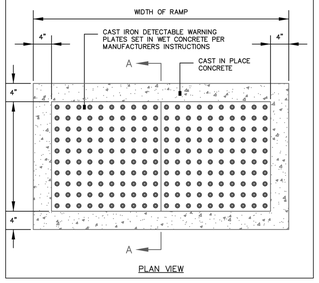
D STANDARD PARKING STALL STRIPING

N.T.S.

NOTES:



1. ALL DIMENSIONS SUBJECT TO MANUFACTURING TOLERANCE. RAIL ELEMENT MAY BE 12'-6" OR 25'-0" IN LENGTH.
2. CONTRACTOR SHALL FURNISH AND INSTALL GUIDERAIL, POSTS, FASTENERS, AND ALL NECESSARY PARTS REQUIRED TO COMPLETE THE INSTALLATION.

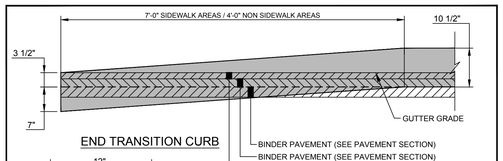


F STANDARD METAL GUIDERAIL DETAIL

N.T.S.

NOTES:

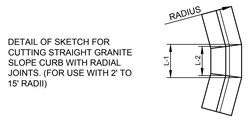
1. ALL DETECTABLE WARNING PLATES SHALL BE UNCOATED CAST IRON. FOLLOW MANUFACTURER'S INSTRUCTIONS FOR INSTALLATION.
2. CAST IN PLACE CONCRETE SHALL MEET SPECIFICATIONS FOR MDOT CLASS A STRUCTURAL CONCRETE, MINIMUM COMPRESSIVE STRENGTH 4,000 PSI. THE EXPOSED CONCRETE BORDER SHALL RECEIVE A UNIFORM BROOM FINISH PERPENDICULAR TO THE FLOW OF PEDESTRIAN TRAFFIC.
3. TRUNCATED DOMES SHALL BE ALIGNED IN ROWS, PARALLEL AND PERPENDICULAR TO THE PREDOMINANT DIRECTION OF TRAVEL. TRUNCATED DOME BRICKS AND GRANITE PAVERS ARE NOT ALLOWED.
4. SIZE: THE DETECTABLE WARNING PLATES SHALL EXTEND 24 INCHES MINIMUM IN THE DIRECTION OF TRAVEL AND THE FULL WIDTH OF THE CURB RAMP, LANDING, OR BLENDED TRANSITION TO THE STREET.
5. ORIENTATION: THE DETECTABLE WARNING PANEL SHALL BE LOCATED SO THAT THE EDGE NEAREST THE CURB LINE IS 6 INCHES MINIMUM AND 8 INCHES MAXIMUM FROM THE CURB LINE. THE PANEL SHALL BE ORIENTED TO THE DIRECTION OF TRAVEL AS IDENTIFIED BY THE POINT OF EGRESS.



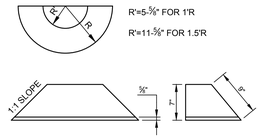
B SIDEWALK RAMP DETECTABLE WARNING PANEL

N.T.S.

AS OBTAINED FROM THE CITY OF PORTLAND "TECHNICAL MANUAL"



NOTES:



1. 4,000 PSI CONCRETE WITH FIBER REINFORCEMENT.
2. 4% TO 6% AIR ENTRAINMENT.
3. 1" TO 2" SLUMP.
4. APPLY EPOXY TO BINDER PAVEMENT PRIOR TO CURB PLACEMENT.
5. APPLY SALTGUARD™ OR EQUAL SALT INHIBITING TREATMENT.

NOTE:
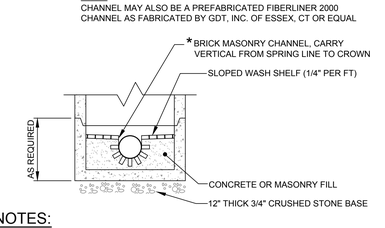
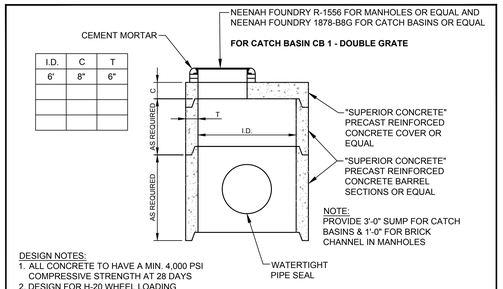
WHERE DEPTH OF COVER IS NOT SUFFICIENT TO USE CONCENTIC OR TRUNCATED CONE, A FLAT TOP MAY BE USED.



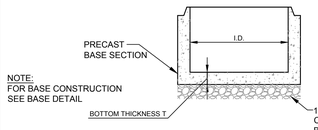
(A) 4'-0" PRECAST CATCH BASIN
N.T.S.

NOTE:
LOCATIONS AS NOTED ON PLANS - COORDINATE WITH ARCHITECTURAL AND / OR STRUCTURAL PLANS.



(D) TYPICAL FOUNDATION DRAIN DETAIL
N.T.S.

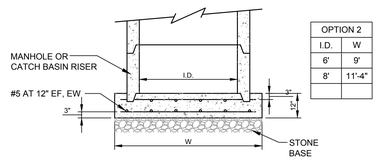
* NOTE:
CHANNEL MAY ALSO BE A PREFABRICATED FIBERLINER 2000 CHANNEL AS FABRICATED BY GDT, INC. OF ESSEX, CT OR EQUAL



NOTES:
1. BRICK CHANNEL TO BE AASHTO M-91-42 GRADE SA SEWER BRICK. *
2. MANHOLE TEST TO BE ACCOMPLISHED AFTER CHANNEL INSTALLATION IS COMPLETE.
3. WHERE THE ALIGNMENT CHANGES OR SIDE FLOW ENTERS THE MANHOLE, CONSTRUCT CHANNEL WITH A SMOOTH RADIAL CHANNEL TO ACCOMPLISH ALL JUNCTIONAL CHANGE OF ALIGNMENT WITHIN MANHOLE.

(H) MANHOLE BRICK CHANNEL INSTALLATION DETAIL
N.T.S.

DESIGN NOTES:
1. ALL CONCRETE TO HAVE A MIN. 4,000 PSI COMPRESSIVE STRENGTH AT 28 DAYS
2. DESIGN FOR H-20 WHEEL LOADING
3. CATCH BASIN TO CONFORM TO ASTM-C478 SPECIFICATIONS
4. REINFORCE TO .12 IN. SQ./L.F.



NOTE:
PROVIDE 3'-0" SUMP FOR CATCH BASINS & 1'-0" FOR BRICK CHANNEL IN MANHOLES

OPTION 1	
I.D.	T

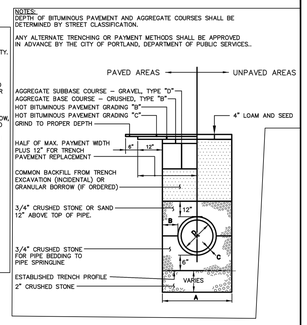
I.D.	W
6'	9'
8'	11'-4"

BASE DETAIL OPTION 2

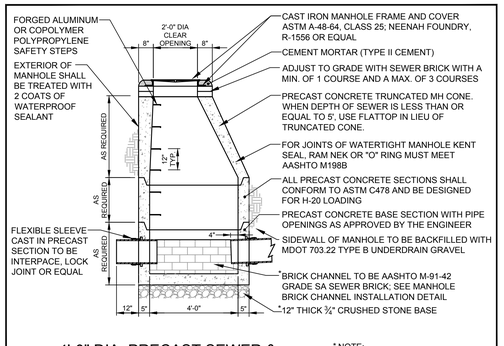
NOTE:
THE CONTRACTOR SHALL USE BASE OPTION 2 UNLESS ANTIFLOATATION COMPUTATIONS ARE PROVIDED BY THE CONTRACTOR DEMONSTRATING OPTION 1 CAN BE USED AT THIS SITE. APPROVAL IS SUBJECT TO REVIEW OF THE ENGINEER.



(B) LARGE DIAMETER STORM DRAIN MANHOLE AND CATCH BASIN WITH FLAT TOP
N.T.S.

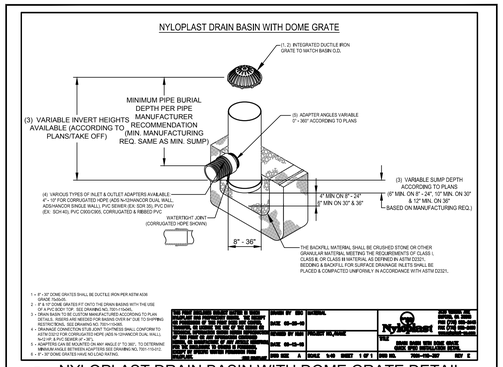
NOTES:
1. ALTERNATIVE CONSTRUCTION METHODS OR PAYMENT METHODS SHALL BE APPROVED IN ADVANCE BY THE CITY.
2. IN PAVED AREAS, DEPTHS OF GRAVEL AND HOT MIX ARE MINIMUMS. DEPTHS SHALL BE GREATER OF EXISTING CONDITIONS OR THE REQUIREMENTS FOR THE CORRESPONDING STREET CLASSIFICATION.
3. DIMENSION **B** SHALL BE SUFFICIENT TO ALLOW CRUSHED STONE BEDDING TO BE PLACED AND COMPACTED UNDER THE HAUNCHES OF THE PIPE, BUT IN ALL CASES DIMENSION **B** SHALL BE AT LEAST 9".
4. DIMENSION **A** IS THE MAXIMUM WIDTH ALLOWED FOR CALCULATING PAY QUANTITIES UNDER GRANULAR BORROW, CRUSHED STONE, STRUCTURAL EARTH EXCAVATION, AND STRUCTURAL ROCK EXCAVATION. DIMENSION **A** SHALL BE BASED ON PIPE DIAMETER **D**, AS SET FORTH IN THE FOLLOWING TABLE:

PIPE DIAMETER, D (INCHES)	MAX. TRENCH WIDTH, A (FEET)
4	4.0
6	4.0
8	4.0
10	4.0
12	5.0
15	5.0
18	5.0
21	5.0
24	6.0
27	6.0
30	6.0
36	6.0
42	7.0
48	7.0



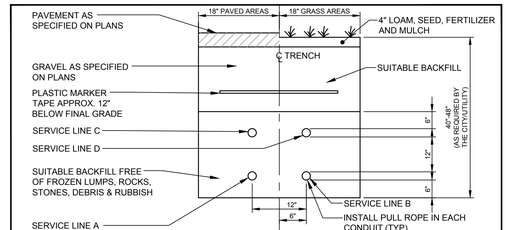
NOTE:
DEPTH OF BITUMINOUS PAVEMENT AND AGGREGATE COURSES SHALL BE DETERMINED BY STREET CLASSIFICATION.

ANY ALTERNATE TRENCHING OR PAYMENT METHODS SHALL BE APPROVED IN ADVANCE BY THE CITY OF PORTLAND, DEPARTMENT OF PUBLIC SERVICES..



(E) TYPICAL PIPE TRENCH INSTALLATION AND NOTES
N.T.S.

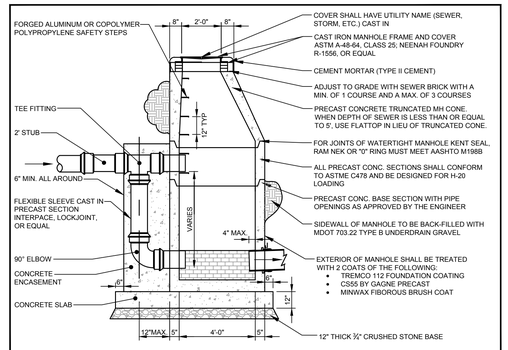
AS OBTAINED FROM THE CITY OF PORTLAND "TECHNICAL MANUAL"



(I) 4'-0" DIA. PRECAST SEWER & STORM DRAIN MANHOLE DETAIL
N.T.S.

* NOTE:
CHANNEL MAY ALSO BE A PREFABRICATED FIBERLINER 2000 CHANNEL AS FABRICATED BY GDT, INC. OF ESSEX, CT OR EQUAL

(M) NYLOPLAST DRAIN BASIN WITH DOME GRATE DETAIL
N.T.S.



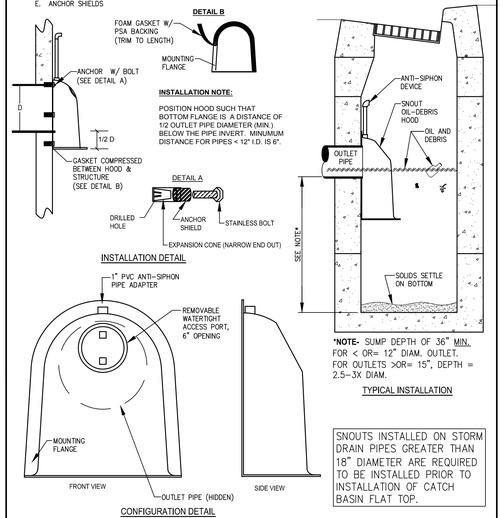
CONDUIT TYPE

SERVICE	CONDUIT SIZE	GRASS AREAS	PAVED AREAS	UTILITY	REMARKS
A	2-6"	SCHEDULE 40 PVC ELECTRICAL GRADE	RIGID GALVANIZED STEEL, ASTM A120*	POWER	SEE NOTE
B	2-4"	SCHEDULE 40 PVC	RIGID GALVANIZED STEEL, ASTM A120*	TELEPHONE	SEE NOTE
C	2-4"	SCHEDULE 40 PVC	RIGID GALVANIZED STEEL, ASTM A120*	COMMUNICATION	SEE NOTE
D	2-4"	SCHEDULE 40 PVC	RIGID GALVANIZED STEEL, ASTM A120*	SPARES	SEE NOTE

*AS REQUIRED BY CITY /UTILITY

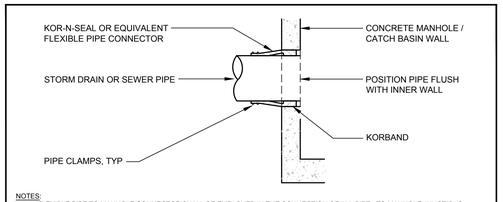
NOTES:
1. ONE CONDUIT CAPPED FOR SPARE, PROVIDE GALVANIZED STEEL LONG SWEEP AT RISER POLE AND EXTEND GALVANIZED CONDUIT TO 10' ABOVE GRADE AT POLE WITH STAND-OFF BRACKETS. COORDINATE WITH ELECTRICAL PLANS.
2. IN CITY RIGHT OF WAY, CONDUITS TO HAVE 36" MIN. COVER AND SHALL BE ENCASED WITH MIN. 3" CONCRETE ON ALL SIDES.

(F) UTILITY TRENCH - PRIMARY ELEC., TEL. & COMM.
N.T.S.



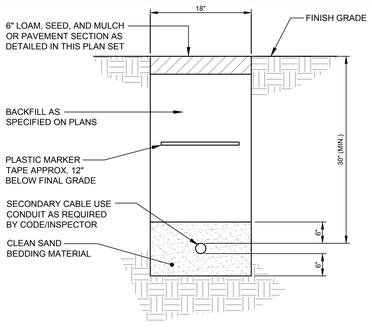
(J) 4'-0" DIA. DROP MANHOLE
N.T.S.

NOTES:
1. ALL HOODS AND TRAPS FOR CATCH BASINS AND WATER QUALITY STRUCTURES SHALL BE AS MANUFACTURED BY BEST MANAGEMENT PRODUCTS, INC. TOLL FREE: (800) 504- 8008 OR (888) 354- 7585 WEB SITE: www.bmpinc.com OR PRE-APPROVED EQUAL.
2. ALL HOODS SHALL BE CONSTRUCTED OF A GLASS REINFORCED RESIN COMPOSITE WITH ISO GEL COAT EXTERIOR FINISH WITH A MINIMUM 0.125" LAMINATE THICKNESS.
3. ALL HOODS SHALL BE EQUIPPED WITH A WATERTIGHT ACCESS PORT, A MOUNTING FLANGE, & AN ANTI-SIPHON VENT AS DRAWN. (SEE CONFIGURATION DETAIL)
4. THE SIZE AND POSITION OF THE HOOD SHALL BE DETERMINED BY OUTLET PIPE SIZE IN ACCORDANCE WITH THE FOLLOWING TABLE:



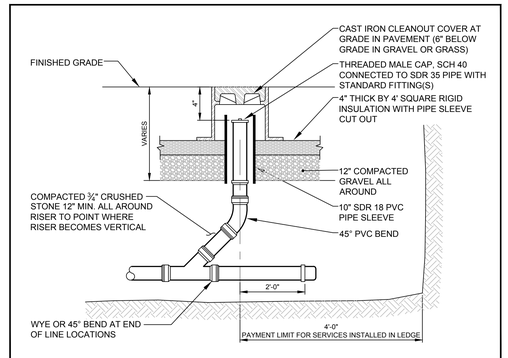
STRUCTURE OUTLET HOLE SIZE	SNOUT SIZE
11.9" O.D. OR LESS	12 F or R
12.0"–17.9" O.D.	18 F or R
18.0"–23.9" O.D.	24 F or R
24.0"–29.9" O.D.	30 F or R
30.0"–47.9" O.D.	48 F
48.0"–95.9" O.D.	96 F

5. THE BOTTOM OF THE HOOD SHALL EXTEND DOWNWARD A DISTANCE EQUAL TO 1/2 THE OUTLET PIPE DIAMETER WITH A MINIMUM DISTANCE OF 6" FOR PIPES <12" I.D.
6. THE ANTI-SIPHON VENT SHALL EXTEND ABOVE HOOD BY MINIMUM OF 3" AND A MAXIMUM OF 24" ACCORDING TO STRUCTURE CONFIGURATION.
7. THE SURFACE OF THE STRUCTURE WHERE THE HOOD IS MOUNTED SHALL BE FINISHED SMOOTH AND FREE OF LOOSE MATERIAL.
8. THE HOOD SHALL BE SECURELY ATTACHED TO STRUCTURE WALL WITH 3/8" STAINLESS STEEL BOLTS AND OIL-RESISTANT GASKET AS SUPPLIED BY MANUFACTURER. (SEE INSTALLATION DETAIL)
9. INSTALLATION INSTRUCTIONS SHALL BE FURNISHED WITH MANUFACTURER SUPPLIED INSTALLATION KIT, WHICH INCLUDES:
   A. INSTALLATION INSTRUCTIONS
   B. PVC ANTI-SIPHON VENT PIPE AND ADAPTER
   C. OIL-RESISTANT CRUSHED CELL FOAM GASKET WITH PSA BACKING
   D. 3/8" STAINLESS STEEL BOLTS
   E. ANCHOR SHIELDS



SNOUTS INSTALLED ON STORM DRAIN PIPES GREATER THAN 18" DIAMETER ARE REQUIRED TO BE INSTALLED PRIOR TO INSTALLATION OF CATCH BASIN FLAT TOP.

(N) SNOUT OIL-WATER-DEBRIS SEPARATOR DETAIL
N.T.S.



NOTES:
1. A FLEXIBLE PIPE TO MANHOLE CONNECTOR SHALL BE EMPLOYED IN THE CONNECTION OF ALL PIPE TO MANHOLE JUNCTIONS.
2. THE CONNECTOR SHALL BE KOR-N-SEAL AS MANUFACTURED BY NPC SYSTEMS, INC., OF MILFORD, NH OR EQUAL.
3. THE CONNECTOR SHALL BE THE SOLE ELEMENT RELIED ON TO ASSURE A FLEXIBLE WATERTIGHT SEAL OF THE PIPE TO MANHOLE NO ADHESIVES OR LUBRICANTS SHALL BE EMPLOYED IN THE INSTALLATION OF THE CONNECTOR TO THE MANHOLE. THE RUBBER FOR THE CONNECTOR SHALL COMPLY TO ASTM C443 AND ASTM C923 AND CONSIST OF EPDM AND ELASTOMERS KNOWN TO BE RESISTANT TO OZONE, WEATHER ELEMENTS, CHEMICALS, INCLUDING ACIDS, ALKALIS, ANIMAL AND VEGETABLE FATS, OILS AND PETROLEUM PRODUCTS FROM SPILLS.
4. ALL STAINLESS STEEL ELEMENTS OF THE CONNECTOR SHALL BE TOTALLY NON-MAGNETIC SERIES 304 STAINLESS, EXCLUDING THE WORM SCREW USED FOR TIGHTENING THE STEEL BAND AROUND THE PIPE WHICH SHALL BE SERIES 305 STAINLESS. THE WORM SCREW USED FOR TIGHTENING THE STEEL BAND SHALL BE TORQUED BY A BREAK-AWAY TORQUE WRENCH AVAILABLE FROM THE PRECAST MANHOLE SUPPLIER, AND SET AT 60/70 in/lbs.
5. THE CONNECTOR SHALL BE INSTALLED IN THE MANHOLE WALL BY ACTIVATING THE EXPANDING MECHANISM IN STRICT ACCORDANCE WITH THE RECOMMENDATION OF THE CONNECTOR MANUFACTURER.
6. THE CONNECTOR SHALL BE OF A SIZE SPECIFICALLY DESIGNED FOR THE PIPE MATERIAL AND SIZE BEING UTILIZED ON THE PROJECT.
7. ALL CONNECTORS WHICH ARE CAPPED AWAITING PIPE INSTALLATION AT A LATER DATE MUST BE RESTRAINED.

NOTE:
CONTRACTOR SHALL SUBMIT A DEWATERING PLAN TO THE OWNER SHOWING THE PROPOSED LOCATION OF DIRTBAGS™.

SPECIFICATIONS AND REQUIREMENTS FOR DEWATERING

THIS PROJECT WILL REQUIRE THE DISCHARGE OF CONSTRUCTION DEWATERING AND TURBID LADEN RUNOFF FROM THE SITE TO BE DIRECTED AND DISCHARGED THROUGH A DIRTBAG™. THIS DESCRIPTION ALSO CONTAINS APPENDED MATERIALS DESCRIBING THE **DIRTBAGS** REFERRED TO IN THIS NARRATIVE.

OVERVIEW:

DISCHARGE OF SEDIMENT-LADEN WATER FROM THE CONSTRUCTION SITE SHALL NOT BE ACCEPTABLE. TRADITIONALLY, MEDEP PERMITS HAVE HAD A STANDARD CONDITION WHICH STATES:

"THE APPLICANT SHALL TAKE ALL NECESSARY ACTIONS TO ENSURE THAT ITS ACTIVITIES OR THOSE OF ITS AGENTS DO NOT RESULT IN NOTICEABLE EROSION OF SOILS OR FUGITIVE DUST EMISSIONS ON THE SITE DURING THE CONSTRUCTION AND OPERATION OF THE PROJECT COVERED BY THIS APPROVAL."

SUITABLE METHODS OF FILTERING WATER FROM DEWATERING OPERATIONS, OR CONSTRUCTION SITE RUNOFF, SHALL BE EMPLOYED PRIOR TO DISCHARGE TO THE STORM DRAIN SYSTEM. ACCEPTABLE METHODS OF FILTERING INCLUDE DIRTBAGS™, SAND BERM FILTERS, SEDIMENTATION PONDS OR OTHER APPROVED METHODS AS DETAILED IN THE CURRENT EDITION OF THE MDEP "MAINE EROSION AND SEDIMENT CONTROL PRACTICES FIELD GUIDE FOR CONTRACTORS".

REQUIREMENTS FOR DIRTBAGS:

THE SITE CONTRACTOR SHALL INCLUDE THE PRICE OF DEWATERING AND FILTERING OF THE CONSTRUCTION DEWATERING PRIOR TO DISCHARGE. REMOVAL OF **DIRTBAGS™** AND DISPOSAL OF SEDIMENT SHALL BE INCLUDED IN THE PRICE.

AT ALL TIMES THERE MUST BE AN UNUSED DIRTBAG AVAILABLE FOR EMERGENCY USE.

AT ALL TIMES (AFTER INITIAL SITE PREPARATION), THE CONTRACTOR SHALL HAVE ONE **DIRTBAG** ACTIVE OR READY FOR USE. THE **DIRTBAG** SHALL BE INSTALLED ON A PREPARED SUBGRADE. THIS SUBGRADE SHALL CONSIST OF THE INSTALLATION OF A LAYER OF MIRAFI 600X, AND 18 INCHES OF ¾ INCH CRUSHED STONE. THE PLAN DIMENSION OF THE CRUSHED STONE PAD SHALL EXCEED THE PLAN AREA OF THE **DIRTBAG** BY AT LEAST TWO FEET IN ALL DIRECTIONS. THE **DIRTBAG** SHALL NOT BE INSTALLED ON AN UNDERLYING SLOPE OF GREATER THAN 15 PERCENT.

CONSTRUCTION DEWATERING OPERATIONS:

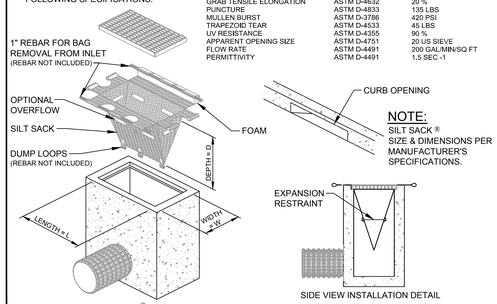
ALL CONSTRUCTION-DEWATERING OPERATIONS ARE THE RESPONSIBILITY OF THE SITE CONTRACTOR. IT SHALL BE THE SITE CONTRACTOR WHO IS RESPONSIBLE FOR SELECTING THE SITE FOR THE **DIRTBAG.**

WINTER OPERATIONS:

IN THE EVENT THAT WINTER OPERATIONS ARE REQUIRED, THE CONTRACTOR SHALL "POLY", ENCLOSE, AND PROVIDE TEMPORARY HEAT TO PREVENT THE **DIRTBAG** FROM SUBSTANTIAL FREEZING.

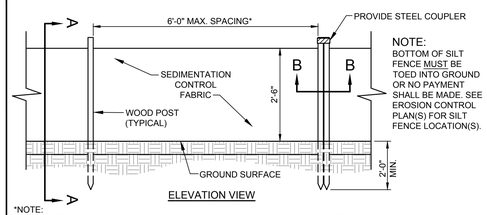
RECORD KEEPING

THE WEEKLY EROSION-SEDIMENT CONTROL REPORTS PREPARED IN ACCORDANCE WITH THE NPDES PERMIT SHALL MAINTAIN A LOG OF THE LOCATION, USE, AND REMOVAL OF **DIRTBAGS.** IN THE EVENT THAT THE STONE UNDER THE **DIRTBAG** BECOMES HIGHLY CONTAMINATED WITH FINES, THE NEXT **DIRTBAG** SHALL BE INSTALLED IN A DIFFERENT LOCATION.



D DIRTBAG® DETAIL AND SPECIFICATIONS
N.T.S.

NOTE: THE SILT SACK ® WILL BE MANUFACTURED FROM A WOVEN POLYPROPYLENE FABRIC THAT MEETS OR EXCEEDS THE FOLLOWING SPECIFICATIONS:



HIGH-FLOW SILT SACK ® (FOR USE IN LOW POINTS/SAGS)

(FOR AREAS OF MODERATE TO HEAVY PRECIPITATION AND RUN-OFF)

SECTION A-A

C SILTATION FENCE DETAIL
N.T.S.

NOTE:
DURING PERIODS OF WINTER CONSTRUCTION (NOV. 15 THROUGH APRIL 15), THE CONTRACTOR SHALL INSTALL EROSION CONTROL MIX BERMS IN LIEU OF SILT FENCE.

EROSION CONTROL MIX:

EROSION CONTROL MIX SHALL CONTAIN A WELL-GRADED MIXTURE OF PARTICLE SIZES & MAY CONTAIN ROCKS LESS THAN 4" IN DIAMETER. EROSION CONTROL MIX MUST BE FREE OF REFUSE, PHYSICAL CONTAMINANTS, AND MATERIAL TOXIC TO PLANT GROWTH. THE MIX COMPOSITION SHALL MEET THE FOLLOWING STANDARDS:

- THE ORGANIC MATTER CONTENT SHALL BE BETWEEN 80 AND 100%, DRY WEIGHT BASIS.
- PARTICLE SIZE BY WEIGHT SHALL BE 100% PASSING A 6" SCREEN AND A MINIMUM OF 70%, MAXIMUM OF 85%, PASSING A 0.75" SCREEN.
- THE ORGANIC PORTION NEEDS TO BE FIBROUS AND ELONGATED.
- LARGE PORTIONS OF SILTS, CLAYS OR FINE SANDS ARE NOT ACCEPTABLE IN THE MIX.
- SOLUBLE SALTS CONTENT SHALL BE < 4.0 mmhos/cm.
- PH SHALL FALL BETWEEN 5.0 AND 8.0.

1.3.5 Erosion Control Measures and Site Stabilization

The primary emphasis of the erosion/sedimentation control plan, which will be implemented for this project, is as follows:

- Development of a careful construction sequence.
- Rapid revegetation of denuded areas to minimize the period of soil exposure.
- Rapid stabilization of drainage paths to avoid rill and gully erosion.
- The use of on-site measures to capture sediment (hay bales/ stone check dams/silt fence, etc.)

The following temporary and permanent erosion and sediment control devices will be implemented as part of the site development. These devices shall be installed as indicated on the plans or as described within this report. For further reference, see the latest edition of the Maine Erosion and Sediment Control Practices Field Guide for Contractors.

A. Dewatering

Water from construction trench dewatering shall pass first through a filter bag or secondary containment structure (e.g. hay bale lined pool) prior to discharge. The discharge site shall be selected to avoid flooding, icing, and sediment discharges to a protected resource. In no case shall the filter bag or containment structure be located within 50 feet of a protected natural resource. Dewatering discharge shall not be directed across adjacent properties in a concentrated manner.
The Contractor shall submit to the project engineer, a dewatering plan for the pond dewatering that designates the dewatering process, a stable outlet location, and includes measures to prevent sediment discharges to the outlet location.

B. Inspection and Monitoring

Maintenance measures shall be applied as needed during the entire construction season. After each rainfall, snow storm or period of thawing and runoff, the site contractor shall perform a visual inspection of all installed erosion control measures and perform repairs as needed to insure their continuous function. Following the temporary and/or final seeding and mulching, the contractor shall in the spring inspect and repair any damages and/or unestablished spots. Established vegetative cover means a minimum of 90% of areas vegetated with vigorous growth.

The following standards must be met during construction.

(a) **Inspection and corrective action**. Inspect disturbed and impervious areas, erosion control measures, materials storage areas that are exposed to precipitation, and locations where vehicles enter or exit the site. Inspect these areas at least once a week as well as before and within 24 hours after a storm event (rainfall), and prior to completing permanent stabilization measures. A person with knowledge of erosion and stormwater control, including the standards and conditions in the permit, shall conduct the inspections.

(b) **Maintenance**. If best management practices (BMPs) need to be repaired, the repair work should be initiated upon discovery of the problem but no later than the end of the next workday. If additional BMPs or significant repair of BMPs are necessary, implementation must be completed within 7 calendar days and prior to any storm event (rainfall). All measures must be maintained in effective operating condition until areas are permanently stabilized.

(c) **Documentation**. Keep a log (report) summarizing the inspections and any corrective action taken. The log must include the name(s) and qualifications of the person making the inspections, the date(s) of the inspections, and major observations about the operation and maintenance of erosion and sedimentation controls, materials storage areas, and vehicles access points to the parcel. Major observations must include BMPs that need maintenance, BMPs that failed to operate as designed or proved inadequate for a particular location, and location(s) where additional BMPs are needed. For each BMP requiring maintenance, BMP needing replacement, and location needing additional BMPs, note in the log the corrective action taken and when it was taken.

The log must be made accessible to Department staff and a copy must be provided upon request. The permittee shall retain a copy of the log for a period of at least three years from the completion of permanent stabilization.

C. Temporary Erosion Control Measures

Temporary erosion control measures shall be installed by the Contractor as required by this report and as shown on the plan set for the project. Additional erosion control measures shall be installed if deemed necessary by on-site inspections of the Owner, the City of Portland, MDEP, or their representatives at no additional cost to the Owner.

The following measures are planned as temporary erosion/sedimentation control measures during construction:

1. Crushed stone-stabilized construction entrance shall be placed at any truck entrance to the project site from the existing paved access drives.

2. Siltation fence or wood waste compost berms shall be installed downstream of any disturbed areas to trap runoff- borne sediments until grass areas are revegetated. The silt fence and/or wood waste compost berms shall be installed per the details provided in this package and inspected at least once a week and before and immediately after a storm event of 0.5 inches or greater, and at least daily during prolonged rainfall. Repairs shall be made if there are any signs of erosion or sedimentation below the fence or berm line. If there are signs of undercutting at the center or the edges, or impounding of large volumes of water behind the fence or berm, the barrier shall be replaced with a stone check dam. Wood waste compost berms are not to be used adjacent to wetland areas that are not to be disturbed.

3. Straw or hay mulch including hydroseeding is intended to provide cover for denuded or seeded areas until revegetation is established. Mulch placed between April 15th and October 15th on slopes of less then 15 percent shall be anchored by applying water; mulch placed on slopes of equal to or steeper than 15 percent shall be covered by a fabric netting and anchored with staples in accordance with manufacturer's recommendation. Fabric netting and staples shall be used on disturbed areas within 50' of lakes, streams, and wetlands regardless of the upstream slope. Mulch placed between October 15th and April 15th on slopes equal to or steeper than 8 percent shall be covered with a fabric netting and anchored with staples in accordance with the manufacturer's recommendations. Slopes steeper than 3:1 and equal to or flatter than 2:1, which are to be revegetated, shall receive curlex blankets by American Excelsior or equal. Slopes steeper than 2:1 shall receive riprap as noted on the plans. The mulch application rate for both temporary and permanent seeding is 75 lbs per 1000 sf as identified in the seeding plan. Mulch shall not be placed over snow.

4. Temporary stockpiles of stumps, grubbings, or common excavation will be protected as follows:

a) Temporary stockpiles shall not be located within 100 feet of any wetlands which will not be disturbed and shall be located away from drainage swales.

b) Stockpiles shall be stabilized within 7 days by either temporarily seeding the stockpile by a hydroseed method containing an emulsified mulch tackifier or by covering the stockpile with mulch, such as hay, straw, or erosion control mix.

c) Stockpiles shall be surrounded by sedimentation barrier at the time of formation.

5. All denuded areas that are within 100 feet of an undisturbed wetland, which have been rough graded and are not located within a building pad, parking area, or access drive subbase area, shall receive mulch or erosion control mesh fabric within 48 hours of initial disturbance of soil. All areas within 100 feet of an undisturbed wetland shall be mulched prior to any predicted rain event regardless of the 48 hour window. In other areas, the time period may be extended to 7 days.

6. For work, which is conducted between October 15th and April 15th of any calendar year, all denuded areas, shall be covered with hay mulch or erosion control mix, applied at twice the normal application rate and anchored with a fabric netting. The time period for applying mulch shall be limited to 2 days for all areas.

7. The paved access drives shall be swept to control mud and dust as necessary. Additional stone shall be added to the stabilized construction entrance to minimize the tracking of material off the site and onto the surrounding roadways.

8. During grubbing operations stone check dams shall be installed at any evident concentrated flow discharge points and as directed on the Erosion Control Plans.

9. Silt fencing with a minimum stake spacing of 6 feet shall be used, unless the fence is supported by wire fence reinforcement of minimum 14 gauge and with a maximum mesh spacing of 6 inches, in which case stakes may be spaced a maximum of 10 feet apart. The bottom of the fence shall be anchored. A double row of silt fence shall be used adjacent to wetlands.

10. Wood waste compost/bark berms may be used in lieu of siltation fencing. Berms shall be removed and spread in a layer not to exceed 3" thick once upstream areas are completed and a 90% catch of vegetation is attained.

11. Storm drain catch basin inlet protection shall be provided through the use of stone sediment barriers or approved sediment bags (such as Silt Sack). Installation details are provided in the plan set. The barriers shall be inspected after each rainfall and repairs made as necessary. Sediment shall be removed and the barrier restored to its original dimensions when the sediment has accumulated to ½ the design depth of the barrier. The barrier shall be removed when the tributary drainage area has been stabilized.

12. Water and/or calcium chloride shall be furnished and applied in accordance with MDOT specifications - Section 637 - Dust Control.

13. Loam and seed is intended to serve, as the primary permanent revegetative measure for all denuded areas not provided with other erosion control measures, such as riprap. Application rates are provided in the seeding plan. Seeding shall not occur over snow.

D. Permanent Erosion Control Measures

The following permanent erosion control measures have been designed as part of the Erosion/Sedimentation Control Plan:

1. All areas disturbed during construction, but not subject to other restoration (paving, riprap, etc.) will be loamed, limed, fertilized, mulched, and seeded. Fabric netting, anchored with staples, shall be placed over the mulch in areas as noted in Temporary Erosion Control Measures paragraph 3 of this report. All areas within 100 feet of an undisturbed wetland shall be mulched prior to any predicted rain event regardless of the 48 hour window. Native topsoil shall be stockpiled and reused for final restoration when it is of sufficient quality.

2. All storm drain pipe outlets shall have riprap aprons at their outlet to protect the outlet and receiving channel from scour and deterioration. Installation details are provided in the plan set. The aprons shall be installed and stabilized to the extent practicable prior to directing runoff to the tributary pipe or culvert.

3. Catch basins shall be provided with sediment sumps and inlet hoods (the Snout) for all outlet pipes that are 18" in diameter or less.

1.4 Implementation Schedule

The following construction sequence shall be required to ensure the effectiveness of the erosion and sedimentation control measures are optimized:

It is anticipated that construction of the Hospital Expansion and related infrastructure will commence in Spring of 2020 and be completed by Winter of 2021.

Note: For all grading activities, the contractor shall exercise extreme caution not to overexpose the site, this shall be accomplished by limiting the disturbed area.

1. Install stabilized construction entrance at any truck entrance to the project site from a paved access drive.
2. Install perimeter silt fence and/or wood waste berms prior to grubbing respective areas.
3. Commence dewatering of the pond.
4. Excavate for wet pond permanent pool.
5. Clear and grub site. Install stone check dams at any evident concentrated flow discharge points.
6. Foundation area shall be excavated for installation of the building footings. Building work will be on going through the remainder of the project.
7. Commence installation of drainage appurtenances.
8. Commence earthwork and grading to subgrade.
9. Commence installation of water and sewer lines.
10. Continue earthwork and grading to subgrade as necessary for construction.
11. Complete installation of underground utilities to within 5' of the buildings.
12. Install light pole foundations and light poles.
13. Complete remaining earthwork operations.
14. Complete installation of catch basins and appurtenances.
15. Complete construction of wet pond.
16. Install sub-base and base gravel within parking fields, walkways, and all driveways.
17. Install curbing in parking fields, driveways, and along the streets as needed.
18. Install base course paving for access drive and parking area as well as concrete surfaces.
19. Loam, lime, fertilize, seed and mulch disturbed areas and complete all landscaping.
20. Install surface course paving for access drive and parking areas. Stripe per plan.
21. Once the site is stabilized and a 90% catch of vegetation has been obtained, remove all temporary erosion control measures.
22. Touch up loam and seed.

Note: All denuded areas not subject to final paving, riprap, or gravel shall be revegetated.

Prior to construction of the project, the contractor shall submit to the owner a schedule for the completion of the work, which will satisfy the following criteria:

1. The above construction sequence should generally be completed in the specified order; however, several separate items may be constructed simultaneously. Work must also be scheduled or phased to reduce the extent of the exposed areas as specified below. The intent of this sequence is to provide for erosion control and to have structural measures such as silt fence and construction entrances in place before large areas of land are denuded.

2. The work shall be conducted in sections which shall:

a) Limit the amount of exposed area to those areas in which work is expected to be undertaken during the proceeding 30 days.

b) Revegetate disturbed areas as rapidly as possible. All areas shall be permanently stabilized within 7 days of final grading or before a storm event; or temporarily stabilized within 48 hours of initial disturbance of soil for areas within 100 feet of an undisturbed wetland and 7 days for all other areas. Areas within 100 feet of an undisturbed wetland shall be mulched prior to any predicted rain event regardless of the 48 hour window.

c) Incorporate planned inlets and drainage system as early as possible into the construction phase. The ditches shall be immediately lined or revegetated as soon as their installation is complete.

1.5 Erosion, Sedimentation and Stabilization Control Plan

The Erosion Control Plan is included in the plan set.

1.6 Details and Specifications

The Erosion Control details and specifications are included in the plan set.

1.7 Winter Stabilization Plan

The winter construction period is from November 1 through April 15. If the construction site is not stabilized with pavement, a road gravel base, 75% mature vegetation cover or riprap by November 15 then the site needs to be protected with over-winter stabilization. An area considered open is any area not stabilized with pavement; vegetation, mulching, erosion control mats, riprap or gravel base on a road.

Winter excavation and earthwork shall be completed such that any area left exposed can be controlled by the contractor. Limit the exposed area to those areas in which work is expected to be under taken during the proceeding 15 days and that can be mulched in one day prior to any snow event.

All areas shall be considered to be denuded until the subbase gravel is installed in roadway/parking areas or the areas of future loam and seed have been loamed, seeded and mulched. Hay and straw mulch rate shall be a minimum of 150 lbs/1,000 s.f. (3 tons/acre) and shall be properly anchored.

The contractor shall install any added measures which may be necessary to control erosion/sedimentation from the site dependent upon the actual site and weather conditions. Continuation of earthwork operations on additional areas shall not begin until the exposed soil surface on the area being worked has been stabilized, in order to minimize areas without erosion control protection.

1. Soil Stockpiles

Stockpiles of soil or subsoil shall be mulched for over winter protection with hay or straw at twice the normal rate or at 150 lbs/1,000 s.f. (3 tons per acre) or with a four-inch layer of woodwaste erosion control mix. This shall be done within 24 hours of stocking and re-established prior to any rainfall or snowfall. Any soil stockpile shall not be placed (even covered with hay or straw) within 100 feet from any natural resources.

2. Natural Resource Protection

Any areas within 100 feet from any natural resources, if not stabilized with a minimum of 75% mature vegetation catch, shall be mulched by December 1 and anchored with plastic netting or protected with erosion control mats. During winter construction, a double line of sediment barriers (i.e. silt fence backed with hay bales or erosion control mix) shall be placed between any natural resource and the disturbed area. Projects crossing the natural resource shall be protected a minimum distance of 100 feet on either side from the resource. Existing projects not stabilized by December 1 shall be protected with the second line of sediment barrier to ensure functionality during the spring thaw and rains.

3. Sediment Barriers

During frozen conditions, sediment barriers shall consist of woodwaste filter berms as frozen soil prevents the proper installation of hay bales and sediment silt fences.

4. Mulching

An area shall be considered denuded until areas of future loam and seed have been loamed, seeded and mulched. Hay and straw mulch shall be applied at a rate of 150 lb. per 1,000 square feet or 3 tons/acre (twice the normal accepted rate of 75-lbs./1,000 s.f. or 1.5 tons/acre) and shall be properly anchored. Mulch shall not be spread on top of snow. The snow shall be removed down to a one-inch depth or less prior to application. After each day of final grading, the area shall be properly stabilized with anchored hay or straw or erosion control matting. An area shall be considered to have been stabilized when exposed surfaces have been either mulched with straw or hay at a rate of 150 lb. per 1,000 square feet (3 tons/acre) and adequately anchored that ground surface is not visible though the mulch.

Between the dates of November 1 and April 15, all mulch shall be anchored by peg line, mulch netting, asphalt emulsion chemical, or wood cellulose fiber. When ground surface is not visible through the mulch then cover is sufficient. After November 1st, mulch and anchoring of all bare soil shall occur at the end of each final grading workday.

5. Mulching on Slopes and Ditches

Slopes shall not be left exposed for any extended time of work suspension unless fully mulched and anchored with peg and netting or with erosion control blankets. Mulching shall be applied at a rate of 230 lbs/1,000 s.f. on all slopes greater than 8%.

Mulch netting shall be used to anchor mulch in all drainage ways with a slope greater than 3% for slopes exposed to direct winds and for all other slopes greater that 8%. Erosion control blankets shall be used in lieu of mulch in all drainage ways with slopes greater than 8%. Erosion control mix can be used to substitute erosion control blankets on all slopes except ditches.

6. Seeding

Between the dates of October 15 and April 1st, loam or seed will not be required. During periods of above freezing temperatures finished areas shall be fine graded and either protected with mulch or temporarily seeded and mulched until such time as the final treatment can be applied. If the date is after November 1st and if the exposed area has been loamed, fine graded with a uniform surface, then the area may be dormant seeded at a rate of 3 times higher than specified for permanent seed and then mulched. Dormant seeding may be selected to be placed prior to the placement of mulch and fabric netting anchored with staples. If dormant seeding is used for the site, all disturbed areas shall receive 4" of loam and seed at an application rate of 5 lbs/1,000 s.f. All areas seeded during the winter shall be inspected in the spring for adequate catch. All areas insufficiently vegetated (less than 75% catch) shall be revegetated by replacing loam, seed and mulch. If dormant seeding is not used for the site, all disturbed areas shall be revegetated in the spring.

Standards for Timely Stabilization of Construction Sites During Winter

1. Standard for the timely stabilization of ditches and channels -- The applicant shall construct and stabilize all stone-lined ditches and channels on the site by November 15. The applicant shall construct and stabilize all grass-lined ditches and channels on the site by September 1. If the applicant fails to stabilize a ditch or channel to be grass-lined by September 1, then the applicant will take one of the following actions to stabilize the ditch for late fall and winter.

Install a sod lining in the ditch -- The applicant shall line the ditch with properly installed sod by October 1. Proper installation includes the applicant pinning the sod onto the soil with wire pins, rolling the sod to guarantee contact between the sod and underlying soil, watering the sod to promote root growth into the disturbed soil, and anchoring the sod with jute or plastic mesh to prevent the sod strips from sloughing during flow conditions.

Install a stone lining in the ditch --The applicant shall line the ditch with stone riprap by November 15. The applicant shall hire a registered professional engineer to determine the stone size and lining thickness needed to withstand the anticipated flow velocities and flow depths within the ditch. If necessary, the applicant shall regrade the ditch prior to placing the stone lining so to prevent the stone lining from reducing the ditch's cross-sectional area.

2. Standard for the timely stabilization of disturbed slopes -- The applicant shall construct and stabilize stone-covered slopes by November 15. The applicant shall seed and mulch all slopes to be vegetated by September 1. The departments shall consider any area having a grade greater than 15% to be a slope. If the applicant fails to stabilize any slope to be vegetated by September 1, then the applicant shall take one of the following actions to stabilize the slope for late fall and winter.

Stabilize the soil with temporary vegetation and erosion control mats -- By September 1 the applicant shall seed the disturbed slope with winter rye at a seeding rate of 3 pounds per 1,000 square feet and apply erosion control mats over the mulched slope. The applicant shall monitor growth of the rye over the next 30 days. If the rye fails to grow at least three inches or cover at least 75% of the disturbed slope by November 1, then the applicant shall cover the slope with a layer of woodwaste compost as described in item iii of this standard or with stone riprap as described in item iv of this standard.

Stabilize the slope with sod -- The applicant shall stabilize the disturbed slope with properly installed sod by September 1. Proper installation includes the applicant pinning the sod onto the slope with wire pins, rolling the sod to guarantee contact between the sod and underlying soil, and watering the sod to promote root growth into the disturbed soil. The applicant shall not use late-season sod installation to stabilize slopes having a grade greater than 33% (3H:1V).

Stabilize the slope with woodwaste compost -- The applicant shall place a six-inch layer of woodwaste compost on the slope by November 15. Prior to placing the woodwaste compost, the applicant shall remove any snow accumulation on the disturbed slope. The applicant shall not use woodwaste compost to stabilize slopes having grades greater than 50% (2H:1V) or having groundwater seeps on the slope face.

Stabilize the slope with stone riprap -- The applicant shall place a layer of stone riprap on the slope by November 15. The applicant shall hire a registered professional engineer to determine the stone size needed for stability and to design a filter layer for underneath the riprap.

3. Standard for the timely stabilization of disturbed soils -- By September 15 the applicant shall seed and mulch all disturbed soils on areas having a slope less than 15%. If the applicant fails to stabilize these soils by this date, then the applicant shall take one of the following actions to stabilize the soil for late fall and winter.

Stabilize the soil with temporary vegetation -- By September 1 the applicant shall seed the disturbed soil with winter rye at a seeding rate of 3 pounds per 1000 square feet, lightly mulch the seeded soil with hay or straw at 75 pounds per 1000 square feet, and anchor the mulch with plastic netting. The applicant shall monitor growth of the rye over the next 30 days. If the rye fails to grow at least three inches or cover at least 75% of the disturbed soil before November 1, then the applicant shall mulch the area for over-winter protection as described below.

Stabilize the soil with sod -- The applicant shall stabilize the disturbed soil with properly installed sod by September 15. Proper installation includes the applicant pinning the sod onto the soil with wire pins, rolling the sod to guarantee contact between the sod and underlying soil, and watering the sod to promote root growth into the disturbed soil.

Stabilize the soil with mulch -- By November 15 the applicant shall mulch the disturbed soil by spreading hay or straw at a rate of at least 150 pounds per 1000 square feet on the area so that no soil is visible through the mulch. Prior to applying the mulch, the applicant shall remove any snow accumulation on the disturbed area. Immediately after applying the mulch, the applicant will anchor the mulch with plastic netting to prevent wind from moving the mulch off the disturbed soil.

1.8 Maintenance of facilities

The stormwater facilities will be maintained by the Applicant, Mercy Hospital or their assigned heirs. The contract documents will require the contractor to designate a person responsible for maintenance of the sedimentation control features during construction as required by the Erosion Control Report. Long-term operation/maintenance recommended for the stormwater facilities is presented below.

The responsible party may contract with such professionals, as may be necessary in order to comply with this provision and may rely on the advice of such professionals in carrying out its duty hereunder, provided, that the following operation and maintenance procedures are hereby established as a minimum for compliance with this section. A maintenance log of the inspections shall be kept by the responsible party.

Inspection and Maintenance Frequency and Corrrective Measures:
The following areas, facilities, and measures will be inspected and the identified deficiencies will be corrected. Clean-out must include the removal and legal disposal of any accumulated sediments and debris.

Catch Basins:
Inspect catch basins 2 times per year (preferably in Spring and Fall) to ensure that the catch basins are working in their intended fashion and that they are free of debris. Clean structures when sediment depths reach 12" from invert of outlet. If the basin outlet is designed with a hood to trap floatable materials (i.e. Snout), check to ensure watertight seal is working. At a minimum, remove floating debris and hydrocarbons at the time of the inspection.

Culverts:
Inspect culverts 2 times per year (preferably in Spring and Fall) to ensure that the culverts are working in their intended fashion and that they are free of debris. Remove any obstructions to flow; remove accumulated sediments and debris at the inlet, at the outlet, and within the conduit and repair any erosion damage at the culvert's inlet and outlet.

Inlet/Outlet Control Structures:
Inspect structures and piping 2 times per year (preferably in Spring and Fall) to ensure that the structures are working in their intended fashion and that they are free of debris. Remove any obstructions to flow; remove accumulated sediments and debris within the structure.

Stormdrain Outlets:
Inspect outlets 2 times per year (preferably in Spring and Fall) to ensure that the outlets are working in their intended fashion and that they are free of debris. Remove any obstructions to flow; remove accumulated sediments and debris at the outlet and within the conduit Repair any erosion damage at the stormdrain outlet.

Wet Pond:
Inspect pond 2 times per year (preferably in Spring and Fall) to ensure that it is working in its intended fashion and that it is free of trash and debris. Remove and properly dispose of any accumulated sediment or debris as needed. Inspect the embankments and spillways for settlement, slope erosion, and downstream swamping. Mow the embankment and/or vegetated spillway as needed to control woody vegetation. The facilities shall be inspected after major storms and any identified deficiencies shall be corrected.

Stone Bermed Level Lip Spreaders:
Inspect 2 times per year (preferably in Spring and Fall) to ensure that they are free of debris and no undesirable growth is impeding water flow through the berm. In addition, the stone bermed level lip spreaders shall be inspected to ensure that runoff is not bypassing the bermed spreader.

Vegetated Areas:
Inspect slopes and embankments early in the growing season to identify active or potential erosion problems. Replant bare areas or areas with sparse growth. Where rill erosion is evident, armor the area with an appropriate lining or divert the erosive flows to on-site areas able to withstand the concentrated flows. The facilities will be inspected after major storms and any identified deficiencies will be corrected.

Ditches, Swales and other Open Stormwater Channels:
Inspect 2 times per year (preferably in Spring and Fall) to ensure they are working in their intended fashion and that they are free of sediment and debris. Remove any obstructions to flow, including accumulated sediments and debris and vegetated growth. Repair any erosion of the ditch lining. Vegetated ditches will be mowed at least annually or otherwise maintained to control the growth of woody vegetation and maintain flow capacity. Any woody vegetation growing through riprap linings must also be removed. Repair any slumping side slopes as soon as practicable. If the ditch has a riprap lining, replace riprap on areas where any underlying filter fabric or underdrain gravel is showing through the stone or where stones have dislodged. Correct any erosion of the channel's bottom or sideslopes. The facilities shall be inspected after major storms and any identified deficiencies shall be corrected.

Roadways and Parking Surfaces: Clear accumulations of winter sand in parking lots and along roadways at least once a year, preferably in the spring. Accumulations on pavement may be removed by pavement sweeping. Accumulations of sand along road shoulders may be removed by grading excess sand to the pavement edge and removing it manually or by a front-end loader. Repair potholes and other roadway obstructions and hazards. Plowing and sanding of paved areas shall be performed as necessary to maintain vehicular traffic safety.

Recertification

As part of the Stormwater Permit, the applicant is required to meet the standards in Appendix B of the Chapter 500 Rules. Appendix B states that a project must submit a certification of the following to the department within three months of the expiration of each five-year interval from the date of issuance of the permit.
(a)Identification and repair of erosion problems. All areas of the project site have been inspected for areas of erosion, and appropriate steps have been taken to permanently stabilize these areas.
(b)Inspection and repair of stormwater control system. All aspects of the stormwater control system have been inspected for damage, wear, and malfunction, and appropriate steps have been taken to repair or replace the system, or portions of the system.
(c)Maintenance. The erosion and stormwater maintenance plan for the site is being implemented as written, or modifications to the plan have been submitted to and approved by the department, and the maintenance log is being maintained.
(d)Proprietary Systems. All proprietary systems have been maintained according to the manufacturer's recommendations. Where required by the Department, the permittee shall execute a 5-year maintenance contract with a qualified professional for the coming 5-year interval. The maintenance contract must include provisions for routine inspections, cleaning, and general maintenance.

Housekeeping

As part of the Stormwater Permit, the applicant is required to meet the standards in Appendix C of the Chapter 500 Rules. The following procedures are hereby established as a minimum for compliance with this section. For further information on the procedures listed below, refer to Chapter 500 rules - Appendix C.

Spill Prevention:
Appropriate spill prevention, containment, and response planning/implementation shall be used to prevent pollutants from being discharged from materials on site.

Groundwater Protection:
During construction, hazardous materials with the potential to contaminate groundwater shall not be stored or handled in areas of the site which drain to an infiltration area.

Fugitive Sediment and Dust:
Appropriate measures shall be taken to ensure that activities do not result in noticeable erosion of the soils and water and/or calcium chloride shall be used to ensure that activities do not result in fugitive dust emissions during or after construction.

Debris and Other Materials:
Litter, construction debris, and chemicals exposed to stormwater must be prevented from becoming a pollutant source.

Trench or Foundation De-watering:
Water collected through the process of trenching and/or de-watering must be removed from the ponded area, and must be spread through natural wooded buffers or other areas that are specifically designed to collect the maximum amount of sediment possible.

Non-stormwater Discharges:
Identify and prevent contamination by non-stormwater discharges.

.

SEEDING PLAN

Project: Mercy Hospital Expansion

Site Location: Portland, ME

☐ Permanent Seeding ☒ Temporary Seeding

1. Instruction on preparation of soil: Prepare a good seed bed for planting method used.
2. Apply lime as follows: _____# / acres, OR 138 # /M Sq. Ft.
3. Fertilize with _____ pounds of _____ N-P-K/ac. OR 13.8 pounds of 10-10-10 N-P-K/M Sq. Ft.
4. Method of applying lime and fertilizer: Spread and work into the soil before seeding.
5. Seed with the following mixture:
   50% Winter Rye
   50% Annual Rye
6. Mulching instructions: Apply at the rate of _____per acre, OR 75 pounds per M. Sq. Ft.

	Amount	Unit # Tons, Etc.
7. TOTAL LIME	138	#/1000 sq. ft.
8. TOTAL FERTILIZER	13.8	#/1000 sq. ft.
9. TOTAL SEED	1.03	#/1000 sq. ft.
10. TOTAL MULCH	75	#/1000 sq. ft.
11. TOTAL other materials, seeds, etc.		
12. REMARKS		

Spring seeding is recommended; however, late summer (prior to September 1) seeding can be made. Permanent seeding should be made prior to August 5 or as a dormant seeding after the first killing frost and before the first snowfall. If seeding cannot be done within these seeding dates, temporary seeding and mulching shall be used to protect the site. Permanent seeding shall be delayed until the next recommended seeding period.

1. THE APPLICANT WILL RETAIN THE SERVICES OF A PROFESSIONAL ENGINEER TO INSPECT THE CONSTRUCTION AND STABILIZATION OF ALL STORMWATER MANAGEMENT STRUCTURES. IF NECESSARY, THE INSPECTING ENGINEER WILL INTERPRET THE POND'S CONSTRUCTION PLAN FOR THE CONTRACTOR. ONCE ALL STORMWATER MANAGEMENT STRUCTURES ARE CONSTRUCTED AND STABILIZED, THE INSPECTING ENGINEER WILL NOTIFY THE MeDEP IN WRITING WITHIN 30 DAYS TO STATE THAT THE POND HAS BEEN COMPLETED. ACCOMPANYING THE ENGINEER'S NOTIFICATION MUST BE A LOG OF THE ENGINEER'S INSPECTIONS GIVING THE DATE OF EACH INSPECTION, THE TIME OF EACH INSPECTION, AND THE ITEMS INSPECTED ON EACH VISIT, AND INCLUDE ANY TESTING DATA OR SIEVE ANALYSIS DATA OF EVERY MINERAL SOIL AND SOIL MEDIA SPECIFIED IN THE PLANS AND USED ON SITE.
2. INSPECTION BY A PROFESSIONAL ENGINEER WILL CONSIST OF WEEKLY VISITS TO THE SITE TO INSPECT THE INSTALLATION OF EACH POND'S EMBANKMENT CONSTRUCTION, STORMWATER INLET AND OUTLET CONTROL STRUCTURE, FROM INITIAL GROUND DISTURBANCE TO FINAL STABILIZATION OF THE POND.
3. AN UNDERDRAINED GRAVEL TRENCH OUTLET IS NOT PROPOSED FOR THE OUTFLOW TRIBUTARY TO THE TIDAL FORE RIVER.

(G) CONSTRUCTION OVERSIGHT NOTE
